THE GILBERT & BARKER MANUFACTURING CO., SPRINGFIELD, Massachusetts, has issued a new and handsomely illustrated 28-page catalog of its oil storage systems, including tanks and measuring pumps. The outfits illustrated and described are in general use in factories, power plants and garages where lubricating oils and gasoline are handled.

"ASHLAND CHORDS" IS THE TITLE OF ONE OF THE LATEST HOUSE organs. "The Keynote of Ashland Tire and Rubber Company Harmony," as it is designated in the sub-title by its publisher. The Ashland Tire & Rubber Co., Ashland, Ohio. The first number, dated January, 1920, contains an account of the company's organization and progress in building, plans for selling and export, lists of officers and branch offices, the company's trade mark and a picture of the factory as it will look on completion.

HOLIDAY GREETINGS.

ONCE MORE HAS THE INDIA RUBBER WORLD received from the rubber and allied trades the cordial expressions of good will and appreciation, with kind wishes for the New Year. This publication takes this opportunity to return its thanks and to assure these friends that it heartily reciprocates their good wishes for progress and prosperity in this new year, which seems so full of promise for the rubber trade above all.

CALENDARS.

A beautiful and artistic water-color of a restful country scene adorns the calendar sent by Tyson Brothers, Inc., of Woodbridge, New Jersey, manufacturers of rubber substitutes and chemicals.

Another vivid war scene, "The flag that has never known defeat," representing boys in khaki going over the top, marks the calendar issued this year by Elmer E. Bast, Chicago, Illinois, manager of the Acme Belting Co., and of the United and Globe Rubber Co., Trenton, New Jersey.

Undoubtedly American is the strong face of Sachem Monati-

quot on the handsome calendar of the Monatiquot Rubber Works Co., of South Braintree, Massachusetts, for which we are indebted to Merton A. Turner.

From Manchester in England and the Rubber Regenerating Company at Trafford Park comes a fine reproduction of Seymour Lucas's painting, "A Whip for Van Tramp," showing the seventeenth century improvements in naval architecture.

A restful view of woods and river in color, "The Land of Dreams," adorns the calendar of F. E. Woodward & Sons, Lachine, Province of Quebec.

The J. H. Stedman Company, scrap rubber, of South Braintree, Massachusetts, revives pleasant memories of New England by decorating its calendar with a fine photograph of the "Old Town Mill" at North Scituate.

A handsome photograph of some of their buildings illustrates the large, decorative calendar of the Pierce Co., East Rochester, New York.

Large and instructive photographs of the remarkable work turned out by the Wellman-Seaver-Morgan Co., Cleveland, Ohio, builders of rubber and other machinery, marks the clear and practical calendar it issues.

Lockwood, Greene & Co., Boston, Massachusetts, illustrated their 1920 calendar with views of many buildings and other concrete constructions erected by the engineering firm throughout the country.

Pictures of the many diversified products of the General Electric Co., Schenectady, New York, from an electrified railroad to a new lamp bulb, illustrate the large and useful calendar which the company issues.

The Armstrong Rubber Co., Garfield, New Jersey, takes its super-size tire as model for both the shape and size of its striking calendar.

An elegant, enamelled, metallic frame backed with enameloid gives the American Zinc, Lead & Smelting Co.'s AZO calendar the appearance of permanence. The unusually helpful calendar for 1920, fastened by an ingenious zinc screw arrangement, can come off and make room for 1921 when the time comes.

An attractive young person brightens the calendar of the L. J. Mutty Co., Boston, Massachusetts, manufacturer of automobile top fabrics.

From F. R. Henderson & Co., Inc., New York City, in paper of crude rubber, comes a handsome, leather-covered, adjustable desk calendar.

George Borgfeldt & Co., New York City, importers, send a calendar of celluloid with convenient scales.

The H. F. Taintor Manufacturing Co., New York City, dealer in whiting, sends a card calendar.

The New Jersey Rubber Co., Lambertville, New Jersey, manufacturers of reclaimed rubber, again send us their very convenient desk calendar.

A pretty girl at the wheel of a motor car attracts the eye to the calendar issued by the Katzenbach & Bullock Co., New York City, manufacturer of chemicals and colors.

SOUVENIRS.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, through William H. Easton, sends a leatherbound, gilt-edged diary, containing useful tables and maps.

The Birmingham Iron Foundry, Derby, Connecticut, issues a leather-bound pocket memorandum book, provided with helpful tables.

The Morse Chain Company, Ithaca, New York, sends a leather-bound pocket diary with interesting information regarding its products.

John Royle & Sons, Paterson, New Jersey, makers of rubber and other machinery, send again their little leather-bound diary, with its many helpful tables and unusually convenient little maps.

From the Nylos Rubber Co., Limited, reclaimers of rubber, Trafford Park, Manchester, England, comes a handsome leather pocketbook, which holds also a booklet with detachable leaves for memoranda.

H. Muehlstein & Co., New York City, dealers in scrap rubber, provide again this year a handsome Russia leather satin-lined pocketbook for bank notes.

THE OBITUARY RECORD.

PRESIDENT OF THE GOODYEAR RUBBER INSULATING CO.

THEODORE WHITNEY BLAKE, president of the Goodyear Rubber Insulating Co., New York City, and also of the Whitney Blake Co., New Haven, Connecticut, died suddenly at his winter residence, 1067 Fifth avenue, New York City, on November 27, 1919, aged 54 years.

Born in Oakland, California, May 3, 1866, the son of Professor William Phipps Blake, mining engineer and state geologist, he came of an illustrious ancestry. His great-great-uncle was Eli Whitney, inventor of the cotton gin. His great-uncle, Eli Whitney Blake, invented the Blake stone crusher used all over the world today. His great-grandfather, Jonathan Mix, invented the elliptical spring for carriages and wagons. These are but a few of the inventions this gifted family gave to the world.

As a boy, Mr. Blake was educated at the Hopkins Grammar School, New Haven, Connecticut, his home being in that city. He graduated from the Sheffield Scientific School, Yale University, Class of 88, as one of the "Honored Ten," because he had performed some splendid original experiments in chemistry.

Beginning work with the American Bell Telephone Co. in New York City, he rose rapidly from one position to another, then went to Stone & Webster's in Boston, Massachusetts. From there he went to The National India Rubber Co., Bristol, Rhode Island. Then he started the Goodyear Rubber Insulating Co., in New York City, he and F. S. Minott becoming partners. By his own energy and ingenuity he built this up from a small concern into the business it is to-day, and in 1912 he founded The Whitney Blake Co., at New Haven, Connecticut.

In 1900 he married Lillian Kaisley, daughter of Major Kaisley, U. S. A., and is survived by her, a daughter, Charlotte Hayes Blake, and a son, Kaisley Blake.

A man of remarkable energy and enthusiasm, broad vision and high ideals, clear judgment and unflinching optimism, ingenious with machinery and resourceful in its practical application, he was of the highest type of American business man. In New Haven, where most of his home life was spent, he was public spirited and associated with all that stood for real progress. Greatly did he love humanity, and deeply was he loved in return.

A CHICAGO TIRE DEALER.

Frank A. Williams, president of the Carlsen-Williams Co., Chicago, Illinois, well-known dealers in tires, died of pneumonia on December 18, 1919. He was born in Chicago in 1883 and had a public school education. At thirteen he entered the service of the Hartford Rubber Works as an errand boy and worked his way up until the company was absorbed by the United States Tire Co., in 1911. He then helped to organize the Carlsen-Williams Co., of which he was president from the beginning.

SPECIALIST IN INDUSTRIAL RELATIONS.

George Weston, a brother of Joseph C. Weston, vice-president of the Ajax Rubber Co., Inc., New York City, died in Philadelphia, January 7, 1920, after a brief illness. Mr. Weston was a well-known engineer, and a specialist in railway valuation and industrial relations. His recent paper on "The Adjustment of Industrial Relations," which appeared in the technical and lay press, earned for him well-merited recognition.

KNOWN TO MANY RUBBER MANUFACTURERS.

Word comes from Germany of the death in 1917 of Professor George S. Atwood, for a long time secretary of the American Association of Commerce and Trade in Berlin. Professor Atwood was an American of New England, and at one time one of the faculty of Bowdoin College, Maine.

In 1906 he went to Germany as a teacher of English. He married and settled in Berlin, later being instrumental in founding the very excellent association of which he was secretary.

RUBBER IN BASE BALLS.

The actual manufacture of a ball begins with the formation of a piece of cork into a piece about the size of, and resembling, a marble. These pieces are previously examined and weighed and those not up to the required specifications are discarded. In the meantime, in another part of the factory, rubber is being molded into hemispheres that enclose the cork center, and are vulcanized.

The center is now ready for winding with wool yarn, the wool having been imported from Australia in the raw state in bales and put through the various operations of yarn making. The gage of the yarn and the tension under which it is wound must be exact, otherwise the ball will exceed the proper size.

When the wool yarn has been wound to almost the regulation size of the ball it is finished off with a winding of strong cotton thread, and an application of rubber cement given. The ball is

(A. G. Spalding & Bros.)

BASEBALL WITH CORK AND RUBBER CENTER.

now ready for its cover, which is sewn on by hand. The sewers, who work with awl and the strongest cotton thread, stretch on the two pieces of horsehide, the latter having been in preparation for at least sixteen weeks, and it is then given a final inspection before the box is sealed.

Some of the details that enter into the making of a baseball will be of interest, for instance: the cover measures approximately 25 square inches and is cut with special dies, only the best part of the horsehide being used. The length of the blue and white wool yarn windings, if stretched out in a single string, would measure over 400 yards, nearly a quarter of a mile.

Although the ball in a general way has followed the same specifications for many years, it was not until 1910 that the cork center was introduced which has since justified all the claims made for it.

To assert that too much rubber in a ball would tend to make it dead seems ridiculous, but such was the case, and the remedy was discovered in the introduction of a small piece of cork the center of what heretofore had been a solid piece of rubber. ("Spalding's Journal of American Sports.")

PENANG, DURING THE ELEVEN MONTHS ENDED NOVEMBER 30, 1919, exported to Great Britain 208,115 pounds of crude rubber and to the United States, 121,734 pounds.

The National Automobile Shows.

THE LAMBERT ANNUAL NATIONAL AUTOMOBILE SHOW, under the auspices of the National Automobile Chamber of Commerce, was held in New York City, January 3 to 10. Passenger cars were exhibited at the Grand Central Palace and trucks at the New York 8th Coast Artillery Armory. At this year's show there were listed in the catalog 84 makers of passenger cars, 74 of trucks, and 284 manufacturers of accessories. Unquestionably the exhibition was the largest and most successful so far held.

A notable feature of the show was the increased use over last year of disk and steel wheels on both passenger cars and trucks. The superiority of such wheels over those built of wood has been fully demonstrated by transport experience during the war and apparently will be more widely adopted each year, especially for the heavier cars and trucks, as is said to be the general rule on cars of European manufacture.

ACCESSORIES AT THE PASSENGER CAR SHOW.

Of special interest among the accessory exhibits the following may be mentioned:

AUTO PEDAL PAD CO. Molded rubber foot pads for pedal operation.

AUTOMATIC SAFETY TIRE VALVE CORP. The Lock-on air chuck, a device for use in making a secure air connection with the valve for inflation of the tire.

BREEZE MANUFACTURING CO. Flexible metallic tubing.

L. C. CHASE & CO. Automobile topping, robes, mohair velvets, etc.

COFFIELD TIRE PROTECTOR CO. A crescent-shaped endless pure gum protector to be placed between the tube and the tire tread. The effect is to deflect nails from penetrating the tube by means of a yielding thick mass of well-cured rubber.

COMPRESSION TUBE & TIRE CORP. A specially molded high-grade inner tube so shaped as to hold air after puncture by reason of the compressive strain exerted on the tread and side wall portions of the tube by the inflation pressure.

EASTERN RUBBER CO. Magic Mend, a self-curing plastic rubber composition adapted to close permanently small punctures in inner tubes, water bottles or similar soft rubber articles.

ESSENKAY PRODUCTS CO. Tire-sifting solid composition as a substitute for air-inflated inner tubes.

ESSEX RUBBER CO. High quality red inner tubes and molded accessories.

GENERAL ELECTRIC CO. Fabril gears. These consist of a cotton-filler compressed under hydraulic pressure of several tons

per square inch, of side surface and held in compression by steel shrouds or side plates and threaded studs passing entirely through. Mazda lamps, and the Tungar apparatus for recharging batteries.

KEYSTONE RUBBER MFG. CO. Tire accessories, cement, patches and inner tubes.

MORSE CHAIN CO. Silent chain for transmitting power from gear to gear in front end drives in a variety of applications.

L. J. MUTTY CO. Driedk automobile topping; single and double-texture rubber waterproofed cloths.

GEO. H. REVES MANUFACTURING CO. Auto pedal pads.

A. SCHRADER'S SON, INC. Tire valves, pressure gauges and special connections.

C. A. SHALER CO. Electrically operated apparatus for sectional repair vulcanizing.

STORY RUBBER CORP. Bonner inner tubes, having one ply fabric on thickened rubber tread, the surface of which supports compression under pressure and prevents leaks.

TITIFLEX METAL HOSE CORP. Flexible metal tubing without sliding joints for carburetor, exhaust, muffler and conduit connections.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO. Rectigon battery chargers, Mazda lamps, air compressors and portable electric instruments.

METAL WHEEL EQUIPMENT FOR SOLID AND PNEUMATIC TIRES WAS THE FEATURE OF THE SHOW.

ACCESSORIES AT THE TRUCK SHOW.

JAXON STEEL PRODUCTS CO. A full floating wheel wherein the axle is carried by a disk supported on six pure rubber molded wheels which absorb the road shocks encountered by the surrounding steel rim solid tire.

LAMBERT TRUBERUF TIRE CO. A laminated solid tire built up with double plies of picioned duck alternating with thick layers of rubber composition. The latter being pierced crosswise of the treadway by large holes in the two lower layers and staggered upper with lower, thus making a non-puncturable resilient wheel.

SEWELL CUSHION WHEEL CO. A composite wood and rubber wheel tired with an ordinary solid rubber tire. The construction includes a compressible bridge-like molded strip of resilient rubber held between the parts of a double felloe, faced each side by a molded ring of rubber held in place by bolted-on rings.

WELLMAN-SEEVER-MORGAN CO. Exhibited their tire-applying press, adapted for heavy hydraulic duty in mounting and demounting solid rubber tires.

News of the American Rubber Trade.

DIVIDENDS.

The Archer Cord Tire Sales Co., Louisville, Kentucky, has declared a six per cent cash dividend and a ten per cent stock dividend. Checks for the cash dividend, which is payable quarterly on stock of record December 20, 1919, were mailed January 15, 1920, and will be mailed at corresponding times hereafter. The stock dividend is payable to stock of record July 15.

The Brunswick-Balke-Coller Co., Chicago, Illinois, has declared the first quarterly dividend for 1920 on the common stock, at one and three-quarters per cent, payable February 15 on stock of record February 5, 1920.

The Electric Rubber Reclaiming Co., Barberton, Ohio, has declared and paid January 1, 1920, its regular quarterly dividend of one and three-quarters per cent on preferred stock.

The Hood Rubber Co., Watertown, Massachusetts, has declared its regular quarterly dividend of one and three quarters per cent, payable February 2 on preferred stock of record January 20, 1920.

The India Tire & Rubber Co., Mogadore, Ohio, has declared a stock dividend of forty per cent, payable January 2, 1920.

The Kelly-Springfield Tire Co., New York City, has declared the following dividends: regular quarterly, \$1 per share, and stock dividends of three per cent on common stock, both payable February 2 on stock of record January 17; also quarterly dividend of \$2 per share on eight per cent preferred stock, payable February 16 on stock of record February 2, 1920.

The Sterling Tire Corp., Rutherford, New Jersey, has declared the regular quarterly dividend at the rate of seven per cent per annum, for the three months ended December 31, 1919, payable by check mailed January 15, 1920, to shareholders of record December 31, 1919.

The Portage Rubber Co., Barberton, Ohio, has declared a dividend of two per cent on its common stock.

The Rochester Tire and Rubber Co., Buffalo, New York, has declared the regular semi-annual dividend of seven per cent on outstanding preferred stock. This company has authorized a change in its name to "The Powerstown Tire Corporation."

The Standard Underground Cable Co., Pittsburgh, Pennsylvania, has declared the following dividends: quarterly, three per cent; extra, three per cent; and special, three per cent; all payable January 10 on stock of record January 3, 1920.

The United States Rubber Co., New York City, has declared the following dividends: quarterly, two per cent, on common and preferred stock of record January 15, payable January 31; twelve and one-half per cent stock dividend, payable February 19 on common stock of record February 19, 1920.

FINANCIAL NOTES.

At the regular quarterly meeting of the directors of The B. F. Goodrich Co., held January 21, 1920, a dividend of 3½ per cent was declared on the preferred stock, 1¼ per cent payable April 1, 1920, to the preferred stockholders of record at the close of business March 22, 1920, and 1¼ per cent payable July 1, 1920, to preferred stockholders of record at the close of business June 21, 1920. An additional dividend of ½ per cent was declared on the common stock, which, with the dividend of 1 per cent declared at the meeting of October 15, 1919, makes a total dividend of 1½ per cent payable on February 16, 1920, to the common stockholders of record at the close of business February 5, 1920. A dividend of 1½ per cent was also declared on the common stock, payable on May 15, 1920, to the common stockholders of record at the close of business May 5, 1920.

The directors voted, subject to the approval of the stockholders at their annual meeting March 10, 1920, to retire 11,880 shares of the preferred stock prior to July 1, 1920, in accordance with the requirements of the Charter.

THE FIRESTONE TIRE & RUBBER CO. STATEMENT.

The annual report of the Firestone Tire & Rubber Co. for the fiscal year ended October 31, 1919, shows consistent growth in volume of business and profits. The sales for the year were \$91,078,513, against \$75,801,506 for the preceding year, an increase of \$15,277,006, or 20 per cent. The profits for the year, after allowances for depreciation and deducting bad accounts, were \$9,306,978, of which \$2,597,787 was paid as dividends, the balance being placed to surplus subject to income and profits tax accrued. It was announced at the annual meeting that an extra dividend of \$2 per share would be paid to stockholders of record December 15, and that it was hoped to put each quarterly dividend on that basis.

During the year the capital stock of the company was increased from \$15,000,000 to \$75,000,000, divided into \$10,000,000 of 6 per cent preferred stock, \$40,000,000 of 7 per cent preferred stock and \$25,000,000 of common stock. Of the increased capital thus authorized, \$10,000,000 has been sold, approximately half of it to employees of the company. Firestone sales are now moving at the rate of \$150,000,000 a year, and that is the goal set for the present year.

The balance sheet as of October 31, 1919, follows:

ASSETS.	
Lands, buildings, machinery and equipment.....	\$18,820,214.82
Net sound book value.....	
Investments in miscellaneous stocks and bonds.....	895,804.50
Current assets:	
Finished and in-process goods and materials and supplies.....	\$24,159,519.58
Cash.....	3,749,744.40
United States Liberty Loan and Victory Bonds—market value.....	1,264,216.56
Accounts and notes receivable.....	15,645,416.71
Total current assets.....	44,818,897.25
House and lot accounts receivable and unsold real estate of the Coventry Land and Improvement Co.....	3,812,409.77
Due from employees on account of purchase of common capital stock and sundry advances.....	5,004,811.38
Stock purchases are secured by deposit of stock as collateral.....	
Expenditures applicable to future operations.....	401,460.83
Total.....	\$73,753,598.55
LIABILITIES.	
Preferred, 6%, cumulative capital stock.....	\$10,000,000.00
Authorized issue \$10,000,000.....	
Preferred, 7%, cumulative capital stock.....	10,000,000.00
Authorized issue \$40,000,000.....	
Common capital stock.....	3,500,000.00
Authorized issue \$25,000,000.....	
Current liabilities:	
Notes and acceptances payable.....	\$5,812,691.06
Accounts payable.....	3,336,517.81
Accrued salaries, wages, taxes, etc.....	1,639,869.56
Subscription to United States Victory Bonds—unmatured installments.....	238,700.00
Total current liabilities.....	11,027,778.43
Mortgages and notes payable of the Coventry Land and Improvement Co.....	1,899,112.00
Reserves:	
For welfare work and pensions.....	\$1,341,638.83
For insurance losses.....	\$34,530.49
Total reserves.....	1,376,169.32
Surplus.....	\$35,490,538.80
Total.....	\$73,753,598.55

*Subject to provision for corporation income and profits tax accrued for the year ended October 31, 1919.

NOTE—The Firestone Tire & Rubber Co. has a contingent liability as endorser on \$130,388.53 of notes and trade acceptances receivable, discontinued.

The directorate elected by the stockholders is as follows: Harvey S. Firestone, A. C. Miller, L. E. Sisler, S. G. Carlshuff, J. C. Robertson, J. W. Thomas, Harvey S. Firestone, Jr., A. G. Partridge, C. A. Meyers and Thomas Clements. The officers re-elected are Harvey S. Firestone, president; A. C. Miller, vice-president and general counsel; S. G. Carlshuff, secretary; J. G. Robertson, treasurer. Three new vice-presidencies were created, as follows: A. G. Partridge, vice-president, in charge of sales;

J. W. Thomas, vice-president, in charge of manufacturing; Thomas Clements, vice-president, in charge of offices and purchases.

ANNUAL BALANCE SHEET OF THE FISK RUBBER CO.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has recently issued its annual balance sheet for the year ended September 30, 1919, which shows the following figures:

ASSETS.	
Capital assets:	
Land	\$171,629.54
Buildings	93,734.93
Machinery	2,714,145.51
Plant equipment	340,084.19
At branch:	
Land	1,721,628.88
Buildings	93,734.93
Leasehold	4,523.19
Equipment	608,310.14
	958,197.67
Total replacement value	\$10,836,182.10
Reserve for depreciation	1,721,628.88
Sound value of capital assets	\$9,114,553.21
Good will	8,000,000.00
	\$17,114,553.21
Investments:	
Miscellaneous, including Federal Rubber Co., 25,500 shares	\$230,001.00
Current assets:	
Raw materials and supplies at cost or less	\$3,968,056.16
Work in process at cost	728,123.45
Finished stock at cost	9,652,332.62
Accounts receivable, less reserve	9,316,650.40
Notes	71,458.72
Collateral notes—employees' subscriptions to capital stock	93,277.26
Cash	3,675,810.95
United States Liberty Bonds collateral to loan, per contract	\$2,754,700.00
Less officers' and employees' payments	210,153.50
	2,544,546.50
	\$30,050,256.04
Deferred charges:	
Prepaid rents, royalties, local taxes, interest and insurance	\$84,246.78
Stationery and office supplies	38,026.24
Other prepaid expenses	143,887.20
	266,160.22
*Leasehold property is our Pittsburgh branch located on leased land, being charged off during the period of lease.	\$47,660,974.57
LIABILITIES.	
Capital stock:	
7 Per cent cumulative first preferred—Authorized and issued: 150,000 shares, par \$100	\$15,000,000.00
Less purchased for retirement, 5,000 shares, par \$100	500,000.00
	\$14,500,000.00
7 Per cent cumulative second preferred convertibles—Authorized 70,000 shares, par \$100	\$7,000,000.00
Less 20,955 shares, par \$100, converted into common stock	2,095,500.00
	4,904,500.00
Outstanding 49,045 shares, par \$100	4,904,500.00
Authorized 800,000 shares, par \$25	\$20,000,000.00
Unissued 480,000 shares, par \$25	12,000,000.00
Issued 320,000 shares, par \$25	8,000,000.00
Issued 114,380 shares, par \$25, for conversion of first preferred convertible and second preferred stocks	2,859,500.00
Outstanding 434,380 shares, par \$25	10,850,500.00
Total capital stock outstanding	\$30,264,000.00
Current liabilities:	
Loans payable	\$1,616,000.00
Accounts payable	2,830,601.74
Accrued taxes and wages	276,476.14
Loans payable, per contract—United States Liberty Bonds	2,149,500.00
	\$6,906,577.78
Balance of 1918 Federal income and war taxes (due December 15, 1919)	\$356,547.15
Excess of appraisal value of capital assets over book value at March 31, 1919	\$1,027,931.86

Reserves:	
Reserve for branch insurance liability assumed by company	\$103,297.90
Reserve for mileage guarantee	100,416.58
Reserve for contingencies	32,679.75
Reserve for 1919 Federal income and war taxes	839,879.74
	\$1,096,773.97
Surplus:	
Balance at December 31, 1918	\$4,425,923.35
Surplus at reported for retirement of old first preferred stocks restored to general surplus	1,938,542.19
Premium received on sale of 25,000 shares second preferred stocks	875,000.00
Miscellaneous income, including \$191,000 resulting from conversion of first preferred convertible stock into common stock on basis 5 for 1	195,689.85
Profit January 1, 1919, to September 30, 1919, per schedule 7	4,199,399.06
	\$11,634,554.45
Deduct:	
Dividends declared (first preferred stock to August 1, 1919)	\$492,796.58
Dividends declared (second preferred stock to September 1, 1919)	215,774.00
Provision for Federal income and war taxes	1,012,641.70
Premium paid for retirement of old issue of first preferred stock and commissions paid underwriters of new first preferred and second preferred stocks	1,878,995.55
Miscellaneous expenses in connection with issue and sale of new first preferred and second preferred stocks	25,202.81
	\$3,625,410.64
Balance	\$8,009,143.81
	\$47,660,974.57

The Hood Rubber Co., Watertown, Massachusetts, has formed a new subsidiary company under the name of Hood Products Co., Inc., which will deal in all kinds of rubber and leather goods, has been incorporated under Massachusetts laws with an authorized capital of \$1,500,000, consisting of 10,000 preferred and 5,000 common shares. The preferred dividends will be cumulative at 7 per cent.

Sales of the Mason Tire & Rubber Co. for its third fiscal year, ended October 31, 1919, amounted to \$3,468,858.52, with a net profit of \$223,705.52. This is an increase of about 50 per cent over the preceding year's totals. During the past few months the company has opened ten additional direct factory branches in the United States, making eighteen in operation. The goal is a \$7,000,000 business during the present fiscal year.

DUNLOP AMERICA LIMITED TO BUILD TIRE PLANT AT BUFFALO.

Dunlop America Limited has been incorporated, and will acquire all the rights of the original American Dunlop Tire Co. About 150 acres of land at Buffalo, New York, have been purchased, upon which will be erected a tire plant of the most modern kind. Cord fabric, which will be exclusively used, will be spun, twisted and woven from the raw cotton in a specially designed fabric plant on the Buffalo site. The Dunlop company believes in specialization and, therefore, with the exception of the Dunlop golf ball, its production will be confined to high-grade pneumatic cord and solid truck tires.

Dunlop America Limited as an American company will be operated by an American staff. The board will include a strong American element, as well as some of the chief members of the board of the British company, and will have the benefit of a full interchange of patents and technical processes with the British and other Dunlop companies, as well as the services free of cost of an advisory committee constituted from the expert staff of the British organization. The names of the directors and executive officers of Dunlop America Limited will be announced later.

SAVOLD TIRE REORGANIZATION.

The Savold Tire Corporation, New York City, which was incorporated early in 1919, and whose stocks had such an erratic career on the New York curb market, has been thoroughly reorganized in order that full advantage might be taken of existing possibilities. Those who formerly controlled its policies have stepped aside and a new personnel is now in charge.

THE PENNSYLVANIA RUBBER CO.

The Pennsylvania Rubber Co., which was incorporated in May, 1899, by Herbert Du Puy and others, began business in Erie, Pennsylvania, where it bought up the business of the Keystone Rubber Co. and the plant of the Erie Rubber Co., one of the pioneers in the trade, going back to the '80s. Three years later the plant was moved to Jeannette, Pennsylvania, on the Pennsylvania Railroad, twenty-six miles from Pittsburgh, where since 1902 it has gone on manufacturing belting, packing, hose, all kinds of rubber goods, particularly tennis balls and tires, at first for bicycles and carriages, then when the automobile came, for motor cars.

The business has expanded greatly in late years under the management of Seneca G. Lewis, so that four years ago the INDIA RUBBER WORLD published a picture of the improvements in the plant. At the end of 1917 the capital of the company was increased to \$6,000,000.

The illustration gives some idea of the remarkable expansion of the business of the company in the past few years by the comparison of the original factory with the present plant.

It also shows to some extent the buildings which the company is putting up to secure the welfare and comfort of its employees.

The company employed 460 hands in 1910, and turned out 120 motor tires a day and as many tubes. This year the number of employees is 2,849, the daily output of automobile tires is 3,000, and of bicycle tires 3,000 also, while 5,500 automobile tubes are turned out. The company manufactures, besides, a greater number of tennis balls than any other concern in America.

The new buildings now being constructed will treble the present production. The company has also purchased two hundred acres of ground, extending from the factory to the Lincoln

wick, New Jersey. Agent in charge, R. E. Watson. To buy, sell, and generally deal in automobile tires, tubes, etc.

Berman Tire Co., Inc., January 12, 1920 (New York), \$5,000,000. 1 Shavelson, 1019 Flatbush avenue; M. E. Levine, 1150 President st., both in Brooklyn; S. Berman, 242 West 48th street, New York City. To deal in tires.

Burness, Archer & Roberts, Inc., December 30, 1919 (New York), \$20,000. W. Burrows, 63 Park Row, New York City; W. L. Archer, Mt. Vernon; E. S. Roberts, Crestwood—all in New York. To manufacture tires and rubber goods.

Carlisle Tire Corp., November 13, 1919 (Delaware), \$3,000,000. J. S. Bretz; H. Von Briesen; E. M. Simpson—all of New York. To manufacture tires, casings, etc.

Corona Cord Tire Co., November 26, 1919 (Pennsylvania), \$500,000. T. Phillips, Jr., president; H. B. Callahan, vice-president; C. H. Miller, secretary and treasurer; J. V. and E. Ritts, B. D. Phillips and A. O. Fisher, directors. Principal office, East Butler, Pennsylvania. To manufacture good tubes and inner tubes.

Dixie Rubber Co., November 26, 1919 (Mississippi), \$1,000,000. T. J. Graham, Indiana; J. W. Peyton and J. M. Clower—both of Dyer; E. K. Case, Sunflower; L. C. Cadenhead, Mahan—all in Mississippi; N. C. Elliott and T. Kirk—both of Memphis, Tennessee. Principal office, Jackson, Mississippi. To manufacture, buy and sell automobile tires and inner tubes and rubber goods, etc.

Doyle-Gearhart Tire Co., October 1, 1919 (California), \$25,000. H. S. Doyle; J. W. Gearhart; P. H. Bottoms. Principal office, Fresno, California. To deal in automobile tires and accessories.

Elasti-Cap Co., The, September 25, 1919 (New Jersey), \$125,000. J. C. Farr, president, 735 Tenth street; J. B. Hamilton, vice-president, 1110 Park avenue; E. C. Farr, treasurer, 939 Washington street—all of Hoboken; A. T. Bruce, secretary, 789 Jackson Road, North Bergen—both in New Jersey. Principal office, 702 Clinton street, Hoboken, New Jersey. Agent in charge, W. C. Farr. To manufacture and sell mechanical and electrical goods and devices and particularly a patented rubber splice-insulator known as "Elasti-Cap" to replace the rubber elastic tape now used for end-splices in fixtures, outlet boxes, etc.

F. & G. Tire Co., Inc., December 30, 1919 (New York), \$5,000. W. P. Fraley, Jamaica; L. A. Giegerich, Jr., Riverdale on Hudson; C. J. Brown, Great Neck—all in New York. To deal in tires.

Globe Webbing Co., Inc., January 3, 1920 (New York), \$30,000. L. Pearlman, 26 West 43rd street; G. W. Covert, 274 East 165th street, both in New York City; E. H. Pearlman, 285 St. Johns Place, Brooklyn—all in New York. To manufacture webbing, etc.

Grand Rapids Tire & Rubber Corp., January 7, 1920 (Michigan), \$3,000,000. F. G. Withrow; M. J. Goldin, both of Grand Rapids; L. A. Brown, Alto—all in Michigan. To manufacture automobile tires, etc.

Howe Rubber Corp., September 29, 1919 (Delaware), \$18,000,000. T. L. Croton; S. E. Dill—all of Wilmington, Delaware. To import, export and deal in crude and refined rubber and other products.

PLANT OF THE PENNSYLVANIA RUBBER CO., JEANNETTE, PENNSYLVANIA.

Highway, on which it plans to build 1,200 houses for the workmen; 71 of these houses in "Parusio Park" are already finished or are nearing completion.

NEW INCORPORATIONS.

Allen Tire & Rubber Co., December 30, 1919 (Delaware), \$1,000,000. M. L. Harty; S. L. Mackey; M. C. Kelly—all of Wilmington, Delaware.

Andover Rubber Co., November 17, 1919 (Massachusetts), \$300,000. A. A. Gleason; J. J. Higgins, both of 60 State street, Boston; F. B. Carlisle, Andover—all in Massachusetts. Principal office, Andover, Massachusetts. To manufacture and deal in automobile tires.

Arrow Tire & Rubber Co., October 20, 1919 (Delaware), \$50,000. C. B. Bishop; S. H. Baynard, Jr.; A. M. Fox—all of Wilmington, Delaware. Delaware agent, Delaware Charter Co., 904 Market street, Wilmington, Delaware. To manufacture and deal in supplies for automobiles, etc.

Becker & Rolfe, Inc., December 10, 1919 (New Jersey), \$50,000. C. N. Becker; J. C. Rolfe, both of New Brunswick; R. E. Watson, Highland Park—all in New Jersey. Principal office, 41 Paterson street, New Brun-

swick, New Jersey. Agent in charge, R. E. Watson. To buy, sell, and generally deal in automobile tires, tubes, etc.

Berman Tire Co., Inc., January 12, 1920 (New York), \$5,000,000. 1 Shavelson, 1019 Flatbush avenue; M. E. Levine, 1150 President st., both in Brooklyn; S. Berman, 242 West 48th street, New York City. To deal in tires.

Burness, Archer & Roberts, Inc., December 30, 1919 (New York), \$20,000. W. Burrows, 63 Park Row, New York City; W. L. Archer, Mt. Vernon; E. S. Roberts, Crestwood—all in New York. To manufacture tires and rubber goods.

Carlisle Tire Corp., November 13, 1919 (Delaware), \$3,000,000. J. S. Bretz; H. Von Briesen; E. M. Simpson—all of New York. To manufacture tires, casings, etc.

Corona Cord Tire Co., November 26, 1919 (Pennsylvania), \$500,000. T. Phillips, Jr., president; H. B. Callahan, vice-president; C. H. Miller, secretary and treasurer; J. V. and E. Ritts, B. D. Phillips and A. O. Fisher, directors. Principal office, East Butler, Pennsylvania. To manufacture good tubes and inner tubes.

Dixie Rubber Co., November 26, 1919 (Mississippi), \$1,000,000. T. J. Graham, Indiana; J. W. Peyton and J. M. Clower—both of Dyer; E. K. Case, Sunflower; L. C. Cadenhead, Mahan—all in Mississippi; N. C. Elliott and T. Kirk—both of Memphis, Tennessee. Principal office, Jackson, Mississippi. To manufacture, buy and sell automobile tires and inner tubes and rubber goods, etc.

Doyle-Gearhart Tire Co., October 1, 1919 (California), \$25,000. H. S. Doyle; J. W. Gearhart; P. H. Bottoms. Principal office, Fresno, California. To deal in automobile tires and accessories.

Elasti-Cap Co., The, September 25, 1919 (New Jersey), \$125,000. J. C. Farr, president, 735 Tenth street; J. B. Hamilton, vice-president, 1110 Park avenue; E. C. Farr, treasurer, 939 Washington street—all of Hoboken; A. T. Bruce, secretary, 789 Jackson Road, North Bergen—both in New Jersey. Agent in charge, W. C. Farr. To manufacture and sell mechanical and electrical goods and devices and particularly a patented rubber splice-insulator known as "Elasti-Cap" to replace the rubber elastic tape now used for end-splices in fixtures, outlet boxes, etc.

Newtown, N. J., Jan. 12, 1919 (New York), \$100,000. M. M. Burnett, 19 East Ninth street; J. F. Brandenberg, 111 West Eleventh street, both of New York City; G. A. Senior, Arlington, New Jersey. To manufacture tires.

Pasadena Rubber Cloth Co., The, December 18, 1919 (New Jersey), \$506,000. N. F. Bowman; T. S. Cart, both of Mt. Vernon, New York; R. H. Gulliver, Trenton, New Jersey. Principal office, 137 East State street, Trenton, New Jersey. Agent in charge, F. R. Brace. To manufacture rubberized cloth and other fabrics.

Portage Tire & Rubber Co., January 7, 1920 (New York), \$100,000. S. B. Howard; G. V. Reilly, Jr., & Thistle—all of New York. To deal in rubber tires, etc.

Puncture-Proof Pneumatic Tire Protector, Inc., October 1, 1919 (Delaware), \$75,000. S. B. Howard; A. V. Britton, G. V. Reilly—all of New York. To manufacture and sell devices of all kinds for the protection of tires.

Ramo Tire & Rubber Co., September 23, 1919 (Delaware), \$1,000,000. S. G. and D. Bear and C. K. Water—all of Pittsburgh, Pa. To manufacture and sell tires and tubes.

Red Seal Rubber & Cement Co., The, December 4, 1919 (New Jersey), \$250,000. George B. and Clarence A. Wilson, both of 19 Burgess place; W. A. Wilson, Second and South streets—all of Passaic; J. H. Smith, Jr., 157 West 47th street, New York City. Principal office, Second and South streets, Passaic, New Jersey. Agent in charge, C. A. Wilson. To manufacture, buy and sell all kinds of patent rubber, cement, etc.

Rosbach & Bros., J. H., September 15, 1919 (Delaware), \$4,000,000. H. R. Limburg; W. A. Hirsch; W. J. Mayer—all of New York. To deal in hides, skins, rubber goods, etc.

Rubber Trading Co., Inc., September 26, 1919 (Delaware), \$500,000. T. L. Croteau; H. E. Knox; S. E. Dill—all of Wilmington, Delaware. To import and export rubber, etc.

Sinclair Rubber Co., Inc., September 16, 1919 (New York), \$25,000. C. M. Pyle, president; I. J. Solomon, vice-president; E. P. Brown, secretary and treasurer. Principal office, 1679 Broadway, New York City. To remold tires.

Slohm Tire & Mould Co., Inc., January 8, 1920 (New York), \$10,000. H. Radovich; L. Slohm; W. Hartsberg—all of Buffalo, New York. Principal office, Buffalo, New York. To manufacture tires.

Tomah Rubber Works, September 24, 1919 (Wisconsin), \$25,000. L. Hofmeister, president and treasurer, 174 Sixteenth street; C. E. Gage, vice-president, 851 Eleventh street; M. E. Prentiss, secretary, 1101 North avenue—all of Milwaukee, Wisconsin. Principal office, Milwaukee, Wisconsin. To manufacture, buy, sell and deal in rubber tubes, tires, and rubber specialties.

Union Rubber & Asbestos Co., January 3, 1920 (New Jersey), \$50,000. D. M. Lovett, Trenton, New Jersey; C. H. Swager, Pittsburgh; J. M. Shear and R. A. Mackie—both of Bradford; H. M. Prill and D. W. Mackie—both of Warren—all three in Pennsylvania. Principal office, 224 South Warren street, Trenton, New Jersey. Agent in charge, D. M. Lovett. To manufacture, buy, sell and deal in all goods, merchandise, and articles made wholly or in part of rubber.

Universal Rubber Goods Co., October 30, 1919 (Delaware), \$1,000,000. A. W. Britton; S. B. Howard; G. V. Reilly—all of Wilmington, Delaware. To manufacture and build tires of rubber or metal.

Weinman Elastic Web Co., October 17, 1919 (New York), \$50,000. L. Weinman; J. P. Segal; H. Danziger—all of 258 Broadway, New York City. To manufacture auto, tire, and webbing.

West Side Auto Tire & Supply Co., November 28, 1919 (New Jersey), \$25,000. Walter and Thomas Troy, both of 226 Wilkinson avenue; W. Russ, 444 Jersey avenue—all of Jersey City, New Jersey. Principal office, 740 West Side avenue, Jersey City, New Jersey. Agent in charge, W. Russ. To deal in auto, tires, etc.

Wieg Tire Corp., January 5, 1920 (New York), \$100,000. C. and M. E. Wieg, both of Sully, New Jersey; B. W. Everett, 1 Nassau street, New York City. To manufacture tires, etc.

VICE-PRESIDENT IN CHARGE OF SALES.

A. G. PARTRIDGE, recently elected vice-president in charge of sales and a director of the Firestone Tire & Rubber Co., Akron, Ohio, has been in the tire business since his infancy. Born in Jamestown, New York, he began his rubber career with the Diamond Rubber Co., Akron, Ohio, in 1899.

Six years later, while in charge of the New York Diamond branch, he resigned to join the Firestone sales force. His advancement thereafter was rapid. In 1911 he was appointed assistant sales manager, in which capacity he visited the principal cities of the country developing new avenues of trade and promoting enthusiasm among the branch offices. On the election of R. J. Firestone to a vice-presidency in 1916, Mr. Partridge succeeded him as general sales manager, which position he held during the company's greatest growth and up to his own election to the directorate. He has been well prepared for his larger responsibilities by those he has carried for the company in the past, and his election is in accord with the Firestone policy of advancing

A. G. PARTRIDGE.

men who have made good. His entire career has been in sales work, and in that side of the firm's activities he will continue.

JOHN W. THOMAS, VICE-PRESIDENT.

JOHN W. THOMAS, newly elected vice-president in charge of manufacturing of the Firestone Tire & Rubber Co., Akron, Ohio, has been with the company for twelve years. He has been

works manager for some time and responsible for production since 1911. Having made his way up through the production end of the plant, he is well fitted for his larger work by intimate knowledge, experience and conspicuous ability.

A native son of the Buckeye State, Mr. Thomas was born in Tallmadge, Ohio, in 1880. He spent his boyhood days on a farm, entering Buchtel Academy at the age of 17, and completing his education at Buchtel College, from which he graduated in 1904 with a degree of Ph. B. Shortly after graduation he entered the laboratory of The B. F. Goodrich Co., Akron, Ohio, where he spent three

years in research and experimental work. In January, 1908, he joined the Akron, Ohio, organization of the Firestone Tire & Rubber Co. and installed its laboratory, where he served as chemist for two years, going thence to the manufacturing department, serving an apprenticeship in one tire manufacturing unit after another, and becoming manager of one of the departments. In 1911 he was appointed superintendent of the factory, and in 1916 he was elected a member of the board of directors of the company. As chairman of the solid tire division of the War Service Committee of the Rubber Industry of the U. S. A. he has earned the gratitude of the trade. Mr. Thomas makes his home in Akron, is married and has four children, two boys and two girls. He is a member of the Congregational Church, of the Lone Star Fraternity, the Portage Country Club, Akron City Club, Rotary Club, Ohio Society of New York, Society of Automotive Engineers, Knights of Pythias, and the Akron Chamber of Commerce, of which last organization he is a director.

PERSONAL MENTION.

Victor W. Fink, for the last ten years connected with the Rubber Importers' & Dealers' Co., Inc., New York City, has been placed in charge of the crude rubber department of the firm of E. S. Kuh & Valk Co., Produce Exchange Building, New York City.

R. W. Wheeler, Bush Terminal, Brooklyn, New York, has been appointed representative in the State of New York for the Cleveland Osborn Manufacturing Co., authorized to do business in New York.

Thomas F. Hetherman, formerly connected with Neuss Hessel & Co., Inc., on January 1 formed a new corporation with Robin & de Laurant, under the name of Hetherman & Co., Inc., at 487 Broadway, New York City, as a broker specializing in Far Eastern produce.

J. E. Mayl, who has been New England district sales manager of the Firestone Tire & Rubber Co., Akron, Ohio, with headquarters in Boston, has been promoted to Eastern sales manager with headquarters in New York City, replacing Lewis G. Fairbanks, who has been elected vice-president and general manager of the Firestone Steel Products Co., manufacturers of rims, etc.

J. V. Mowe, formerly assistant general sales manager of the Kelly-Springfield Tire Co., has been promoted to the position of general sales manager, succeeding Otis R. Cook, who has been connected with the company for the past nine years and has been vice-president and general sales manager for the past six years. Mr. Cook will remain in Cleveland, Ohio, looking after special work for the company as well as cooperating with the financial interests in New York City, and will retain all of his stock in the corporation and remain on the board of directors.

W. H. Bell has been appointed assistant general sales manager of the Kelly-Springfield Tire Co.

EASTERN AND SOUTHERN NOTES.

The Kelly-Springfield Tire Co. is about to commence the erection of a 16-story office building in New York City, to which it will remove the general sales department which has been located in Cleveland, Ohio, and where the executive offices of the company will be established.

The Beacon Tire Co., Inc., Beacon, New York, has completed its three-story addition and equipped it with machinery of the latest type.

The Burnet-Webb Tire Corp., 518 South Clinton street, Syracuse, New York, has taken over exclusively the Syracuse branch of the Sterling Tire Corp., Rutherford, New Jersey, where, in addition to the wholesale distribution of Sterling tires and tubes, it will retail standard makes of tires, tubes, and accessories. The officers of the company are: William E. Housel, president; Arthur E. Webb, vice-president in charge of territorial dealer business; J. H. Burnet, secretary and treasurer in charge of sales and service.

The Mutual Tire & Rubber Co., New York City, has opened at Springfield, Massachusetts, and New Haven, Connecticut, retail and sporting goods departments in its branches in those cities. The company operates a chain of automobile tire, accessory, and supply stores.

The Forrest Tire & Rubber Co., Shubert Building, Philadelphia, Pennsylvania, has been incorporated under the laws of Delaware with 1,000,000 shares of fully paid and non-assessable shares of common stock at a par value of \$1, with the following officers: R. E. Connor, president; Olie T. Alveberg, vice-president; Abraham Mitnick, secretary and treasurer. Rudolph Shlifer is general manager and Samuel G. Grossley, engineer.

The Archer Cord Tire Sales Co., Louisville, Kentucky, at its recent annual meeting elected the following officers: W. F. Bigelow, president (reelected); W. A. Bieter, vice-president; Maurice Hessian, secretary and treasurer; Frederick Graham, chairman of the executive committee.

The Dixie Rubber Co., 768-770 Randolph Building, Memphis, Tennessee, recently incorporated under the laws of Mississippi, expects to begin construction of its plant in Memphis in April. Arrangements for the building and equipment have been completed and the company hopes to begin production of cord and fabric tires and inner tubes in the autumn.

FOOTWEAR PRICES INCREASE.

Price announcements on footwear made on January 1 by the United States Rubber Co. for the current year show an average increase of approximately twenty per cent on the full line.

On January 1, 1919, the company's footwear prices were reduced, the average cut for the whole line being about five per cent. This price reduction followed closely the decrease in the cost of materials that came soon after the signing of the armistice. During the past year the cost of these materials mounted to even higher levels than during the war, and the increase in footwear prices which has recently gone into effect is a result of the higher cost of materials and labor.

Taking the five per cent reduction of a year ago into consideration, the average increase in price for the two-year period of 1919-1920 is only fifteen per cent.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON NOTES.

THE MANAGERS AND FOREMEN of the Thermoid Rubber Co., Trenton, recently held their second annual banquet and entertainment at Hildebrecht's. T. A. Welger, superintendent of the factory, was presented with a handsome amethyst ring by his foremen. Members of the committee in charge comprised John Coleman, T. A. Welger, A. D. Nevins and E. L. Royal.

The Trenton rubber manufacturers responded liberally to the fund raised for the poor children of Trenton during the holiday season. The children were given an entertainment in a local theater and each one presented with pretty gifts.

The recent round-up of "Reds" in Trenton and vicinity found but a handful of radicals employed in the rubber plants, and these men were finally released by the Government authorities.

The Puritan Rubber Manufacturing Co., whose plant on Perrine avenue, Trenton, was recently destroyed by fire, has taken out a building permit for the erection of new works on the old site. The building will be one story brick, 28 by 128 feet in size, and will cost \$7,500.

The Luzerne Rubber Co., Trenton, has purchased a tract of land, 200 by 200 feet, opposite its works on Muirhead avenue and intends later to enlarge the plant.

The Joseph Stokes Rubber Co., Trenton, has contributed \$250 to the police pension fund of Trenton.

Alfred Whitehead, secretary of the Whitehead Brothers Rubber Co., has been ill at his home in Trenton.

The seventy caddies employed at the Trenton Country Club were recently given a dinner at the club, where gifts were also presented. John A. Lambert, treasurer and general manager of the Acme Rubber Manufacturing Co., acted as chairman of the affair.

William J. R. Stokes, treasurer of the Thermoid Rubber Co., Trenton, has been appointed a member of the Trenton Sinking Fund Commission. Mr. Stokes was formerly city treasurer of Trenton.

The Union Rubber & Asbestos Co. has been incorporated and has opened an office at 224 South Warren street, Trenton. The company will deal in mechanical rubber goods and asbestos products of all kinds, especially the rubber goods used in the oil business. The officers of the new concern are: Donald W. Mackie, president; J. M. Shear, vice-president; Charles E. Day, sales manager; Harry M. Prill, treasurer; Charles H. Swoger, secretary, and D. M. Lovett, general manager. Mr. Swoger has been in the rubber business for the past twenty years. The company will soon employ a force of salesmen in Pennsylvania and the southwestern oil districts, as well as in other parts of the country.

Horace B. Tobin, secretary and treasurer of the United & Globe Rubber Co., Trenton, has been made a director of the Standard Fire Insurance Company.

The Crescent Insulated Wire & Cable Co., Trenton, will build on recently acquired property a one-story factory addition of steel and concrete, 50 by 125 feet, to cost, with equipment, about \$40,000.

The Netherlands Gutta Percha Co., Singapore, manufacturer of rubber goods, has let a contract in Trenton for a large supply of transfer patterns for the stamping of tubes and radiator hose.

MISCELLANEOUS NEW JERSEY NOTES.

The Overman Cushion Tire Co., Belleville, New Jersey, has plans drawn for a two-story factory, 64 by 120 feet, at Cortlandt and Rutgers streets.

The Rydon Tire & Rubber Co. has let a contract for the erection of a brick and steel factory building at Fourth and Railroad avenues, Asbury Park, New Jersey, to cost \$100,000. The structure will be 73 by 185 feet.

The Pocono Rubber Cloth Co., manufacturers of rubberized cloth for automobile tops and various specialties, has purchased the plant of the Howard Demountable Rim Co., in Hamilton Township, New Jersey, and will establish a large factory there. The property consists of three acres and a manufacturing plant 90 by 170 feet. The Pocono company has also obtained options on adjoining lands along the main line of the Pennsylvania Railroad for future use. The plant cost the Pocono company \$45,000. About 100 hands will be employed.

Brighton Mills, Inc., Passaic, New Jersey, has devised a service button for employees who remain with the company and serve full time except for illness or other excusable absence. The button given at the end of one year is of blue enamel with gilt lettering; second year, bronze; fifth year, silver; tenth year, gold. The design consists of the monogram "B. M." in a central circle; the words "Brighton Mills" in an intermediate one; and the words "Loyalty," "Cooperation," and "Fellowship" in the outermost one which is indented between the words.

TRENTON RUBBER MANUFACTURERS' ASSOCIATION.

This association has been in existence a little over four years and has resulted in much benefit to the local rubber manufacturers, all of which are members. The roster of the association includes the Acme Rubber Manufacturing Co., Ajax Rubber Co., Inc., Bergougnan Rubber Corp., Essex Rubber Co., Empire

ANNUAL MEETING AND BANQUET OF THE TRENTON RUBBER MANUFACTURERS' ASSOCIATION AT THE TRENTON COUNTRY CLUB.

Rubber & Tire Co., Globe Rubber Tire Co., Hamilton Rubber Manufacturing Co., Home Rubber Co., Crescent Insulated Wire & Cable Co., Luzerne Rubber Co., Semple Rubber Co., Joseph Stokes Rubber Co., Thermoid Rubber Co., United & Globe Rubber Co., Whitehead Bros. Rubber Co., Mercer Rubber Co., all of Trenton, and the Vulcanized Rubber Co., Morrisville, Pennsylvania; Quaker City Rubber Co., Philadelphia, Pennsylvania; Electric Hose & Rubber Co., Wilmington, Delaware.

Meetings are held every two months except during the summer period. Matters of particular as well as general interest are discussed at these meetings, and the friendly intercourse arising has been of much benefit in many ways to the members. The labor turn-over was one of the first matters given attention, and after a short time this feature of economic waste was very much reduced.

The bi-monthly meetings are always held in the evening, when those present partake of the famous cuisine of the Trenton Country Club.

The annual meeting held December 8, and names of officers elected at that time were recorded in THE INDIA RUBBER WORLD January 1, 1920.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE FIRST MONTH of the new year found the manufacturers of rubber goods in Rhode Island ready for a continuance of the season of great prosperity that has been unprecedented for the past four years. Everything is favorable to the year 1920, exceeding any previous twelve months in the history of the industry. Orders on hand are sufficient to justify this prophecy, but the labor situation continues to cause the manufacturers of rubber goods, in common with practically all other lines, considerable worry. Practically every plant in the State is looking for, but only in comparatively few cases, is finding, experienced help. And this, notwithstanding the substantial increases that have recently been made in the wage schedules.

The Atlantic Tubing Co., of Knightsville, is giving free life insurance to all its employees who have been with the concern six months or more. The initial amount of insurance issued to any employee is \$500, and this amount increases each year by \$250 until a maximum of \$1,000 is reached. A blanket policy covers all the lives, and each person insured is presented with a certificate. He names his beneficiary in the same manner as he would under an ordinary policy, and has the privilege of changing the beneficiary as circumstances demand. No medical examination is required.

One of the largest and most important mill plant purchases that have occurred in this state in many months was consummated recently when the plant of the Greene & Daniels Co. of Pawtucket was transferred to the Ninigret Mills Co. of Boston, the majority stock of which is owned by The Fisk Rubber Co., of Chicopee Falls, Massachusetts. This concern is a newly formed Massachusetts corporation, with a capital stock of \$3,000,000, divided into \$2,500,000 preferred and \$500,000 common stock. J. A. Brander, of Brander & Curry, Inc., New York city, is president; Charles F. Broughton, treasurer of the Wamsutta Mills, New Bedford, Massachusetts, vice-president; H. T. Fisk, of The Fisk Rubber Co., treasurer; Henry Otte, first assistant treasurer; Charles S. Fowler, second assistant treasurer; Arthur Houghton, secretary, and John E. Searle, clerk.

The company will operate two plants for the manufacture of automobile tire yarns and fabrics, one being located at Pawtucket and the other at Westerly. The Ninigret Mills, at Westerly, which will be operated under the direction of Mr. Fowler, are already equipped with twisting, spooling and weaving machinery, but 20,000 spindles are to be added at an expense approximating \$1,000,000 and a new building, to cost \$500,000, is to be erected which will afford facilities for the employment of some 700 persons. This plant will have an annual capacity of 250,000,000 pounds of tire fabrics, and will carry an annual payroll of nearly \$1,000,000.

The Greene & Daniels plant is located on Central street, and employs about 600 textile workers. It will be under the direction of Mr. Otte, and is to be thoroughly overhauled and arranged for the production of tire yarns and fabrics.

January was a busy month at the plant of the National India Rubber Co., Bristol, because of numerous conferences of the committees on industrial relations and employees' welfare; conferences of sales forces and department heads, and other activities, together with material improvements of the plant, and the unusual business activities.

At a conference of the committees on industrial relations of the rubber factories controlled by the United States Rubber Co., held at the National factory, there were inspections and comparisons of plans. The physicians, dentists, and nurses of the factories also held a convention the same day at the DeWolf Inn at Bristol, when papers were read by several, including Dr. M. J. O'Brien, dentist at the Bristol plant, who spoke on "Industrial Dentistry."

In line with other improvements in the welfare work at the National factory, the circulating library, which the company has maintained for the benefit of its employees for a long time, is to be materially enlarged, the demands upon its facilities having increased to a considerable extent in the last few months.

A powerful pump for use in bringing salt water from Bristol harbor to the National factory has been set in place at the pumping station on Thames street, greatly increasing the factory water supply.

Mrs. Augusta Mapes, who was employed at the National factory for more than 40 years as overseer in the clothing and other departments, previous to some ten years ago, died at the Home for Aged Women in Bristol on January 11, in her 87th year.

The Revere Rubber Co. continues to extend and improve its plant on Valley and Hemlock streets, Providence, and has recently purchased several additional tracts of land, so that the holdings of this concern have increased considerably during the past year. The company is now erecting for storage purposes a three-story fireproof building of steel, brick and concrete on Hemlock street. It is 120 feet by 110 feet, and work is being pushed as rapidly as possible. The company is also building an addition to one of its two-story factory buildings on Eagle street.

The Kokomo Tire Co., a corporation to deal in motor cars, tires and accessories, in Providence, with a capital stock of \$10,000, has been granted a charter under the laws of Rhode Island. The incorporators are Maurice Robinson, David C. Adelman and Charles M. Robinson.

The National Rubber Co., 36 Franklin street, Providence, has been purchased by Amedeo Morville and Carlo Morville, who will continue the business.

Ludger Goyer and Gustave Grandine have filed their statement with the city clerk of Central Falls, that they are the owners of the Reliable Vulcanizing & Tire Co., 575 Dexter street, that city.

The firm of Albert Bliss & Co., has been incorporated under the laws of Rhode Island, and organized as the Bliss Rubber Co., and will continue business at 130 Empire street, Providence. Albert Bliss is president and general manager, and the firm will handle Racine tires.

The Columbia Narrow Fabric Co., manufacturers of elastic webbing at Shannock, is planning an addition to increase the plant's operations. The concern recently negotiated for the purchase of the Carmichael Mill property at Shannock.

Three new mills are to be added to the plant of the Tubular Woven Fabric Co., Pawtucket, to adjoin the present property at Main and Carver street and to extend to the Pawtucket river. One of the structures will be of brick, four stories high, 58 by 183 feet, and the other two buildings will be one story high, 99 by 37 feet, and 60 by 105 feet, respectively. The estimated cost of the new buildings will be \$200,000.

The New England Elastic Braid Co., 18 Broadway, Pawtucket, is owned by Mrs. Agnes Coucher of that city, according to her statement filed at the city clerk's office.

W. Maxwell Reed, for the past year and a half plant manager of the American Winger Co., at Woonsocket, has resigned. John

F. Sweeney, assistant plant manager and sales agent, will fill the position temporarily.

The Broadway Tire Exchange, 107 Broadway, Providence, has changed the firm name to Millers, Inc., the new officers being David Miller, president; Bernard H. Miller, treasurer and general manager; Henry J. Miller, vice-president, and Samuel Miller, secretary. Charles E. Angell and Angelo Uranoli, formerly of the Broadway Tire Co., Providence, have taken over the vulcanizing department and have opened a shop at 50 Broadway.

Trial of the suit of the I. T. S. Rubber Co., of Elyria, Ohio, against the United Lace & Braid Manufacturing Co., of Providence, in which the plaintiff alleges infringement of a patent on a rubber heel, was heard in the United States District Court before Judge Arthur L. Brown early in the month. The plaintiff asked that the court grant a permanent injunction, restraining the defendant from the further use of the heels in controversy, and also for an accounting and settlement from the defendant company of the sales of rubber heels which the plaintiff declares are an infringement on their patent rights. The case was taken under advisement.

THE RUBBER TRADE IN MASSACHUSETTS.

By a Special Correspondent.

THE NINTH ANNUAL CONVENTION of the National Shoe Retailers' Association, held in Mechanics' Building, Boston, January 12, 13, 14 and 15, proved to be a triumph, exceeding in attendance, number of exhibitors and of important addresses all previous gatherings of the association. Some 6,000 buyers from all parts of the country overtaxed the capacity of the city's hotels.

At the various business sessions many timely talks were given by leaders in the industry, some with motion picture, the subjects treated including general business and market conditions, style and price tendencies, manufacturing and sales problems, etc.

Interested centered, however, in the manufacturers' exhibits in Paul Revere Hall, where the rubber industry was well represented by the following firms displaying rubbers, rubber boots and over-shoes, rubber and fabric shoes, rubber heels and fiber soles and machinery: Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut; Cambridge Rubber Co., Cambridge, Massachusetts; Firestone Tire & Rubber Co., Akron, Ohio; United Shoe Machinery Co., Boston, Massachusetts; Foster Rubber Co., Boston, Massachusetts; The B. F. Goodrich Co., Akron, Ohio; The Goodyear Tire & Rubber Co., Akron, Ohio; Hood Rubber Co., Watertown, Massachusetts; Plymouth Rubber Co., Canton, Massachusetts; United Lace & Braid Manufacturing Co., Providence, Rhode Island.

Two miniature rubber shoe factories operated in the basement of Mechanics' Building by the United States Rubber Co. attracted much attention. Expert shoemakers demonstrated how rubber shoes and white canvas fiber-soled shoes are made, starting with the crude rubber and going right through to the finished product.

The second evening, the Style Show, one of the most popular features of past conventions, was repeated in elaborated form. Beautiful young women, appropriately costumed, paraded along the broad, elevated "Chemin des Dames" and other war-named avenues, and mingled with the crowd displaying the newest styles in all sorts of footwear. To show the latest dictum in rubber and fabric sport shoes, there were bathing girls, tennis girls, golfing girls and basket-ball girls. Children's and men's canvas footwear were also shown.

The convention came to a close Thursday evening with a banquet in Convention Hall, at which Governor Calvin Coolidge and Senator David I. Walsh, of Massachusetts, were the principal speakers. The next national footwear convention will be held at Milwaukee, Wisconsin.

Some 800 foremen in the footwear division of the United States

Rubber Co. held their second annual convention in Boston, December 29 and 30, for the purpose of discussing technical and production problems of the industry with the aim of standardizing methods of operation in the various factories.

The supervisory forces of 17 different footwear factories operated by the company in Cambridge, Malden, Melrose, Stoughton and Millville, Massachusetts; Bristol and Woonsocket, Rhode Island; New Haven, Naugatuck, Waterbury and Milford, Connecticut; New Brunswick, New Jersey; Williamsport, Pennsylvania; St. Louis, Missouri; and Hastings, Michigan, were represented.

The convention opened with a general session in Ford Hall at which Myron H. Clark, general factory manager of the footwear division, presided. Homer E. Sawyer, vice-president of the company, spoke on industrial relations; C. R. Haynes discussed technical factory problems; George L. Lawrence, production factory manager, touched upon the problems of quantity production; C. T. McCarthy, general manager of the Naugatuck factory, outlined the use of charts and statistics in factory administration, and A. T. Hopkins, service manager, led a discussion on industrial relations.

During the afternoon and the next day the convention was divided into departmental groups for luncheon in the various hotels and discussion of common problems. The first evening a smoker and entertainment was given in Ford Hall, at which the National India Rubber Co. Band, of Bristol, Rhode Island, played under the direction of F. E. Essex. The convention came to a close the second evening with a reception and banquet given to the officials of the company at the Copley-Plaza Hotel, the guests including Charles B. Seger, president; Homer E. Sawyer, vice-president; Myron H. Clark, general footwear factory manager; George H. Mayo, general manager of sales, and C. W. Barnes, general sales agent. Topical songs were rendered by the various factory groups, each under the direction of a cheer leader. Spare moments during the two days were devoted to sightseeing trips to points of interest about the city.

Realizing that a knowledge of English means better opportunities and more comforts of life to the immigrant, the Hood Rubber Co. plans to make a wide-spread campaign in Americanization work. Census cards have been given to the foremen in each department. Every foreigner is being interviewed personally. Teachers from Cambridge and Watertown have been secured; class-rooms in different parts of the plant have been arranged; books and equipment purchased; meetings with motion picture films, and classes conducted by Mr. Mahoney in charge of the State Americanization Work and George Quinby, of the Associated Industries of Massachusetts, are being held in the restaurant. The classes chosen for this work are made up of men and women chosen from different parts of the plant, and the intelligence and interest shown by them only too conclusively proves that there is a boundless field for this work, and an infinite amount of good can be done for the people of foreign birth who have become a part of the community.

The Mulconroy Co., Philadelphia, Pennsylvania, manufacturer of metallic hose, etc., opened, on January 1, a branch store at 85 Purchase street, Boston, Massachusetts, through which to handle the New England trade.

At the recent annual meeting of Aleppo Temple, Ancient and Accepted Order of Nobles of the Mystic Shrine, Francis H. Appleton, of F. H. Appleton & Son, Inc., reclaimers, and Joseph H. Work, dealer in last- for rubber shoes, were elected respectively assistant rabban and treasurer. Both have long been prominently identified with various Masonic bodies in Boston.

Dr. Robert S. Quinby, service manager of the Hood Rubber Co., Watertown, has been elected president of the Employment Managers' Association, an organization composed of an exten-

sive membership of men selected from New England industries to make a detailed investigation of better employment relations.

The various organizations headed by George N. Tougas have taken the entire second floor at 161 Summer street, Boston, for headquarters and main sales offices. The Tougas organizations include the Tougas Shoe Co., Boston, shoe jobbers; the Salem Die Co., Salem, die manufacturers; George N. Tougas, Boston, shoe and rubber manufacturers' supplies. Mr. Tougas is also a director of the Brockton Trust Co., Brockton, Massachusetts.

GEORGE N. TOUGAS

The demand for Killion cushion heels is such that the Killion Rubber Co., Dorchester, will discontinue its mechanical and all other lines and continue its efforts to heels alone. Various alterations have been made in the plant, a new mixer, presses and other equipment have been installed, and the company will soon be in a position to double its present production.

Owing to the death of L. L. Cheney, Boston, salesman for the Clifton Manufacturing Co., manufacturers of clothing, carriage cloth and proofed fabrics, at Jamaica Plain, the firm will temporarily be represented in this territory by I. M. Post and T. Frank McCarthy, its New York City salesman.

Frank A. Vanderlip, a director of the United States Rubber Co., and one time assistant secretary of the treasury, in a recent address before the Old South Meeting House Forum, attributed chiefly to the excessive issue of paper money by the United States and other countries during the war the present high prices and declined purchasing power of the dollar. He urged "spiritual regeneration" as the remedy and asserted the need to defeat by self-denial, although it would test the character of the nation to accomplish it.

With the organization of the Tyrian Service Association by employees of the Tyer Rubber Co., Andover, there begins another interesting experiment in industrial relations. The preamble to the constitution sets forth the belief that employers and employees have common interests, and that all problems can be solved and permanent prosperity assured by this considerate and earnest cooperation. The employees therefore undertake by frank discussion and earnest effort to solve the problems confronting the Tyer Rubber Co. and themselves in order to promote their common welfare and to advocate sound Americanism in such a way as to serve the community, commonwealth and nation.

The business of the association is to be transacted by a committee of twenty-five persons representing the various departments by allotment according to the number of operatives in each. Eight may be elected by the management, eight by the foremen's committee and the balance are to be elected by and from the employee membership. Monthly meetings are to be held, and the committee will serve as the channel of communication between the employees and the company, making such suggestions or recommendations as are deemed advisable. The following matters are regarded as within the scope of discussion by the committee: General welfare of the employees and the company; methods and equipment; output and cost; working hours; wages and economy; misunderstanding between the company and the employees; suggestions.

A recent survey of the operatives of the plant gave the following result regarding citizenship: Number of citizens, 812

per cent; number holding first place, 10.2 per cent; number of aliens, 8.6 per cent. Nearly all are of English speaking stock.

The Athol Manufacturing Co., Athol, Massachusetts, manufacturer of pneumatic rubber goods, announces that a new company will soon be formed to conduct the business of its Metropolitan Air Goods Department. Richard A. Whall, formerly secretary and treasurer of the Metropolitan Air Goods Co., originally at Reading, Massachusetts, is air goods manager of the Athol Manufacturing Co., and many new articles of his design have been placed on the market.

The Taunton Rubber Co., Taunton, reports that its 1919 business, notably in "Peerless" heels, was double that of 1918. A new high grade heel under the brand "Columbia" will soon be placed on the market. Three salesmen are introducing these goods to the trade, namely, W. Gomberg, Frederick Eppler and Harry Crossman. The officers of the company remain as in the past, William L. Gifford, president; Joseph L. Gifford, treasurer.

Several hundred delegates from the National Shoe Retailers' Association convention in Boston were entertained at a luncheon given by M. M. Converse, president of the Converse Rubber Shoe Co., Malden, at the factory restaurant on January 13. They were afterward shown through the plant and displayed much interest in the processes of rubber shoe manufacture.

The new five-story storage addition to the south end of the shipping room is nearly completed. The four-story addition to the north end of the building is also well along. The first floor will enlarge the mill room for Converse tires, while the floors above will be occupied by the receiving department, its former quarters providing needed expansion in the shoe factory.

An oil burning system is being installed at the plant of F. H. Appleton & Son, Inc., at Franklin, Massachusetts, to overcome the coal shortage.

REORGANIZATION OF THE BOSTON BELTING CO.

W. E. Hardy, F. H. Rice, H. H. Whitesel and associates, who have been operating the Boston Belting Corp., so far as production and sales are concerned, have purchased and taken over all assets of the corporation which relate to the mechanical rubber goods business. The Boston Belting Co., whose major assets had been transferred to the Boston Belting Corp. some two years ago, had never been dissolved. Consequently, on November 6, when Thomas A. Forsyth and J. H. D. Smith resigned as directors and as president and treasurer, respectively, their positions were filled by the election of W. E. Hardy, president and general manager; F. H. Rice, treasurer, and H. H. Whitesel, director and sales manager. Therefore, the business is continued without break, inasmuch as the new officers had operated the company for two years prior to its sale, under the management of Mr. Forsyth.

The Boston Belting Co., incorporated under the laws of the State of Massachusetts, was originally established in 1828, incorporated by State Legislative Grant in 1845 as the Good-year Manufacturing Co., the firm name being changed in 1847 to Boston Belting Co. The present capitalization is \$1,015,000; \$515,000 preferred issue; \$500,000 common. All stock has been issued. Over one-third of all employees are shareholders.

H. H. Whitesel, who grew up in the mining fields of Colorado and Missouri, was engaged in the supply business at Joplin, Missouri, some fifteen years ago. He became identified with the Diamond Rubber Co. in 1908, as field salesman, later becoming St. Louis branch manager and then general mining representative, continuing with the Diamond Rubber Co. until 1915, he then took up the western sales of the Boston Belting Co. and in January, 1918, became general sales manager.

F. H. Rice was an Ohio farmer boy. After spending six years in the machine tool department of the Warner & Swasey

Co. of Cleveland, Ohio, specializing in cost accounting, he became identified with the treasury and accounting departments of the Diamond Rubber Co. in 1908, continuing in this position for four years, then joining the organization of the Firestone Tire & Rubber Co. for three years. In 1915 he became assistant treasurer of the Boston Belting Co.

W. E. Hardy, upon his graduation from Buchtel College—now Akron University—spent a few years mining in Arizona and Old Mexico. After a year with the Brown Hoisting Machine Co., of Cleveland, Ohio, he got a "job" operating a belt press with the Diamond Rubber Co. at Akron, Ohio, in 1903, later becoming successively assistant sales manager, New York manager of mechanical sales and general mechanical sales manager at Akron. He joined the Boston Belting Co. organization in 1915.

PORTAGE WORKS MANAGER.

JOHN T. JOHNSON, works manager of The Portage Rubber Co., of Akron, Ohio, is working out production plans that entail the building of a large new unit to the Portage factory at Barberton, Ohio, to be devoted almost exclusively to the production of cord tires. Work will be started soon on the new structure which is to comprise a header building with three wings, each of which will be 200 by 60 feet and several stories in height.

JOHN T. JOHNSON.

Mr. Johnson is a graduate of the mechanical engineering college of Cornell University, was for many years with The B. F. Goodrich Co. at Akron. Starting in the cord tire department, he became manager of that department and later was placed in charge of the Goodrich tire experimental department. For a short time he was works manager of the Cord Tire Corp. at Chester, West Virginia, leaving that position to come to the Portage company. He is a keen student of industrial relations and an enthusiastic supporter of athletics for both men and women.

MCGRAW'S BALTIMORE BRANCH MANAGER.

L. L. McANANEY, who has been appointed manager of the Baltimore branch of The McGraw Tire & Rubber Company, Cleveland, Ohio, is one of the best known tire men in the country, having been identified with the industry for the past seventeen years.

Mr. McAnaney's position in the tire business is an enviable one, as he by no means started at the top of the ladder. Starting as a stenographer in the factory of The B. F. Goodrich Co. at Akron, Ohio, he was next made a salesman, working the territory around Boston for the Goodrich company. The marked ability of Mr. McAnaney soon won for him another promotion—that of manager of the Goodrich company's Cleveland branch. In Cleveland he was a big success and became one of the

L. L. McANANEY.

most popular tire men in Ohio. For over nine years he managed the Goodrich branch, while for over four years previous to his connection with the McGraw company he served as manager for the Republic Rubber Co., Youngstown, Ohio.

Mr. McAnaney's pleasing personality, his energy, and his ability as a tire expert, are certain to win for him and the McGraw company a host of new friends in the Baltimore territory.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

AKRON NOTES.

THE B. F. GOODRICH Co. and The Goodyear Tire & Rubber Co. have taken out permits for additions to their plants in Akron to cost nearly \$3,000,000. The permit issued to the Goodrich company was for an \$800,000 addition, which was followed a few days later by another one calling for the expenditure of \$1,400,000.

These permits, company officials state, do not represent the actual expenditure for the buildings to be erected, since they are based upon cost of construction to-day, and it is well known that the cost of all building materials and labor will have advanced a great deal before the work is completed a year hence.

The great question in the minds of the factory managers of both of these companies is where they can house the men to man these plants.

The Portage Rubber Co. recently decided to issue another \$1,000,000 worth of capital stock to stockholders. Persons holding five shares of common stock are privileged to purchase one share of the new issue. The capitalization of the company is not to be increased, only \$2,500,000 worth of common and \$1,300,000 of preferred stock having been issued of the original \$10,000,000 authorized. The business of the company has doubled during the past few months.

Akron's \$1,000,000 automobile show, held in the largest garage in the world, was a success. The attendance during the week of the show was approximately 35,000. Plans are being made for an even greater show next year.

The Philadelphia Rubber Works Co., Akron, has made arrangements for the construction of a \$17,000 addition to its plant. Work will commence on the addition in the very near future. A building permit for the structure has been obtained from the city building department.

Promotions for several sales executives were among the New Year changes in personnel announced by the Firestone Tire & Rubber Co., Akron.

E. W. BeSaw, who has been western sales manager for three years, with headquarters in Akron, becomes the general sales manager, succeeding A. G. Partridge, who was recently made vice-president in charge of sales.

F. K. Starbird, who has been a district sales manager, with headquarters in Minneapolis, succeeds Mr. BeSaw as western sales manager.

L. G. Fairbank, who has been eastern sales manager, with headquarters in Akron, becomes vice-president and general manager of Firestone Steel Products Co.

Paul P. Sheeks, graduate of South Dakota University, and an all-around athlete, has been appointed coach and athletic director of the Firestone Tire & Rubber Co., Akron.

At a special meeting of the stockholders of the Amazon Rubber Co., Akron, steps were taken to increase the capitalization of the company from \$400,000 to \$1,500,000.

The Miller Rubber Co., Akron, according to F. C. Millhoff, its general sales manager, enjoyed during 1919 the biggest tire year in its history, from the standpoint of production and sales, the increase over the sales of the previous year amounting to approximately 50 per cent.

The coal strike was met by The General Tire & Rubber Co., Akron, by the purchase of an option on a mine of 30 tons, daily capacity for 30 days and asking for volunteers from the employees of the company to mine the coal. Fifty men immediately responded, of whom eight were experienced miners. Trucks were used by the company to carry the coal to the plant.

The business of The General Tire & Rubber Co. amounted to \$5,000,000 during the past year, it was announced at the annual meeting of the stockholders of the company recently. This amount is 95 per cent greater than the business during the previous year. The officers of the company who served during the past year were reelected.

The new clubhouse of The Goodyear Tire & Rubber Co., situated near the company plant, will be ready for occupancy about February 1. An appropriate program for the opening is being arranged by the company. The building is probably one of the most pretentious ever erected for welfare work in this country. It is seven stories high and will tower above the surrounding Goodyear buildings. It will contain a gymnasium, a theatre to accommodate 2,000 persons, a swimming pool, a reading room, a library, music rooms, a cafeteria and a film manufacturing department.

One of the floors will be devoted to the Goodyear University, which will be established in the near future. Plans for this educational institution have not yet been completed, but it is believed in well informed circles that instruction will be given which will make it possible for an employee to obtain a degree equivalent to that of doctor of philosophy in the ordinary university.

The H. B. Bixler Co., headed by H. B. Bixler, a consulting engineer with offices in the Ohio Building, Akron, has announced plans for a laboratory and manufacturing testing plant which will sell its services to the smaller rubber companies in the United States. Mr. Bixler's plans include a factory where rubber goods will be manufactured on a small but absolutely commercial scale. The plant which is to be built in Akron during the first months of the new year will cost approximately \$600,000.

At the recent directors' meeting of The Williams Foundry & Machine Co., Akron, F. E. Holcomb was reelected president and general manager of the company. Mr. Holcomb was elected president of the concern in 1918, succeeding J. K. Williams in

that office. He was formerly manager of the Akron plant of the Kelly-Springfield Tire Co.

The other officers of the company are: S. E. Zilio, vice-president; G. C. Dietz, treasurer, and W. J. Slater, secretary and assistant treasurer; directors, Charles Herberich, Aaron Burnett, and Charles Reymann.

The Williams Foundry & Machine Co. manufactures tire repair equipment in addition to building machinery and appliances for tire and rubber plants. Its development has been steady and consistent and the treasurer's report for the year just ended states that the business for the preceding fiscal year amounted to more than \$2,000,000.

F. E. HOLCOMB.

The Portage Rubber Co., Akron and Barberton, Ohio, at the annual meeting of its directors held on January 13, 1920, reelected the following officers: M. S. Long, president; James Christy, chairman of board of directors; J. W. Maguire, vice-president and general manager. The newly elected officers are: H. M. Kerr, secretary; W. E. Wilson, treasurer; and R. J. Cole, assistant treasurer. Mr. Kerr will also act as controller.

Ground is being broken for a large addition to the Portage Company's plant, to take care of increasing business, and it is expected that the new addition will double the present capacity.

The B. & W. Rubber Co., Akron, has completed its main building, 60 by 240 feet, two stories in height. The machinery for the mechanical department is installed and in operation and that for the tire department is being installed. It is hoped that the tire department will be in operation by April 1, with a daily production of 150 tires. H. A. Backderf is president of the company.

CLEVELAND NOTES.

The Cleveland Osborn Manufacturing Co., Cleveland, Ohio, has changed its name to The Osborn Manufacturing Co., Inc.

The Tyler-Patterson Co., 404 Superior Building, Cleveland, Ohio, has been formed by Edgar J. Tyler, until recently vice-president and director of Ralph L. Fuller & Co., Inc., and C. B. Patterson, formerly in charge of the rubber materials division of the Fuller company. The new concern will act as manufacturers' agents, brokers and dealers in raw materials for the rubber industry and others.

The Uncle Sam Tire Co. has changed its name to The Hubbell Tire & Rubber Co., with offices at 6545 Carnegie avenue, Cleveland, Ohio. It manufactures tires and tire machinery and will install equipment for the manufacture of its own patented tire molds and vulcanizers. The authorized capital has been increased from \$200,000 to \$1,200,000.

MISCELLANEOUS OHIO NOTES.

The Mason Tire & Rubber Co., Kent, Ohio, at its annual stockholders' meeting, elected the following directors for the fiscal year 1920: O. M. Mason, John H. Diehl, R. M. MacKinnon, D. M. Mason, E. G. Tillotson and W. R. Green. These in turn, at the first directors' meeting, elected the following officers: O. M. Mason, president; John H. Diehl, first vice-president; R. M. MacKinnon, second vice-president; D. M. Mason, treasurer, and William A. Cluff, secretary. W. J. Rennick and H. W. Sidnell were also appointed assistant treasurer and assistant secretary, respectively.

The Marion Tire & Rubber Co., Marion, Ohio, was reorganized at the beginning of 1920, and its capital increased to \$750,000. The new officers are nearly all Akron men. The president is A. F. Ayers; vice-president, W. E. Cameron; secretary, G. W. McLaughlin; treasurer, S. F. Zilliox. The other directors are R. C. Ellsworth and W. A. Patterson, of Akron; C. W. Mapes, J. W. Jacoby and R. D. Belden, of Marion, and W. H. Holreistott, of New York. W. A. Patterson was made factory manager. The capacity of the Marion plant at present is 1,500 tubes and 400 tires per day, but it is planned to double this production as soon as possible.

The Ashland Tire & Rubber Co., Ashland, Ohio, expects to complete the first unit of its factory in February. It is 225 feet long and 100 wide, with 45,000 square feet of floor space, and is built of reinforced concrete. The main building, power house, and two smaller buildings will cost approximately \$150,000. The machinery has been ordered and a two months' supply of crude rubber purchased. The company will manufacture cord and fabric tires.

Export arrangements have been made with A. Metzner, of Cleveland, whereby George W. Bond will represent the Ashland company on his present trip abroad. He will visit England, Czechoslovakia, Germany and Austria, and other Central European nations.

The Ashland Tire & Rubber Co. was incorporated in June, 1919, with \$500,000 capital stock, of which it has sold more than \$350,000 to date. The officers of the company are: J. Fickel, president; G. C. Weyher, vice-president, and A. A. Fickel, secretary and treasurer. The president and H. C. Bate, one of the directors, left in January on a three weeks' business trip to Cuba to make a careful study of that market for automobile and truck tires.

The India Tire & Rubber Co., Mogadore, Ohio, has just completed the new building south of its initial structure, besides improving the older building. At the annual meeting on January 19, stockholders were asked to ratify an increase in the capital stock from \$1,500,000 to \$5,000,000, this increase having been acted on favorably by the board of directors to take care of increasing business.

Plans for increasing the capital of the Interlocking Cord Tire & Belt Co., of Mogadore, was decided upon at a stockholders' meeting, held recently, but no definite announcement has been made as to the amount. The company is made up of 125 Akron business men. For the past year it has manufactured 30 by 3 tires, but arrangements are now being made to include other sizes. The purpose of the new capital is said to be to bring the capacity of the factory to 1,000 tires per day.

The McGraw Tire & Rubber Co. at the annual meeting of stockholders held at East Palestine, Ohio, on January 12, 1920, elected officers for the ensuing year: E. C. McGraw, president; John Morgan and R. W. McGraw, vice-presidents; John Morgan, treasurer; L. M. Kyes, secretary; H. C. Johnston, assistant secretary. Directors: E. C. McGraw, John Morgan, R. W. McGraw, L. M. Kyes, George Flaccus, J. C. Chamberlin, S. L. McCune, William Leary, A. W. Henn and H. M. Bacon.

During 1919 the business each month showed substantial increases over the previous year's record. In 1920 new branches will be added to the fourteen already established. The officers deny emphatically the rumors of the sale or merger of the company.

F. E. Kaepfel, recently associated with the Mechanical Rubber Co., Chicago, Illinois, and formerly with the Federal Rubber Co., Cudahy, Wisconsin, has been appointed general sales manager of the newly organized Ohio State Rubber Tire Co., Port Clinton, Ohio, which builds tires and tubes for the jobbing trade exclusively. Mr. Kaepfel will have sole charge of the company's sales throughout the United States.

TRAILERS TO CUT THE COST OF MOTOR HAULAGE.

More than half a billion dollars a year is being spent unnecessarily in the United States for road haulage by motor truck. Some 600,000 trucks throughout the country are rendering an annual service of about 7,950,000,000 ton miles at a cost not far from \$1,828,500,000. This is based on an average operating cost of 23 cents per ton-mile.

Tables of operating costs of trailers and semi-trailers show the cost to vary from about three and one-half cents to six and one-half cents per ton-mile, according to type and size of trailer. This indicates five cents as an average, but to be conservative, an average of ten cents per ton-mile is taken as the basic cost of haulage with trailers and semi-trailers.

If every motor truck were to draw one trailer or semi-trailer of the same load capacity as the truck, half the total tonnage would be carried on the trailers at a saving of 13 cents per ton-mile or a total of \$516,750,000 annually in the nation's motor haulage bill. This is the solution if the cost of motor haulage at distances greater than fifty miles is to be reduced materially and put on a competitive basis.

Incidentally 600,000 trailers would call for 1,200,000 to 2,400,000 tires for original equipment and from 300,000 to 600,000 spare tires besides.

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" AND "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

THE PERFECTION TIRE & RUBBER CO.

ONE of the pleasantest experiences of a recent Western trip was a visit of a representative of THE INDIA RUBBER WORLD to the plant of The Perfection Tire & Rubber Co., at Fort Madison Iowa, one of the most progressive rubber manufacturing concerns in the Middle West. This plant, comprising 340 acres of land, is most favorably located on the main lines of the C. B. & Q. and Santa Fe railroads and is an attractive example of rubber mill architecture. The factory buildings are of fire-proof construction, with dimensions of 350 by 180 feet, affording a floor space of 26,000 square feet. They are equipped with automatic sprinklers and fire doors throughout and the arrangement of the various departments constitute a most ingenious plan to economize effort and avert lost motion. Separate from these buildings are a well equipped tool house and one devoted to spreader work.

A large number of substantial and attractive dwellings, costing from \$5,500 to \$8,000, have been erected for the factory executives and are now being occupied by them. An imposing brick structure, now being built, on the main street, in front of the factory, will serve as a club for the entertainment of visitors. Each room will have a bath attached and dining and entertainment facilities will be provided for the guests of the company.

The mill and calender rooms, building and vulcanizing departments are equipped with the most modern types of machinery and devices known to rubber manufacturing usage. The laboratory in charge of a competent chemist, is fitted with the latest and most approved appliances. The power plant is in consonance with the general character of the mill, and leaves little to be desired in point of complete and up-to-date equipment. The power itself is derived from the Keokuk Dam said to be the largest in the country and yielding power at \$0.007 per kilowatt. The present output of 700 tires and 500 tubes a day will be increased to meet the growing demand for these products. The company has on hand sufficient material, including chemicals, crude rubber, and fabric to meet its requirements until next September.

The products of The Perfection Tire & Rubber Co., include an asbestos protected tire of unique, patented structure, for which is claimed unusual durability and inexpensive mileage. Another, is a cord tire built on the Dickinson cord tire machine controlled by the company, and is expected to prove an important factor in tire production. The third is a ribbed or plain tread fabric tire which has elicited favorable comment and a good demand. Perfection gray and red inner tubes and inner linings are of construction and quality commensurate with general "Perfection" standards. The favorable labor conditions in this section are reflected in the fact that the 600 employees of the company are 100 per cent American.

The president and general manager of the company, Preston E. Roberts, who is admittedly responsible for the development and present status of The Perfection Tire & Rubber Co., is a man of unusual capacity, versatile and resourceful in a marked, unusual degree. The other officers are R. J. Evans, vice-president and F. J. Keating, secretary and treasurer. The board of directors comprise Rufus F. Robinson, Chicago, Illinois; Preston

E. Roberts, Fort Madison, Iowa; F. J. Keating, Peoria, Illinois; J. F. Figley, Canton, Ohio; Edwin Telman, Peoria, Illinois. R. J. Evans, Wabash, Indiana; H. M. Scambler, Chicago, Illinois.

The general superintendent, William T. Whitlock, was formerly with the G. & J. Tire & Rubber Co. and The Fisk Rubber Co., and is an expert in modern tire production. He is ably assisted by Curtis L. Moody.

The Wabash, Indiana, division of The Perfection Tire & Rubber Co., is devoted to the manufacture of mechanical goods and asbestos fabrics. It comprises 100,000 square feet of floor space and it is stated that the output of this division is contracted on a cash in advance basis. The products are filter cloth, plain cloth, wire inserted cloth, yarns, mantle yarn, tape and listing, braided tubing, braided cord, twisted cord rope packing, wick packing, mill board, carded fibre and a general line of mechanical and molded specialties including plumbers' supplies, braided flax packing and shoe soles and heels.

An arrangement covering a period of twenty years has been made by The Perfection Tire and Rubber Co., with the Nemours Trading Corp., who have undertaken the entire distribution of "Perfection" products.

PLANT OF THE PERFECTION TIRE & RUBBER CO., FORT MADISON, IOWA.

MID-WESTERN NOTES.

By a Special Correspondent.

AT THE ANNUAL MEETING of the directors of the Mid-West Rubber Manufacturers' Association, held in Chicago January 15, the

following officers were elected for the ensuing year:

John T. Christie, president; Hawkeye Tire & Rubber Co., Des Moines, Iowa; C. Wright, vice-president; Racine Auto Tire Co., Racine, Wisconsin; W. W. Wuchter, secretary; Nebraska Tire & Rubber Co., Omaha, Nebraska; George B. Dryden, treasurer, Dryden Rubber Co., Chicago, Illinois.

At the annual meeting of the Nebraska Tire & Rubber Co., held at Omaha, Nebraska, January 5, a resolution was unanimously adopted changing the capital stock of the company to \$200,000 preferred stock and \$300,000 common stock, and authorizing the officers to offer for sale \$100,000 of the new common stock. The following were reelected to the board of directors for the coming year: James E. Cornish, V. E. Holm, S. C. Wolfe, George W. Masson, G. C. Peironnet, Alva Smith and W. W. Wuchter. The board of directors later reelected the following officers for the year: Alva Smith, president; G. C. Peironnet, vice-president; F. M. Holloway, secretary; W. W. Wuchter, general manager and treasurer.

With the commencement of the new year and its new addition complete and machinery installed, the Wilson Tire & Rubber Co., Springfield, Illinois, has changed the policy of the company from making the "Wearwell" tires to making a fabric tire of Egyptian fabric guaranteed for 6,000 miles. It has also part of its new cord equipment in and is building cord tires which will be guaranteed for 8,000 miles. The factory output will be approximately 800 tires per day by the end of February.

The Brunswick-Balke-Collender Co., Chicago, Illinois, manufactures billiard tables, phonographs, phonograph records, automobile tires and hard rubber goods, and the output is largely oversold in all departments. Five new factories for the manu-

facture of the Brunswick phonographs and phonograph records were purchased in different cities during 1919, and ground will be broken in the early spring for a large addition to the tire manufacturing plant at Muskegon, giving a capacity of 5,000 tires per day. Sales for 1919 were \$25,000,000 as against \$12,416,000 in 1918. Estimates based on sales during January, 1920, put the total sales for the current year at \$45,000,000 exclusive of the sales of the two lumber mills which the company owns in upper Michigan.

The Standard Four Tire Co., Keokuk, Iowa, held its annual sales convention, January 6-10, 1920, at Keokuk. All salesmen and branch managers were in attendance, talks by prominent men were given and a dinner and dance was held January 7. The close cooperation between the management and the employees is one of the features of this company and as one salesman remarked, "The whole company is like one large family, less the usual family disputes."

Robert J. Garrene, general manager of the New Ten Broeck Tire Co., recently entertained about five hundred employees and their families at the plant with a vaudeville and cabaret "par excellence." Walther Grote, factory superintendent and assistant general manager, mystified the audience with a sleight of hand performance. Allan Heine, advertising manager, next on the program with a violin solo, was followed by a professional interpretation of how they dance in Hawaii. After refreshments were served, a jazz orchestra furnished music for a dance, which was thoroughly enjoyed by everyone.

Inaugurating a new policy of establishing distributing centers for its products in various sections of the country, the Republic Rubber Co., Youngstown, Ohio, has opened a western distributing warehouse at First and St. George streets, St. Louis, Missouri, under the management of Edgar Evans. The St. Louis branch, which has just removed from 2020 Locust street to 1021, 1029 Arcade Building, will continue to be operated independently under the management of L. N. Bartlett, who will conduct a truck tire service department in the basement of the distributing center building.

Glenn H. Morris, formerly of Los Angeles, California, has been appointed advertising manager of Thomas E. Wilson & Co., Chicago, Illinois, dealers in sporting goods.

Claude Platt, who has been with The Fisk Rubber Co., Chicopee Falls, Massachusetts, for fourteen years, of late having served as special factory representative, has resigned to enter the retail automobile trade in Chicago, Illinois, his home city.

The Kerr Co., Fort Worth, Texas, has changed its address from 1501½ to 207½ Main street. It expects to begin actual construction of its plant in February and production about May 1. The officers are: A. H. Kerr, president and treasurer; J. A. Dacus, vice-president and general manager; J. A. Smith, secretary; F. X. Schuler, consulting engineer.

The Portage Rubber Co., Akron and Barberton, Ohio, has established a distributing warehouse in Chicago, Illinois, in addition to several new factory branches in various parts of the country.

PACIFIC COAST NOTES.

By Our Regular Correspondent.

LOS ANGELES NOTES.

THE EXECUTIVE OFFICES of the Samson Tire & Rubber Corp. have been removed from the factory at Compton to large and commodious quarters at 333 West Pico street, Los Angeles, where the service station has been located for several months. The company, of which Adolf Schleicher is president, manufactures cord tires.

William J. Kelly, dean of the rubber importers of the United

States, of the firm of Poel & Kelley, New York City, spent a fortnight in Los Angeles on his way to Honolulu with his daughter, Miss Jeannette Kelly. He also visited San Diego and San Francisco. During his Los Angeles sojourn he was a guest at the winter residence of Henry C. Pearson, publisher of THE INDIA RUBBER WORLD, and passed several hours on the golf links of the Brentwood Country Club.

Steps to organize a Pacific Coast Cotton Exchange were taken recently in Los Angeles when men identified with every phase of this growing industry in California and Arizona met at the Los Angeles Athletic Club. Leading cotton growers, shippers, manufacturers and representatives of local banks were present.

The Mohawk Rubber Co., of Akron, Ohio, has leased the ground floor of the Flower Auditorium Building, Los Angeles, where a factory branch in charge of Carl Laux will be established.

B. F. Wade, operating as the B. F. Wade Tire Co., of 512 East Eighth street, Los Angeles, has filed in the United States Court an involuntary petition in bankruptcy. The creditors asking that Wade be adjudged a bankrupt are the Canton-Blackstone Co., with a claim of \$17,516.93, the Tyler Rubber Co., of Andover, Massachusetts, \$13,675.43, and the Dayton Rubber Manufacturing Co., \$2,000. W. H. Moore, Jr., was appointed receiver for the concern under a bond of \$4,000.

Edward M. Snuffin, district manager of the Ajax Rubber Co. in Los Angeles, has returned from a two weeks' tour of Arizona during which he completed arrangements for the establishment of a factory branch in Phoenix.

What constitutes somewhat of an innovation in tire distribution methods has been inaugurated in southern California by the Rubber Products Co., of Barberton, Ohio, manufacturers of "Stronghold" and "Barberton" tires. As the result of recent negotiations the Ralphs Grocery Co., Los Angeles, becomes the distributor of these brands of tires and they will be placed before the consumer through the chain of seven Ralphs retail stores in Los Angeles and by other dealers in the surrounding towns.

J. B. Wood, distributor of Hewitt tires and tubes in Los Angeles, is planning to bring the factory basket-ball team from Buffalo to Los Angeles and is trying to arrange a series of games for the event with some of the best teams on the Coast.

H. G. Smith, manager of the Los Angeles branch of the Ajax Rubber Co., Inc., for the past four years, has resigned to accept a position in a different capacity. He was one of the best known figures on automobile row.

The Los Angeles branch of the Firestone Tire & Rubber Co., with a newly organized bowling team, has entered the first national telegraphic tournament organized by that company, scheduled for February 1. It is open to all branches of the company and will be rolled simultaneously on that night, the names of the individual players and their scores being telegraphed to Akron in code. A. G. Partridge, vice-president in charge of sales, has donated a beautiful trophy cup as a prize to become the permanent property of the team winning the title two years. E. M. Barlow, of the sales department, is manager of the Los Angeles team. The line-up is as follows: E. A. Douglas, captain; R. A. Guthridge, R. Y. Copelin, G. O. Fries, H. Johnston, R. W. Irwin and H. V. Wilson.

J. B. Linard, president of the Globe Rubber Tire Manufacturing Co., of Trenton, New Jersey, was a recent visitor in Los Angeles. He is said to be the youngest head of a tire concern in the United States. During his visit he was in conference with A. T. Smith, Pacific Coast representative of the Globe company and W. Reeve Gartzmann, manager of Hawley, King & Co., Southern California distributors.

Construction work is going forward rapidly on the new building being erected for the Miller Rubber Co. of California at 1239 South Olive Street, Los Angeles. The building, owned by Jonathan R. Scott, will cost \$26,000. It is a two-story brick structure especially designed for the local branch of the company.

Harold Austin Freeman, a graduate of the University of Southern California, class of 1916, is to be in charge of the chemical laboratory of the Goodyear plant at Los Angeles.

New Year's greetings from Frank R. Carroll, head of The B. F. Goodrich Co. interests in the Orient have been received in Los Angeles. He was formerly in charge of the Los Angeles branch, but was assigned to Japan, where American tires are making tremendous gains.

W. S. Thatcher, of the Los Angeles branch of the Brunswick-Balke-Collender Co. tire department, has received word of the expansion plans of the concern, by which the capacity of the plant has been doubled. Samuel J. Turnes, general sales manager in California, accompanied by E. Tatman, assistant sales manager, recently paid a visit to Los Angeles.

Louis Lichtenberger, president of the Lichtenberger-Ferguson Co., factory distributor of Norwalk tires in Los Angeles, says that January is a heavy buying month in the tire trade while December is the slowest month of the year. The low ebb is due to weather conditions and to the fact that dealers do not want to carry a big stock through their annual inventory period which usually takes place the first of each year. According to Mr. Lichtenberger, the following is a table of percentage for the year's distribution of tires throughout the country based on three years' records:

Month.	Per Cent.	Month.	Per Cent.
January	10 1/10	July	10 4/10
February	8 4/10	August	9 5/10
March	10 3/10	September	7 1/10
April	8 3/10	October	6 4/10
May	9 8/10	November	4 9/10
June	10 1/10	December	4 7/10

Marshall E. Morris, manager of salesmen for The Goodyear Tire & Rubber Co., has been appointed a member of the board of directors of The Goodyear Tire & Rubber Co., of California. Mr. Morris first came to the Goodyear company as manager of the carriage tire department in 1912. Since that time his rise has been remarkable even for the rubber industry.

Frank Westerhoff, who formerly represented the Standard Four Tire Co., Keokuk, Iowa, in Illinois, has been appointed manager for the company at its branch at 348 West Pico street, Los Angeles.

A movement has been started to make Los Angeles, California, the terminus of the Lincoln Highway. The proposal is to establish a branch of the great transcontinental highway from Ely, Nevada, to the California city, a distance of 770 miles. Ely is the first town reached after crossing the desert section of the Great Salt Lake country.

NORTHWESTERN NOTES.

Leavens & Howard, of Portland, Oregon, Pacific Northwest distributors for the Sewall cushion wheel for trucks, have opened a branch in Seattle.

The Western Rubber Co. has begun to manufacture tires in its new plant in South Tacoma, Washington. Machinery was installed early in the year, there being some little delay in getting shipments. The plant is so located that raw rubber can be handled from ship side to the factory direct. The plant started with a working force of 125 men. Elmer Dover, former secretary of the Republican National Committee, and later Pacific Coast manager for Byllesby & Co., operators of public service plants, is president of the concern.

The Washington Tire & Rubber Co., Spokane, Washington, started operations in a small way in May, 1919, and entered its

first full year's production January 1, 1920. The production will reach 200 casings and 200 tubes a day during February, to be increased from month to month. At the present time 120 workers are employed, 94 per cent of whom are stockholders in the company.

Although its estimated production for 1920 was placed at 60,000 casings and 40,000 tubes, it is believed that the demand for its product, which is being marketed under the trade name "Western States," will increase to 100,000 casings and 100,000 tubes this year. At present fabric tires only are made, but later cord tires will be manufactured.

The officers of the company are all representative and well known Spokane business men. The president is A. G. Hanauer, vice-president, T. S. Lane, and secretary-treasurer, H. S. Burdick.

CANADIAN NOTES.

THE NEW PRICE LIST on rubber footwear was issued in Canada on December 26, 1919, instead of two months later as is usual. The prices are considerably higher than the old list, being approximately from 10 to 15 per cent more on light lines and from 15 to 20 and 25 per cent on other goods. Advances in the cost of raw stocks and labor are given as the reasons for the issuing of the new price list at the earlier date.

The Canadian Board of Commerce, on November 26, 1919, issued an order that the margin of gross profit on sales of boots, shoes, rubbers, overshoes, etc., in retail shoe stores shall not exceed 33 1/3 per cent of the sale price.

Gutta Percha & Rubber, Limited, held a meeting of branch managers in Toronto recently, at the King Edward Hotel. The Ontario division extends to Brockville in the East, to Sarnia in the West, and to North Bay in the North.

The Canadian Shoe Manufacturers' Association held its annual convention in Quebec City, at Chateau Frontenac, January 20-21.

The Ames Holden McCready System, Rubber Section, has appointed H. A. Braendle, M. A., physicist in charge of its Montreal laboratories and H. F. Schippel, B. Sc., research engineer. Mr. Braendle is a graduate of the University of Toronto where he conducted research work on colloids under Professor E. F. Burton, while Mr. Schippel was formerly on the staff of McGill University. Both men were also more recently with the general laboratories of the Canadian Consolidated Rubber Co., Limited.

W. B. Wiegand, formerly general technical superintendent of the Canadian Consolidated Rubber Co., Limited, has been appointed director of manufacturing for the Rubber Section of the Ames Holden McCready System, Montreal, Quebec.

The British & Foreign Agencies, Limited, 17 St. John street, Montreal, Quebec, has secured the exclusive Canadian agency for "Lastawl" fibrous rubber soling manufactured by Tine "Lastawl" Co., 132 Boundary street, Liverpool, England.

The Canadian Customs Department has ruled on the duties to be levied on a number of articles containing rubber, making them invariably higher than the British preferential rates. The rates are: Belting, not of leather, 27 1/2 per cent ad valorem; belts, other than transmission belts, 17 1/2 per cent; finished parts of garters and hose supporters, 20 per cent; brake lining, 30 per cent. The last article is subject in addition to a war tax of 7 1/2 per cent ad valorem.

QUEBEC IN 1918 EXPORTED 159,175 TONS OF ASBESTOS AND ASBESTIC, valued at \$9,053,945, as compared with 154,452 tons, valued at \$7,240,697 in 1917. The stock on hand December 31, 1918, was 14,609 tons of the value of \$2,085,395. The average value per ton of asbestos in 1918 was \$63.35, as against \$52.45 in 1917. Of the 1918 exports 6,518,687, more than two-thirds, went to the United States.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

MANUFACTURERS in the United Kingdom are hoping that 1920 will open with the resuscitation of THE INDIA RUBBER WORLD, or rather a cessation of its suspended animation. We have our own labor worries here of one sort or another, but so far our trade journals have come out regularly.

Although the country is supposed to be on the verge of bankruptcy there seems to be plenty of money for investment, as well as for personal requirements. I hear that the Greengate Rubber Co.'s issue of new capital was quickly subscribed for, and there have been other concerns, including the St. Albans Rubber Works, which make the Grimsdon tire, that have done well in this respect. The Eastern produce firm of Harrisons & Crossfield, Limited, who are largely concerned with plantation rubber, have raised their capital to £2,525,000 and made an issue of 400,000 shares of 10 per cent cumulative preferred ordinary stock at £1 each, to be used for the general purposes of the business.

INTEREST IN COTTON MILLS CONTINUES.

The speculative boom in cotton mills shows no abatement and the Chancellor of the Exchequer is considering where he is to come in on the profits which are being made. With regard to the price of cotton goods, which will certainly not be easier in the near future, Mr. Ormrod, when presiding at the annual meeting of the Dunlop Rubber Co., mentioned that the price of cotton duck is now 400 to 500 per cent over pre-war prices. No doubt the new invasion of America by the Dunlop tire will receive due notice in THE INDIA RUBBER WORLD, and I shall not comment on it here.

RUBBER AND POLITICS.

The "Anti-Dumping Bill," to give it its popular name, will probably not be heard of again, as its provisions are distasteful to Protectionists and Free Traders alike. Quite probably it will be replaced by a simpler measure dealing with the so-called "key industries" alone. This will mean that such few rubber goods as we import into this country will be able to come in without irksome formalities. Mr. Justice Sankey's ruling that the banning of imported goods by the Board of Trade is illegal has naturally made a big stir and much interest is centered upon the government's appeal to the House of Lords. Pending this appeal, banned goods, interesting to rubber manufacturers, notably zinc oxide and lithopone, will be allowed in, but importers are warned that if the government's appeal succeeds, the importers will have to face the consequences of their action.

I have not heard from any unbiased source whether the zinc oxide now being made in England is quite equal to that which used to come from the Vicille Montagne Co. on the Continent, or whether it is only on a par with what used to be obtained from America, this latter never having been considered equal to the continental, though it had an advantage in price. Now that the use of lithopone as a substitute for zinc oxide has become so firmly established, the latter is not likely to be in the same general demand as in pre-war days. An important point with regard to the present unrestricted import of zinc oxide and lithopone is that the government is not in a position to restrict importation from countries affected by a collapse in exchange, unless or until enabling legislation for the purpose is enacted by Parliament.

ADVISORY COMMITTEE FOR AERONAUTICS.

A preliminary report on the variation of the hydrogen permeability of rubber membranes with alteration in temperature was made to the above government committee during the war by D. B. Porritt and W. S. Allen, the work having been carried

out by them in the research department of the North British Rubber Co. It was expected that the results of the investigation would prove of benefit both in the design of laboratory testing apparatus and as indicating the results which might be expected from an envelope under the ordinary condition of usage. A few previous experiments carried out at that National Physical Laboratory showed that the variation due to temperature amounts to about 7 per cent per degree centigrade. The plotted curve of the North British results show a consistent increase in permeability as the temperature rises. Thus the loss of hydrogen in liters per square meter per 24 hours was as follows:

Period of Time.	Temperature, Degrees.	Loss of Hydrogen in Liters.
24 hours.....	1.0 C.	2.26
24 hours.....	7.5 C.	3.31
24 hours.....	15.0 C.	4.36
24 hours.....	25.0 C.	8.19

These results, the authors say, clearly illustrate the necessity for the careful regulation of temperature when testing balloon fabrics for gas tightness. They further show the increased loss of gas which must be experienced by airships in the summer months and point to the desirability of adopting every available precaution to keep the interior of sheds at a low temperature, whether by ventilation, refrigeration or by protecting the roof by some heat reflecting composition. The gas loss from the upper surface of a balloon fabric in sunshine, they say, must be very serious since the surface of the fabric will absorb a considerable amount of heat. Variations in atmospheric pressures are unimportant.

THE MACKINTOSH TRADE.

There is considerable demand for waterproofs, and many developments are noticeable compared with the trade of five years ago. Greater warmth is a feature which came in with the war. Thus we have the mackintosh with a detachable fleece lining, being adaptable for either summer or winter use. With regard to the high-class mackintoshes, lined throughout with white fur, put on the market by an important firm of London outfitters at a price in the neighborhood of 14 guineas, I doubt if the sales will continue to any extent now that trench warfare is a thing of the past.

These coats are uncomfortably hot to walk about in, though for standing about, or for driving in, when the weather is wet, as well as cold, they form an important addition to one's ordinary outfit. These coats do not seem to be very well known, as a proof and maker-up of garments told me he had never seen or heard of one. An ordinary fur coat has, of course, a long life (moths permitting), but the ordinary vulcanized mackintosh has not, and it seems to me that the combination of the two, even though the fur is not the chinchilla variety at a guinea an ounce, must always remain an article of luxury for the wealthy. Another new feature is the triple-proof raincoat, i. e., a rain-proof coat interlined with rubber, the main object being greater warmth, this being the desideratum of both sexes.

TRADE NOTES.

The boot polish department of Wood-Milne, Limited, has been disposed of to Hargraves Bros. & Co., Limited, Hull. Now that the Wood-Milne company has become such a large concern in the tire world, it is not altogether surprising that business of less importance and of more competitive character should be disposed of to specialists.

It is announced that electric cables are to be made at Woolwich Arsenal. Various schemes have been mooted for the use

of spare government buildings for this or that trade purpose, and manufacturers interested have generally opposed them. It will be interesting to see if anything of the sort occurs in this case.

The report of the India Rubber, Gutta Percha and Telegraph Works Co., Limited, of Silvertown, shows a profit of £71,913, a reduction on last year. This is stated to be due to the various difficulties arising out of the reconstruction period, leading to a diminution in output.

At the annual meeting of W. & A. Bates, Limited, Leicester, when there was declared a profit of £42,972 and a dividend of 10 per cent for the year, the chairman, P. H. Lockhart, spoke at length on the importance of motor transport in the present congested state of the railways, saying that arrangements are being made to cover every town and village in the county by a motor system. Mr. Lockhart is now with Alex Johnstone and J. Tinto, a vice-president of the Federation of British Industries.

During a violent gale, which occurred on the day predicted for the end of the world, considerable damage was done to the Globe Rubber Works, Manchester, a huge shed about 200 feet long being lifted bodily from its supports and carried 20 or 30 feet by the wind until it crashed into the firm's offices.

William Symington & Co., Limited, 22 Fenchurch street, London, E. C. 3, has changed its name to "General Rubber Co., Ltd.," in order to have a uniform style for all branches in the various rubber-producing and consuming markets of the world.

Hale & Son, 10 Fenchurch avenue, London, E. C. 3, dealers in crude rubber, have taken William B. J. Horne into partnership. Mr. Horne has been associated with the firm for the last fourteen years.

While \$25,000,000 worth of first-class American automobile tires were allowed to rot at Verneuil, France, according to the "American Economist," the British Government made arrangements by which the Hercules Tyre Co. will take over the sale of all the pneumatic tires and tubes discarded by the British army in France. Some of these have been sent to the French works, the others are returning by shiploads to England from Marseilles, Calais, Boulogne and St. Malo.

Liverpool imported from the United States in 1918 gutta percha of the value of \$703,676, and manufactured rubber goods valued at \$910,399, motor cars and rubber tires and tubes valued at \$517,279, rubber shoes valued at \$254,774, and waterproof garments worth \$67,785.

BRITISH KEY INDUSTRIES TO BE PROTECTED.

THE IMPORTANT RESTRICTIONS intended to shield British industry during the period of demobilization and of change from war to peace conditions came to an end September 1, and the future trade policy of the United Kingdom as announced by the Prime Minister embraces three proposals of interest to the rubber industry of the world. They are that Parliament deal effectively with dumping; that it equip the Board of Trade with emergency powers to check a sudden and undue importation of goods at prices altogether below the cost of production in the United Kingdom, owing to the collapse of exchanges; also that the Board of Trade be empowered to prohibit the import, except under license, of goods which are in competition with key industries.

Their object is to defend the United Kingdom against unfair competition that might destroy certain unstable key industries that could not be maintained in the face of extensive dumping of foreign goods beneath the price at which they are sold in the country where produced, and of German goods at exchange rates so extravagantly in favor of Great Britain that the goods would

sell at prices not only lower than those current in Germany, but lower than the cost of production in Great Britain. By unstable key industries is meant those essential for war or the maintenance of the country during war; those of inadequate producing capacity to meet the nation's war needs; those requiring Government aid in war time, and those unable without such aid to maintain themselves at the level of production shown by war to be essential to the national life.

That the British rubber goods manufacturing industry is essential for war is obvious, and that the United Kingdom desires to maintain its independence in the manufacture as well as the production of rubber is certain. The high American exchange rate is unfavorable to England, yet while the determination to abandon further support of exchanges may cause a further rise in American exchange, and will doubtless increase the cost of many raw materials obtained from America, it will also raise a higher barrier against the import of American manufactured goods which are considered essential to stimulate greater home production.

Thus far rubber products have not been specifically mentioned among the key industries to be protected, although certain raw materials used in the manufacture of rubber goods have been listed. Pending legislation, a general license under Prohibition of Import Proclamations will be issued by the Board of Trade, having effect as from September 1, 1919, and authorizing the importation into the United Kingdom of all goods not specified in a list consisting of synthetic drugs, organic chemicals and numerous miscellaneous commodities, the only items of prime interest to the rubber industry being zinc oxide and lithopone.

The preferential tariff dating from September 1 last, which explicitly favors goods coming from British colonies and possessions, takes the place of the war restrictions which expired in August. Under these restrictions foreign tires could not be imported free. The new tariff arranges that motor cars and parts thereof "from the colonies shall pay only two-thirds of the full rate." The British Rubber Tyre Manufacturers' Association, as its chairman declared at the annual meeting, made a big fight to prevent the restrictions from being removed on tires, then tried to have tires defined as "parts thereof" in the tariff, and now will endeavor to have tires included in the next budget as dutiable. He also declared that the British tire trade must be made as strong as the transatlantic competition, that no one concern could meet the coming demand and that all the manufacturers should work together. That Great Britain must right the balance as regards the consumption of rubber and that the bulk of British-produced rubber should be used in British factories. The Association is an amalgamation of British tire manufacturers, among them the Dunlop company, which has started an aggressive American campaign and is big enough to resemble a trust.

WHEN TANKS WERE FIRST USED IN THE WAR, THE BRITISH WAR Office originally intended to equip them with balata belting. Experiments by Sir William Triton at Lincoln in August, 1915, put an end to that project.

RUBBER HAS BEEN SOLD IN LONDON AS FAR AHEAD AS 1923 AT 2s. 4½d. a pound ex warehouse. For 1920 and 1921 the price has been 2s. 6½d.

A SWEDISH SYNDICATE IS BEING FORMED AT STOCKHOLM ON THE lines of the old East India Co. of Gothenburg, with a capital of 30,000,000 kroner*, whose main object is to buy rubber and other plantations in the Dutch East Indies, to work them by modern methods and ship the products by steamer direct to Sweden.

*One krona equals \$0.268 United States currency.

Rubber Planting Notes.

PLANT DISEASE ALARMS UNWARRANTED.

While admitting that the question of rubber diseases in the Far Eastern plantations is important and noting that everyone can see the marks of them on the trees and that the reason why many estates are reported to be immune is that they have not been examined scientifically, "The India-Rubber Journal" is inclined to be ironical about disease scares, ascribing much of their severity to the imagination of the local press in enumerating the successive scourges which have not interfered with the development of the plantations.

The first alarm was over *Fomes* and other fungi that attacked the roots; then came the black stripe canker which affected tapped trees; this was followed by *Ustilina*, and the latest is the brown bast disease, of which the cause is yet undiscovered. The pink disease alone so far, though ever present, has not aroused concern. So long as no leaf disease attacks *Hevea brasiliensis*, rubber producers need not fear.

RUBBER RESEARCH IN CEYLON.

Rubber research was interfered with by the calling away of investigators for war service. The Rubber Growers' Association did not favor the plan of having all research combined and directed from a central body in England. Plans are formed for training young men to inspect the rubber districts in the way the tea districts are now inspected. A book on "Rubber Research in Ceylon" is to be published soon; it is made up of the bulletins that have been issued by the Ceylon Research Commission.

The investigation of rubber diseases is kept up in Ceylon, Professor T. Petch at Peradeniya having received 232 specimens. He reports that brown bast has spread throughout all the rubber districts, though it is more common in the drier regions. The cause and nature of the disease has not yet been fully decided upon, and the measures taken to overcome it seem to have varying success in the different provinces.

INVESTIGATIONS OF HEVEA IN MALAYA.

Variation in the *Hevea brasiliensis* that grows in Malaya have been studied closely by Stafford Whitby, who gives the results in the "Annals of Botany." His investigations concerned the amount of rubber yielded by individual trees of the same age and growing under the same conditions, and also the possible relation between the girth of the trunk and the yield of rubber. About 1,000 seven-year-old trees in their third year of tapping on a normal plantation of about 13 acres, were under observation. As the seed from which the eastern plantations were grown was not selected seed the results are of particular interest.

Great variations were found in the rubber content of the latex of different trees, but the strength of the latex was constant for each tree, as a rule. Some trees yielded only 23 grams of rubber to 100 cubic centimeters of latex, and others yielded 54 to 55 grams; the mean of 243 trees examined was 36.58 grams to 100 cubic centimeters. Moreover, the older the tree the larger the rubber content; Mr. Whitby sets the yearly increase at $\frac{1}{2}$ gram.

The yield of individual trees was found to be comparatively constant, a tree that was a high yielder at one time continued to be a high yielder through the two years of observation. The results were drawn from the examination of 1,011 seven-year-old trees. A large number of trees yielded from nothing to two grams a day, a few yielded over 27 grams; the average was 7.12 grams. Less than a tenth of all the trees yielded 28 per cent of the total, while over an eighth gave only 2.9 per cent of the yield, and certainly did not pay for tapping. Four excep-

tional trees yielded 41.45, 41.56, 41.72 and 42.77 grams a day. The possibilities of improving rubber yield by a proper selection of seeds seems clear.

The investigation into the girths, while it showed that trees with large trunks were good yielders and those with small trunks poor yielders, did not determine the matter clearly enough to justify destroying trees. The investigation of A. A. L. Rutgers in Sumatra, printed in the "Archief voor de Rubbercultuur Nederlandsch-Indië," agree with Mr. Whitby's results.

It is not possible under present plantation conditions, where high and low-yielding trees are intermixed, to determine whether seeds from a high-yielding tree will produce other trees that are also high-yielding. To decide that, the young trees should be segregated so that the pollen from the poor yielders cannot fall upon them.

SCIENTIFIC RUBBER PLANTING IN INDO-CHINA.

At Saigon, in French Indo-China, an official rubber laboratory has been established as a branch of the local Pasteur Institute, with Dr. Lahille in charge of it. Governor-General Maspéro took on himself the responsibility of adding the money needed to the budget. The Scientific Institute of Indo-China has also been brought into being, whose agricultural department will supervise *Hevea* culture as one of its functions. Both laboratory and institute will work, so far as rubber is concerned, in close connection with the newly instituted rubber department of the Marseilles Colonial Institute, which is in charge of Dr. Van Pelt.

WHITE ANT EXTERMINATOR.

The termites or "white ants," as they are usually called, are troublesome pests on rubber plantations where they enter the roots of the trees and often excavate the stem. The depth of

DESTROYING WHITE ANTS ON A RUBBER PLANTATION.

the insect burrows varies from a few inches to four feet but the length is considerable in some cases, having been traced 300 feet from the nest.

Soil insecticides are said to be practically useless in exterminating these pests and fumigation is the only satisfactory method. A poisonous white ant powder is heated in a machine comprising a charcoal furnace, generating fumes that are forced into the burrows by means of an air pump. All openings being sealed with clay, the fumes will destroy the ants and eggs in a few days' time. (The Four Oaks Spraying Machine Co., Four Oaks, Sutton Coldfield, near Birmingham, England.)

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED DECEMBER 2, 1919.

- 1,323,259 Puncture proof tire. H. A. Falvey, Chicago, Ill.
 1,323,267 Remountable rim for tires. L. De Holzer, Sioux City, Iowa.
 1,323,268 Ear air douche. C. F. Gottfried, Brooklyn, N. Y.
 1,323,269 Inking pad of sponge rubber. C. H. Payne, Cincinnati, Ohio.
 1,323,270 Collapsible pneumatic mattress. G. B. Price, Topeka, Kan.
 1,323,271 Rubber tread trucker. R. G. Hall, 616 Morgan Building, Portland, Ore. This invention was described in THE INDIA RUBBER WORLD July 1, 1918, page 607.
 1,323,272 Surgical appliance. H. G. Callaghy, Providence, R. I.
 1,323,273 Stream-line shield for cables, stay wires, and the like. R. H. Tyson, assignor to The Goodyear Tire & Rubber Co.—both of Akron, Ohio.

ISSUED DECEMBER 9, 1919.

- 1,323,274 Resilient tire. J. E. Mackay, Los Angeles, Calif.
 1,323,275 Vehicle tire with inflatable inner tube having a confining layer of inelastic material extending transversely around it, but extending across the tube at the valve to provide a reinforced valve seat. E. Sterns, St. Louis, Mo., assignor by mesne assignments to Surety Tire & Rubber Co., Wilmington, Del.
 1,323,276 Protective covering for pneumatic tires. C. Allen, Sydney, New South Wales, Australia.
 1,323,277 Auxiliary tire as pneumatic tire protector. C. Allen, Sydney, New South Wales, Australia.
 1,323,278 Heel retainer. J. E. Ludlam, Bridgeport, Conn.
 1,323,279 Tire tread. L. Schissel, Brooklyn, N. Y.
 1,323,280 Fountain pen. B. B. Bradford, Fort Madison, Iowa.
 1,323,281 Animal head with rubber lined mouth, for pie pieces, etc. T. Cohen and M. Lichtenstein—both of New York, N. Y.

ISSUED DECEMBER 16, 1919.

- 1,324,941 Air-cooled vehicle tire with rubber blocks in air chambers. T. C. Watkins, Ingram, Pa.
 1,324,993 Rubber heel. C. C. Madlock, assignor to R. E. Miller, Inc.—both of New York, N. Y.
 1,325,012 Low air pressure signal for tires. D. D. Getman, White Butte, S. D.
 1,325,017 Wind shield wiper. L. C. Hill, assignor to Packard Motor Car Co.—both of Detroit, Mich.
 1,325,019 Relief valve for pneumatic tires. C. A. Hussey, Battle Creek, Mich.
 1,325,141 Reinforced pneumatic tire. H. G. Cave, New York, N. Y.
 1,325,233 Pneumatic tire with three air chambers separated by rubber webs. J. D. Coover, assignor of one-third to W. Parsons—both of Toronto, Ontario, Canada.
 1,325,364 Reinforced tire. J. G. Lowe, Shelby, Ala.
 1,325,367 Rubber heel. C. T. Madlock, Elyria, assignor of one-half to J. G. Schullian, Cleveland—both of Ohio.
 1,325,389 Anti-skidding attachment for tires, with rubber blocks. J. B. Adams, Boston, Mass.
 1,325,391 Rubber hand stamp. E. S. Burroughs, Liverpool, England.
 1,325,392 Fountain pen. G. T. Byers, Nyack, N. Y.
 1,325,443 Fountain pen. F. W. Lee, Spokane, Wash.
 1,325,448 Non-metallic wall for reservoirs having an inner coating of material insoluble in the lighter hydrocarbons and an outer self-sealing envelope composed of a layer of non-vulcanized rubber between two sheets of vulcanized fabric. A. Macbeth, assignor to Societe The Dunlop Rubber Co., Limited—both of Paris, France.

REISSUES.

- 1,170,770 Remountable rim for tires. H. Bretscher, New York, N. Y., assignor of one-half to Felix Spitzner.

ISSUED DECEMBER 23, 1919.

- 1,325,607 Bathing's wrist appliance to serve as pocket. E. H. Barber, Worcester, Mass.
 1,325,695 Resilient heel. T. Fay, assignor to The Fay Rubber Products Co.—both of Elyria, Ohio.
 1,325,714 Remountable rim. F. Copithorne, Natick, Mass.
 1,325,717 Garter. R. Gorton, Brookline, Mass.
 1,325,798 Patch fabric and method of manufacture. J. G. Mooney, Erie, Pa.
 1,325,822 Rubber heel for shoes. G. F. Wells, Elyria, Ohio.
 1,325,833 Rubber cushion wheel. H. H. Damon, Los Angeles, Calif.
 1,325,844 Fountain pen. H. S. Hasselquist, Chicago, Ill.
 1,325,903 Device for cleaning windshields. C. B. O'Neill, Clymer, Pa.
 1,325,918 Tire valve and alarm. F. H. Valiton, Deer Lodge, Mont.
 1,325,990 Remountable rim for tires. L. H. Perlman, New York, N. Y.
 1,326,145 Wiper wiper. G. S. Stadelker, Chicago, Ill. For description see THE INDIA RUBBER WORLD, November 1, 1918, page 89.
 1,326,154 Pneumatic tire. J. A. Johnson, Greenfield, assignor, by direct and mesne assignments, to W. P. Tire Company—both of Indianapolis, Ind.

ISSUED DECEMBER 30, 1919.

- 1,326,180 Tire lock. W. T. Campbell, St. Louis, Mo.
 1,326,181 Hose coupling. A. C. Peters and A. L. Johnson, assignors to The Conklin Pen Manufacturing Co.—both of Toledo, Ohio.
 1,326,250 Hose coupling. A. C. Peters and A. L. Johnson, assignors to The Conklin Pen Manufacturing Co.—both of Toledo, Ohio.
 1,326,418 Remountable rim. F. J. Jones, Los Angeles, Calif., U. S. A.
 1,326,437 Motor vehicle wheel. C. Boys, Westminster, England.
 1,326,444 Tire. J. Fiske, Detroit, Mich.

- 1,326,445 Pneumatic or air valve for inflating various bodies. T. H. Fewlass, Detroit, Mich.
 1,326,455 Dust cap for tire valves. P. W. Kautzman, West Hoboken, N. J., assignor to A. Schneider's Son, Inc., Brooklyn, N. Y.
 1,326,456 Shoeing tractor of vulcanized rubber and fabric. A. L. Stehler, Jr., Plainfield, N. J.

THE DOMINION OF CANADA.

ISSUED DECEMBER 2, 1919.

- 134,338 Wheel rim. L. L. Broyles, Vancouver, Washington, U. S. A.
 134,337 Patch for tires. J. N. Davis, Denver, Colorado, U. S. A.
 134,376 Tire having means for carrying air under super-atmospheric pressure. W. Huber, Ottawa, Ontario, Canada.
 134,475 Disk wheel with pneumatic tire. The Interlocking Rim and Wheel Company, assignor of L. B. Harvey, both of San Francisco, Calif., U. S. A.
 134,484 Rubber seal. R. E. Miller, Inc., assignor of Wilber C. Bulman—both of New York City, U. S. A. For description see THE INDIA RUBBER WORLD, December 1, 1919, page 157.

ISSUED DECEMBER 9, 1919.

- 134,517 Renewable tread for tires. J. H. Gill and J. D. Rea—both of Dunedin, New Zealand.
 134,611 Wheel with demountable rim. C. F. Rubsam, New York City, U. S. A.
 134,630 Demountable wheel rim. E. Oliver, Daytona, Florida, U. S. A.
 134,642 Respirator. I. W. Paul and C. Hall—both of Pittsburgh, Pa., U. S. A.
 134,651 Pneumatic tire. H. Bretscher, New York City, U. S. A.
 134,668 Demountable wheel rim. E. Eggenman, Madison, Wis., U. S. A.
 134,683 Pneumatic suspension for vehicles. J. Hofmann, Aiken, South Carolina, U. S. A.
 134,689 Pneumatic tire. E. A. Jones, Los Angeles, Calif., U. S. A.
 134,691 Rubber tire. E. B. Kullen, London, E. C. 4, England.
 134,707 Demountable rim. J. H. Miskimen, Glendive, Montana, U. S. A.
 134,714 Pneumatic tire. W. D. McNaull, Toledo, Ohio.
 134,729 Rubber shoe sole of fabric and composition. J. Solomon, Oberlin, Ohio, U. S. A.
 134,732 Hose coupling. A. A. Stove, London, England.
 134,738 Dual pneumatic wheel rim. E. C. Walters, Akron, Ohio, U. S. A.
 134,772 Hose coupling. The Independent Pneumatic Tool Co., Chicago, assignor of J. T. Nelson, Aurora—both in Illinois, U. S. A.
 134,778 Piston packing. H. W. Johns-Manville Co., assignor of G. Christenson—both of New York City, U. S. A.
 134,779 Piston packing. The H. W. Johns-Manville Co., assignor of G. Christenson—both of New York City, U. S. A.
 134,780 Packing ring of rubber and fiber. The H. W. Johns-Manville Co., assignor of G. Christenson—both of New York City, U. S. A.
 134,793 Detachable wheel rim. The Rapid Remountable Rim Co., assignor of O. P. Edstrom—both of San Francisco, Calif., U. S. A.
 134,803 Hose coupling. The S. S. White Dental Mfg. Co., Philadelphia, Pa., assignor of W. R. Porter, Prince Bay, N. Y.—both in U. S. A.

ISSUED DECEMBER 16, 1919.

- 134,836 Rubber shoe sole. J. C. Jardine and J. Dickie—both of Summerside, Prince Edward Island, Canada.
 134,846 Spring tire. W. Ashcroft, Garson Quarry, Manitoba, Canada.
 134,848 Spring tire. H. C. Babel, Buffalo, N. Y., U. S. A.
 134,876 Tire with sponge rubber core and air chamber. A. A. Crozier, London, England.
 134,877 Tire with sponge rubber core and air chamber. A. A. Crozier, London, England.
 134,878 Pneumatic tire of treated, rubber-coated rawhide. A. A. Crozier, London, England.
 134,801 Automobile tire rim. E. P. Dill, Pittsburg, Kansas, U. S. A.
 134,920 Resilient tire. J. Jozak, Milwaukee, Wis., U. S. A.
 134,938 Demountable rim for tires. H. F. Mulcahy, East Fremantle, Western Australia, Australia.
 134,943 Demountable tire rim. W. W. McRea, Waikariri Canterbury, N. Z.
 134,988 Pneumatic tire. W. N. Stephens, Toronto, Ontario, Canada.
 135,008 Tire tube. H. N. Wayne, Los Angeles, Calif., U. S. A.
 135,045 Cushion tire. The Lambert Multiplex Co., assignor of H. M. Lambert—both of Portland, Oregon, U. S. A.
 135,075 Pneumatic tire. Peter Malacos and M. Bratis, assignor of a half interest, both of Wheeling, West Virginia, U. S. A.

ISSUED DECEMBER 23, 1919.

- 135,105 Demountable rim for tires. F. Spranger and N. M. Spranger—both of Detroit, Mich., U. S. A.
 135,118 Listening apparatus with pneumatic cushions. A. Bloch, Paris, France.
 135,121 Pneumatic tire. T. Bradshaw, Oakland, Calif., U. S. A.
 135,123 Demountable tire rim. F. A. Jones, Los Angeles, Calif., U. S. A.
 135,194 Demountable tire rim. F. A. Jones, Los Angeles, Calif., U. S. A.
 135,211 Surgical bust substitute. L. A. Melrose, British Columbia, Canada.
 135,251 Stomper for rubber bath tubs, etc. M. C. Schweinert, West Hoboken, N. J., U. S. A.
 135,296 Stethoscope. L. D. Pollard, Chicago, Ill., U. S. A.

ISSUED DECEMBER 30, 1919.

- 135,401 Pneumatic tire. J. E. Beesland, East Chicago, Ill., U. S. A.
 135,403 Spring tire. J. P. Riesmeyer, Oquamos, Mo., U. S. A.
 135,411 Collapsible rim for tires. J. A. Brereton, Toronto, Ontario, Canada.

- 54,263. Tire. Patented December 9, 1919. Term 14 years. G. Hubach, Springfield, assignor to The Fisk Rubber Co., Chicago Falls 1 & 2 in. Masadadits.
- 54,264. Tire. Patented December 9, 1919. Term 14 years. G. Hubach, Springfield, assignor to The Fisk Rubber Co., Chicago Falls 1 & 2 in. Masadadits.
- 54,273. Tire cover. Patented December 9, 1919. Term 14 years. P. M. Lockwood, Kansas City, Mo.
- 54,274. Tire cover. Patented December 9, 1919. Term 14 years. P. M. Lockwood, Kansas City, Mo.
- 54,275. Tire cover. Patented December 9, 1919. Term 14 years. P. M. Lockwood, Kansas City, Mo.
- 54,276. Tire tread. Patented December 9, 1919. Term 7 years. C. W. McKinnon, assignor to The Gordon Tire & Rubber Co.—both of Canton, O.
- 54,281. Tire. Patented December 9, 1919. Term 14 years. C. E. Murray, Jr., assignor to Empire Rubber & Tire Co.—both of Trenton, N. J.
- 54,286. Tire. Patented December 9, 1919. Term 7 years. C. Spreckels, assignor to The Savage Tire Co., San Diego—both in California.
- 54,287. Tire. Patented December 9, 1919. Term 7 years. C. Spreckels, Colorado, assignor to The Savage Tire Co., San Diego—both in California.
- 54,288. Tire casing. Patented December 9, 1919. Term 14 years. K. H. Stohenvill, assignor to Gillette Rubber Co.—both of Lay, Calne, Wis.
- 54,291. Tire. Patented December 9, 1919. Term 7 years. J. Tenney, Jr., Plainfield, N. J.
- 54,306. Tire. Patented December 23, 1919. Term 14 years. J. F. Burall, assignor to Liberty Tire & Rubber Co.—both of Green Bay, Wis.
- 54,310. Pneumatic tire. Patented December 23, 1919. Term 14 years. A. Hargraves, Akron, O., assignor to Froehl Tire & Rubber Co., Chicago, Ill.
- 54,321. Tire tread. Patented December 23, 1919. Term 14 years. H. L. Kenyon, Sateuket, N. Y.
- 54,324. Tire. Patented December 23, 1919. Term 14 years. J. W. Maguire, assignor to The Brunswick-Balke-Collender Co.—both of Chicago, Ill.
- 54,329. Tire. Patented December 23, 1919. Term 14 years. G. Nowick, Kansas City, Mo.
- 54,330. Tire casing. Patented December 23, 1919. Term 7 years. W. C. Owen, Cleveland, O.
- 54,337. Tire. Patented December 23, 1919. Term 3½ years. F. W. Smith, Rutherford, N. J.
- 54,345. Square tire. Patented December 23, 1919. Term 7 years. T. Zeger, Sharpsburg, Pa.

- 54,348. Tire. Patented December 30, 1919. Term 7 years. H. G. Egbert, Dayton, O.

THE DOMINION OF CANADA.

- 4,689. Tire tread. Patented November 25, 1919. The Gregory Tire & Rubber Co., Limited, Vancouver, B. C.
- 4,694. Clamp for windshield wipers. J. C. J. J., and E. E. Palmer, trading as Royal Simplex Wind Deflector Co., Toronto, Ont.

CHEMISTS AVAILABLE FOR RUBBER WORK.

The Chemical Warfare Service of the War Department has established an employment bureau under the charge of Major Frederick M. Crossett as director, which is ready to supply skilled chemists to any business that requires their services.

The Government employed 5,400 chemists during the war, who could not hope to obtain honors or distinction for their work. Many of these are unable to go back to the work they did before, owing to the changed conditions. The director has a list of chemists who can be used in the rubber industries.

JUDICIAL DECISIONS.

GENERAL ELECTRIC Co. vs. CONTINENTAL FIBRE Co.—United States Circuit Court of Appeals, Second Circuit, February 13, 1919.

Infringement of Patent No. 1,061,770. Miller made a gear or cog-wheel of highly compressed cotton, held under compression by metallic end plates secured by rivets passing through the cotton. Defendant makes disks of cotton duck impregnated with bakelite, 60 per cent duck and 40 per cent bakelite, which can be cut into gears. Held that, when used for gears, it violated Miller's Patent. ("The Official Gazette," United States Patent Office, November 4, 1919.) ("Federal Reporter," Volume 256, page 660.)

HIGH COURT OF JUSTICE—Chancery Division. Before Mr. Justice Sargant. November 13, 1919.

In the matter of Muir's Patent. Petition for extension. This is a device for absorbing the shock to a vehicle from striking the road, by means of arranging a vacant space around the hub, which is partly filled with balls or rollers or other forms of wood or metal. The hub may be cushioned with rubber or other resilient substance. The invention may do away with the need for pneumatic tires and is now employed on motor omnibuses, motor trucks and on heavy cars, so that solid rubber tires may be fitted instead of pneumatic tires. The Court extended the patent for seven years. ("Supplement, The Illustrated Official Journal [Patents]," London, England, December 17, 1919.)

In re MUTUAL MOTORS Co. Petition of FIRESTONE TIRE & RUBBER Co.—District Court, Eastern Division of Michigan, Southern District, July 22, 1919.

On the Mutual Motors Co. becoming bankrupt, the Firestone Tire & Rubber Co. endeavored to regain tires and other rubber goods that were in the possession of the Mutual Motors Co., claiming that they had been sold on consignment. The Court, Tuttle, J., delivering the opinion, held that the sale was absolute. Petition not granted. ("Federal Reporter," Volume 260, page 341.)

THE METRIC SYSTEM EXPLAINED.

Learn only the units, dollar, meter, liter, gram—dollar, the measure of value; meter, the measure of length; liter, measure of bulk; gram, for weight. You know all about the American dollar. The metric units, meter, liter, gram, are just like dollar, divided decimally and multiplied decimally. If you want to compare metric units with present units, the meter is 10 per cent more than the yard; 500 grams is about 10 per cent more than the pound avoirdupois, the liter is 5 per cent less than the United States liquid quart (13 per cent less than the British liquid quart).

The Spot Crude Rubber Market During 1919.

AS WAS ANNOUNCED in the middle of December, 1918, government restrictions on rubber imports were removed in January and at the same time the armistice began to set ocean transport free so that a decline in prices was to be looked for with the increase in supply. During January, first latex crépe dropped gradually from 58 cents on January 7 to 52 cents on January 27 and ribbed smoked sheet dropped with it from 56 cents to 50 cents, while the price of upriver fine went from 64½ cents down to 58 cents.

Early in February large orders were placed by manufacturers, the demand for plantations was active and it seemed as if prices would go up again. The spurt was followed by a reaction which sent the price down steadily not only to the end of the month, but until the middle of the summer, when, aided by large arrivals, the bottom price of the year, 40 cents, was reached. On February 4 first latex crépe was 58 cents again, as was upriver fine; on February 27 the prices were 55 cents for first latex crépe and 58 cents for upriver fine.

During March the market was stagnant, there was little demand from buyers, and prices continued to go down. The Pará rubbers reached the level of between 55 and 56 cents, at which upriver fine remained for several months, further decline being checked partly by the holding back of rubber exports by Brazilian financial institutions. First latex crépe which was 55 cents on March 4 sold for 51½ cents on March 28 and ribbed smoked sheets kept at one cent below the latex price.

In April the market continued dull, plantation grades declined steadily owing to heavy arrivals and little demand. On April 4 first latex crépe sold for 49 cents. In the middle of the month there was a little animation which sent the price up to 50 cents, but by April 29 it was down again to 48 cents. Some demand for Pará kept the price of upriver fine at 56 cents.

May again was dull for crude rubber, though the price of plantations kept steady owing to oversupply. On May 3, first latex crépe was at 47 cents; it rose to a cent above, sank to half a cent lower, and by May 28 was at 47 cents again. Upriver fine selling for 56 cents at the beginning of May, rose to 58 cents and dropped again to 56½ cents at the close of the month.

The same story of dull markets is true for June, except that the price of plantations dropped sharply; on June 7 first latex crépe sold at 44 cents, by June 28 it was selling at 40 to 41 cents. The Pará prices were kept steady, upriver fine staying at 56 to 56½ cents in New York, while 66 cents was asked for it in Pará.

In July the bottom was reached for plantation rubber, arrivals were heavy, manufacturers would not buy and holders would not sell at the prevailing prices, as they expected Germany to buy heavily, so first latex crépe reached 40 cents and ribbed smoked sheets 38½ cents; by the end of the month, however, prices had started on the upward course in which they were to continue during the rest of the year. July 1 latex crépe sold for 42½ cents, July 31 it had returned to 42 cents. Upriver fine sank also a little with the plantation rubbers, selling for a time at 54½ cents; July 1 it was at 55 cents and also on July 31.

During August the market improved slowly, but steadily; manu-

facturers began to buy and prices were firm, though there was plenty of rubber on hand. August 1 first latex crépe sold for 41½ cents; August 25 it sold for 45½ cents. The Pará market was quiet with upriver fine at 54½ cents at the beginning and close of the month.

With September a remarkable advance began in plantations, which with some breaks, continued to the end of 1920. Manufacturers of tires and of all rubber goods bought heavily and seemed ready to pay any price for the rubber they wanted. While there was speculation, the demand came from consumers. First latex crépe at 45½ cents on August 30 sold for 51½ in the first week and 52½ in the second week of September and was selling for 50½ on September 29. The Brazil market was quiet and in-

active, with upriver fine at 55 cents on September 6 and at 54 cents on September 29.

Throughout October the market continued firm with increasing demand from the factories for plantation, while the Brazilian market was practically dead. During the month the prices of both latex crépe and smoked sheets rose above that of upriver fine. October 3 the price of first latex crépe was 50 cents, on October 31 it was 54 cents; at the same date ribbed smoked sheets

were 53 cents. Upriver fine was quoted at 54 cents on October 3 and at 53 cents on October 31.

The rise in plantations continued till the middle of November, when there came a temporary drop. The demand of the manufacturers fell off and prices were affected also by the drop in sterling exchange. First latex crépe at 54 cents on November 1 rose to 55 cents the next week and then dropped, standing at 52½ cents on November 27. There was a like drop in Pará, upriver fine selling at 53½ cents November 1 and at 51 cents November 27.

The crude rubber market continued steady throughout December, taking a sudden rise for plantations in the last week. The steadiness was attributed in part to the firm handling of the Singapore and London markets, but it was due also to the continued demand. December 2 the price for first latex crépe was 53 cents, December 31 it was 55 cents. It is remarkable that ribbed smoked sheets sold for the same as first latex crépe, 52½ to 53 cents on December 2, and 55 cents on December 31. There was a further drop in Brazilian rubber, upriver fine selling for 49 cents on December 2 and 31, but having sunk to 47½ cents in the interval.

Upriver fine, which sold at 64½ cents at the beginning of January, 1919, had fallen to 49 cents on December 31; first latex crépe sold at 58 cents on January 1, and at 55 cents on December 31, and ribbed smoked sheets at 56 cents on January 1, and 55 cents on December 31.

RUBBER ESTATES IN THE STRAITS SETTLEMENTS, WHICH have depended heretofore wholly on cheap coolie labor, are now considering the use of agricultural machinery, such as tractors and harvesters, because there is a shortage of the labor and a general shortage of rice, the principal food throughout the Far East.

FLUCTUATIONS OF UPRIVER FINE, FIRST LATEX CRÉPE AND SMOKE SHEET RUBBER DURING 1919.

Review of the Crude Rubber Market.

NEW YORK.

THE CRUDE RUBBER MARKET, after declining slightly in the first week of January remained very steady throughout the month, falling off a little at the close. The variations were chiefly speculative, but holders maintained their prices, declining to concede the fraction of a cent asked for by bidders. There is a large stock on hand, but not more than will satisfy the anticipated demand. Plantation rubber still commands a higher price than the best grades of Brazilian.

Prices for plantation and South American rubber at the beginning and toward the end of the month are shown in the following quotations:

PLANTATIONS. January 2, first latex crepe, spot 55½ cents, futures 55½-55¾ cents; January 26, spot 52 cents, futures 53-53½ cents.

January 2, ribbed smoked sheets 55 cents, futures 55-55½ cents; January 26, spot 52 cents, March-June 52½ cents, July-December 53½ cents.

January 2, No. 1, amber crepe, spot 52½-53 cents, futures 53 cents; January 26, spot 52 cents, futures 52½ cents.

January 2, clear thin brown crepe, spot 49 cents, futures 49-49½ cents; January 26, spot 48 cents, futures 48 cents.

January 2, No. 1 roll brown crepe 42 cents to 42½ cents, futures 43 cents; January 26, spot 42 cents, futures 42 cents.

SOUTH AMERICAN PARÁS AND CAUCHO. January 2, spot prices, upriver fine 49½-50 cents, islands fine 48 cents, upriver coarse, 37 cents, islands coarse 24 cents, Cameté coarse 23½-24 cents, cacho ball 35-35½ cents. January 26, upriver fine 47 cents, islands fine 45½ cents, upriver coarse 34½ cents, islands coarse 21 cents, Cameté coarse 23½ cents, Cacho ball 34 cents.

RECLAIMED RUBBER.

The market for reclaimed rubber during January exhibited the renewal of active demand on the part of users of this product to a gratifying extent. In all lines prices are firm at advances over quotations of a month ago, except in the case of white reclaim, which remains steady.

The demand may be described as active for near by deliveries. Future commitments are not markedly in evidence at the present time.

NEW YORK QUOTATIONS.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert E. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"During January there has been a fair demand for paper, mostly from out-of-town banks, and early in the month rates were about 6 per cent for the best rubber names, but at the end of the month buyers wanted 6½ per cent and 6½ per cent on almost everything. It looks as though rates will rule very firm for some time yet."

ANTWERP RUBBER MARKET.

GRISAR & CO., Antwerp, report (December 24, 1919): The market remained quiet during the past week and we close with nearly the same quotations. The stock in Antwerp was about 837 tons. Business in futures is steady with no noticeable change. Prices at closing were from 10.60 to 10.55 francs.

SINGAPORE WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report (December 4, 1919):
In sympathy with London and New York, there was a good demand for all grades at slightly higher values than last week at the auctions which opened Wednesday. Fine pale crepe sold at up to 99½ cents or 3 cents better than last auction. Rubber smoked sheet realized up to \$1 per pound (seven lots sold at \$1.01 and six lots at \$1.00½) or 2½ cents dearer than last week's price.

The lower grades were readily taken up at 2½ cents above last week's figures.

Out of 1,170 tons cataloged 1,077 tons were offered and 770 tons sold.

The following is the course of values:

	In Singapore, per Pound.	Sterling equivalent per Pound in London.
Sheet, fine ribbed smoked.....	96c @ 100c	2/ 5½ @ 2/ 6½
Sheet, good ribbed smoked.....	90 @ 98½	2/ 3½ @ 2/ 5½
Crepe, fine pale.....	95½ @ 99½	2/ 5½ @ 2/ 6¾
Crepe, good pale.....	88 @ 91	2/ 3½ @ 2/ 5½

*Quoted in S. S. currency—\$1 equals \$0.567.

BATAVIA RUBBER MARKET.

HERMANS, MARSMAN & CO., Batavia, report (October 16-November 15, 1919):

The market opened weak, with small demand for prime smoked sheets at 1.34 guilders for spot and 1.36 for forward delivery. During the first week of November the market improved considerably and prices advanced as far as 1.41-1.46 guilders for prime smoked sheets and first pale crepe. The market closed weaker, with quotations 1½ cents lower. Little attention was shown to off-qualities and lower grades. The quotations are:

	In Batavia Per ½ kilo in Guilders.	Equivalent Per ½ kilo in U. S. Currency.
First pale crepe.....	1.43	\$0.572
Prime smoked sheets.....	1.43	0.572

*Quoted per ½ kilo (1.1 pounds) in Dutch Indian guilders (\$0.40).

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official report from Singapore states that the exports of plantation rubber from Straits Settlements ports in the month of November was 13,426 tons as against 8,338 tons in October and 2,661 tons in the corresponding month last year. The total export for eleven months of the current year amounted to 131,216 tons, compared with 57,537 tons in 1918 and 66,589 tons in 1917. Comparative statistics follow:

	1917.	1918.	1919.
January.....	3,462	4,302	14,404
February.....	6,495	2,334	15,661

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE RUBBER SCRAP MARKET has not emerged from the dull state which has characterized it for several months back. Reclaimers have purchased shoe scrap in fair volume at a steady rate. The demand for tires has been mainly confined to stock suitable for rebuilding purposes. The outlet, however, has not been sufficient to prevent the accumulation of a large supply of scrap tires. This situation does not create a pessimistic feeling with the scrap dealers, who look with confidence to the spring demand from the reclaimers.

The heavy snowfalls during the middle weeks of January which were general over the North from the Middle West eastward, have tended to an increased offering of scrap shoes due to the conviction that a sufficient extra crop will result in the spring.

The scrap market is described as soft and prices have recently dropped in sympathy with a decline in crude rubber.

Quotations on shoes are firm, and in general more offerings of scrap are noted.

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

AMERICAN COTTON. Save for a slight flurry in the third week of January, the cotton market remained extraordinarily steady and dull throughout the month as it was in the last half of December, with a daily record of no sales. On January 2 the spot price for middling uplands cotton was 39.25 cents; that price continued unchanged till January 20, save for a slight drop on one day, when it rose to 39.75 cents, sinking to 38.75 cents two days later, and getting back again to 39.25 on January 26.

EGYPTIAN COTTON. The Egyptian crop is very nearly sold and as the demand still continues from England and the Continent the market has been pushed up until today good grades of Sakel are worth about \$1.25 per pound. There are some lots of Uppers in Egypt around \$1.20, but desirable cottons are scarce.

ARIZONA COTTON. This year's crop has now been practically sold but a few low-grade lots can still be purchased at around 90 cents.

SEA ISLAND COTTON. The crop is fairly well cleaned up and average extra choice is quoted at 88 to 90 cents. Crops of all extra staples have proved shorter than anticipated.

DUCKS AND DRILLS. With mills working full time, even though that time has been shortened in many states, it is impossible to meet the overwhelming demand for these goods. The mills are sold up for this year to August, and buyers would be willing to contract for goods for the end of the year if the mills would sell. There is no sign yet of a return to normal conditions. The call for goods needed in the rubber business is especially strong.

RAINCOAT CLOTH. Prices have considerably advanced since last month, but during the past week gray goods have declined about one cent per yard on grades used in the raincoat trade.

TIRE FABRICS. The conditions reported in December continue in January; manufacturers are trying hard to fulfil their contracts, the mills are working overtime and still it is impossible to supply the demand because there is no prospect of being able to deliver the goods.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE GENERAL CONDITION of short supply, on the whole, has not materially changed in most lines. The demand is fully up to the producing capacity for the standard compounding materials, and prices have been advanced in some lines.

The production of lead and zinc in the United States, according to report from governmental sources, experienced a very marked decline in 1919 over the normal output, owing to labor and other controlling conditions.

ANILINE OIL. Spot supplies available are offered at 34 to 36 cents per pound.

BARYTES. During the first half of the month there were no quotations; later, \$23 to \$25 per ton was named.

BENZOL. There are but small spot stocks available, held at 32 cents per gallon.

LITHARGE. Production is sold far ahead with demand very active at an advance of ½ cent per pound effective early in the month.

LITHOPONE. The demand holds very strong, with prices firm at 7¼ to 7½ cents per pound.

NAPHTHA. Early in the month increasing spot stocks indicated a decline in price by February first. At this date spot is quoted at 32 cents per gallon.

SUBLIMED LEAD. Early in January the price advanced to 8½ to 9 cents, the first increase in a considerable time. The demand exceeds the supply. Later in the month sublimed lead was quoted at 8½ to 9 cents.

WHITING. The scarcity of chalk imports has lead to an advance in whitening prices which are very firm.

ZINC OXIDE. The advance which was expected early in the month proved to be ½-cent per pound on all grades. It was attributable to the increased cost of spelter and coöperage.

NEW RUBBER QUOTATIONS.

JANUARY 26, 1920.

Prices subject to change without notice.

THE TROPICAL AGRICULTURIST

and Journal of the Ceylon Agricultural Society

The Tropical Agriculturist (fully illustrated) is now an official publication with special scientific papers in addition to many of its old features.

Edited by R. N. Lyne, F. L. S., F. R. G. S.
Director of Agriculture, Ceylon.

Rubber Cultivation and the Chemistry of Rubber form one of the features of the Journal; full information on Ceylon and Malay Peninsula methods and progress. All about Tea, Coffee, Cocoa, Tobacco, Cinchona, Cinnamon, Fibre Plants, Cocoanuts and other Palms, Citronella, Lemon Grasses, and all tropical products.

Rate of Subscription for America, including postage:

Yearly.....In

The Tropical Agriculturist circulates throughout the Tropics, and is a first class advertising medium.

SUBSCRIPTION: \$3.60 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to **THE INDIA RUBBER PUBLISHING COMPANY**. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**GOODYEAR AND THE HALL OF FAME.**

CHARLES GOODYEAR discovered, invented, created vulcanized rubber. Thus simply stated, the fact seems very commonplace and of no paramount importance. It does not seem comparable with the work of Whitney and the Cotton Gin, Fulton and the Steamboat, Morse and the Telegraph, and others of the Immortals. Yet his accomplishment as far as originality goes far transcends them all. Not that it is intended to minimize the genius of the others or to decry the value of their work. But the case stands thus: Fulton applied an existing well-known principle successfully; Whitney made a machine do what had formerly been done by hand; Morse interpreted and applied known physical laws in electrical transmission. Goodyear on the other hand had no prepared basic knowledge from which to start: no text books contained a line of value; scientists and practical men could offer no assistance. Indeed, the thought that india rubber could be "changed" was to them the height of absurdity. Yet after thousands of experiments, covering years of time, he transferred a sticky, unreliable vegetable resin into a semi-metal that is to-day one of

the world's most useful products. No other single human invention approaches it in strangeness. The transmutation of lead into gold would alone equal it in apparent impossibility.

From his discovery in the early 'forties has sprung an industry that is world-wide in scope. The production of the gum has given work to hundreds of thousands of natives in South America, Africa and Southern India. It has done more to clear up tropical jungles and to bring civilization and sanitation to the hot countries than has any other one industry. The hundreds of factories in the temperate zone, the millions of workmen and the billions of wealth thus created are in themselves a potent witness to the value of the Goodyear discovery.

Fortunately for individual manufacturers but unfortunately as far as general knowledge goes, vulcanization instead of founding one industry, produced nearly a score, all based solely upon vulcanization, but aside from that having little in common. To cite two examples, rubber footwear and insulated wire. They vary widely in machinery, processes, compounds, and markets. Manufacturers of the one commodity may not know that the other exists. And so it is with the rest of the lines of rubber manufacture.

To catalog even the varied products of vulcanized rubber would be an enormous task. Suffice it to say that it is a necessary factor in every industry, touches every profession and indeed every individual.

Hence it is wise and right that the request of Colonel Colt published elsewhere in these columns be endorsed by everyone in the rubber trade, and by every American. Charles Goodyear's name certainly belongs in the Hall of Fame.

AS TO PNEUMATICS FOR TRUCKS.

"AUTOMOTIVE INDUSTRIES" sounded a timely note of warning recently in an article entitled "Pneumatic Figures Needed," thus:

There is great need for authentic figures on pneumatic truck tire costs in different services. The claims made by different manufacturers vary widely. This is natural when it is considered that the figures are compiled from services operating under widely varying circumstances. The time has come, however, when definite conclusions should be drawn.

One manufacturer claims that on a ton-mile basis, the pneumatic will save 25 per cent on gasoline, 32 per cent on oil and 70 per cent on repairs. These figures were deduced from observations of trucks in service in Texas. It would be interesting to know how this checks with experiences in other parts of the country and some more or less concerted effort for getting down to hard facts on the pneumatic tire will be necessary before we have a clearly established idea of where they pay and where their serviceability is problematical.

It is very doubtful if the size of the truck has much to do with the matter, although there is doubtless a limit of truck size for which pneumatics are desirable. It is felt by many truck makers that the 1 to 1½-ton size should be practically universally equipped with pneumatics, and the 3½-ton size and over, rarely, if ever. It

is the sizes in between those from 1½ to 3½ tons capacity, which furnish the ground for debate. It is here that the purchaser must carefully weigh the conditions under which he will operate his trucks and make the decision. To help him reach his decision the manufacturer should equip his sales force with a mass of figures covering all phases of transportation, or the purchaser will be left very much at sea on a most important problem.

Furthermore, the matter is of the utmost importance to the truck manufacturer, because it will affect his design. If a large percentage of the trucks between 1½ and 3 tons capacity will require pneumatics, it is evident that new designs are required immediately, as tire manufacturers and others assert that there are few if any trucks in that capacity range really adapted to pneumatics.

The problem of design of a pneumatic-tired truck is altogether different from that of designing a vehicle for solids. Higher engine speeds and different gear reductions are necessary for these fleet freight carriers which are capable of 30 miles an hour and move across the relatively uninhabited sections of the country. It is with these vehicles that the ship-by-truck movement has been made a reality and considering the characteristics demanded of the truck the design reverts back very closely to passenger car practice in engine speeds and gear ratios.

A true picture of the situation will not be gained until we have complete statistics regarding costs in all the standard lines of transportation in which the trucks in the debatable class, between 1½ and 3½ tons, are used, and until recommendations made on the basis of observations of trucks in operation show what changes are desirable with the pneumatics. The invention of new rim types for the easy removal and replacement of the giant pneumatic, is a big step in rendering the large pneumatic truck more serviceable, but a collection of unbiased cost, speed and efficiency figures is needed to help the bewildered purchaser reach a positive conclusion before he selects his truck.

RUBBER RAINBOWS.

ACCORDING TO STATISTICIANS, ninety-nine and eight-tenths of those who own a few dollars are unable to retain them. They are rainbow chasers: gold, copper, oil, rubber, anything that sounds big. Just now it is rubber. New companies are floated overnight, or, a small company gets a letter of this sort:

"The smaller companies cannot compete with the big ones. Why? Lack of capital. I can dispose of any amount of stock you may have to sell in thirty to ninety days. Please communicate at once," etc., etc.

Accompanying this is a chart headed, "Do you want \$423,000 for \$1,000," with the following figures:

Goodrich, original investment of \$1,000, is worth \$696,000.

Firestone, original investment of \$1,000, is worth \$150,000.

This of course is for the prospective investor, and it is unfortunately very effective.

Of course it is all true enough, that is, as far as the big companies named are concerned. It, however, does not take into consideration the long years of preparatory work before the original thousand was anything but a loss. No word of warning is given as to the necessity

for building a solid foundation for the projected colossus. Nothing is hinted as to the need of experienced and brilliant managers, organizers and financiers. Nor does it enter into the head of the investor that the big boom is over, and from now on it is to be the steady grind of every-day, careful, cheese-paring business, with constantly decreasing profits. Not that the rubber business will not continue to grow and prosper. It will. But mushroom companies, no matter what their capitalization, are almost sure to come to grief, for the promoter is not trying for success, but simply for his commissions.

RUBBER LEADERS ON INDUSTRIAL RELATIONS.

THE INDUSTRIAL COMMITTEE of the Merchants' Association of New York of which Frederic G. Achelis of the American Hard Rubber Co., J. Newton Gunn, president of the United States Tire Co., and other rubber men are members, formulates the following excellent advice: "The recognition by both employers and employees that the determination to achieve national prosperity rather than to enforce maximum selfish returns, should be the controlling motive in industry. The community, as such, has a right to insist that industry be carried on in the interest of all citizens rather than for the sole benefit of those directly engaged in it. The permanent welfare of all citizens depends on national prosperity which is impossible unless there is maximum production at minimum 'per unit' cost without impairment either of proper living standards of employees or the ability of the employers to earn a reasonable return on their investment."

It is urged that a permanent method of conference between the employer and his employees be recognized with a definite arrangement—satisfactory to both employers and employees—whereby employees can collectively take up disputes or matters of common interest with employers. The following matters, it is declared, should be handled in such conferences: "Wages and working conditions including steps to promote continuous and permanent employment, especially in the case of introduction of new machinery and new processes; plant conditions affecting health and general welfare of the workers." A fair day's wage and continuous employment are urged as essentials to a harmonious understanding.

THE OLD-TIME MILL SETTLEMENT WAS AN AGGREGATION of barrack-tenements, squalid half-cottages and big jail-like factories. The factory village of to-day is made up of pleasant houses, gardens, parks, recreation grounds, club houses, hospitals, libraries, and factories where light, comfort, and health are prime requisites. Indeed, a new industrial project to-day begins with homes for the workers. In all of this transformation, the rubber trade has been a pioneer. It is claimed, furthermore, that no industry can show as large a proportion of well-to-do workers who own their homes. This in itself is the best possible insurance against unrest, strikes and soviets.

Charles Goodyear Nominated for the Hall of Fame.

AN EFFORT to secure a place in the Hall of Fame for Charles Goodyear will be made this year by leading figures in the rubber world. Elections take place every five years and 1920 is one of the years for making selections. Colonel Samuel P. Colt has already inaugurated a movement to bring the qualifications of Charles Goodyear to the attention of the one hundred electors who will vote on candidates, and as a first step, has written a letter of formal nomination to Robert Underwood Johnson, director of the Hall of Fame. In his letter Colonel Colt says:

"I wish to strongly urge the name of Charles Goodyear, the inventor of vulcanization of rubber. When we think of the many uses to which rubber is now put, adding greatly to the comfort of mankind, the alleviation of suffering, and the advancement of civilization, we are impressed with the fact that the world owes Charles Goodyear a debt of gratitude that can never be paid.

"All the improvements in the manufacture of rubber goods in general are based wholly upon Charles Goodyear's discovery of vulcanization—without air-brake hose, railway trains could not be properly run, without rubber tires we could not have automobiles or auto trucks and without rubber appliances we could not have the telephone, electric lights, airplanes nor the thousand and one other things in which rubber plays an important part.

"Of the eight rubber companies originally licensed under the patents of Charles Goodyear, three have gone out of business and the other five are now owned by the United States Rubber Co., which gives us a special interest in the great inventor."

The claims of Charles Goodyear have been brought to the attention of electors at past elections in an unostentatious way, but rubber had not attained, even so late as the last election in 1915, the place of importance in American business it holds to-day. In 1914 the total production of rubber goods in the United States amounted to only \$320,000,000. In 1918 the output was \$1,122,000,000, nearly four times as great.

Goodyear's discovery of the vulcanization process is one of the romances of the history of invention. One of the reasons why he is especially entitled to recognition is that he understood clearly the importance of the results he was seeking to

attain, and though by a mere accident he finally discovered the solution of his problem, it was not accidental that it was he who found the solution, for he had devoted his entire energy to the subject for years.

With a prescience that was uncanny, he forecast for rubber a future that even the development of the rubber industry in the past few years has not surpassed. He knew little about the electrical field, it is true, and nothing whatever about automobiles, yet his claims for patents made in the early forties show a vision for the future of rubber that was startlingly clear.

A man of strong religious tendencies, he felt himself under a divine impulse to carry to success experiments which would confer so great a boon on humanity. It was this feeling that led him, in spite of most precarious health and dire poverty, to continue for ten years his search for the elusive secret of how rubber might be made suitable for use.

As his experiments progressed, he not only manufactured rubber goods but even dressed in clothes made of rubber, wearing them for the purpose of testing their durability. He was certainly an odd figure and his appearance led one of his friends, who was asked how Mr. Goodyear might be recognized, to reply: "If you see a man with an india rubber coat on, india rubber shoes, an india rubber cap, and in his pocket an india rubber purse with not a cent in it, that is Goodyear."

His poverty was so extreme that many times only the kindness of friends and neighbors kept his large family from starvation. At that period imprisonment for debt was in vogue and on many occasions Goodyear found himself locked up for debt. He was regarded as a "crazy inventor," and, as time after time his hope that he had finally hit upon a solution of his problem proved illusory, his friends and relatives did not hesitate to tell him with much harshness that he should give up his experiments and find some means of supporting his family. But he persisted until he won complete success and then, instead of settling back and reaping a harvest from his discoveries, continued to spend the money that came to him, in adapting his discoveries to practical uses.

Though born in New Haven, Connecticut, Goodyear spent

(From an oil portrait.)

CHARLES GOODYEAR.

much time in New York City and in various towns in Massachusetts. It was in Woburn in the latter state, when some rubber fell accidentally from his hand upon the top of a red hot stove, that he learned that the application of heat was the one additional element needed in the solution of the problem. So intimate was his acquaintance with his subject that the change produced in the rubber by its unexpected contact with the stove was recognized by him as of vital importance.

Large sums of money had been invested and lost in rubber manufacture before Goodyear brought his process to completion. Goods that looked all right were made up, but cold weather made them stiff and brittle, and in summer they be-

came soft, and decomposition gave them an offensive odor.

Goodyear was born December 29, 1800. In 1834 he began his rubber experiments but it was not until the spring of 1839 that the stove incident occurred. His process was not fully perfected until 1844. He received the grand medal of the World's Exhibition at Paris, the Great Council medal of the Exhibition of All Nations at London, and the ribbon of the Legion of Honor from Napoleon III. He died at the old Fifth Avenue Hotel in New York in July, 1860. Death found him insolvent and his family heavily in debt. Though he made no fortune for himself, great wealth has come to many through his invention.

Seeing the Short Cuts.

By A Practical Man.

THERE is not one man in fifty who is either a trained or a natural observer. Moreover, the notion that observation comes naturally, like mastication or perspiration, is far from the truth. Some lack that quality of mind that constitutes the chief asset of the job analyst, while most men look but do not see. A great number are so close to their work that they lose the perspective. This explains in part the fact that the industrial engineer finds plenty of occupation for the ability required in his profession. The instances that follow came under the personal observation of the writer and tell of those who were convinced of a blind spot, and proceeded to cure it, much to their individual benefit and the credit of the rubber fraternity.

CONVEYOR CHUTES SAVE TIME.

A company in the Middle West engaged in the manufacture of bicycle tires employed a truck to gather the packages put up by the packers. This truck was pushed down a long aisle behind the men engaged in this work, where it gathered a load which was carried to the elevator located in the extreme end of the room; thence down one floor to the shipping department. This trucking was eliminated by cutting a hole in the floor about midway in the packing line and installing a chute, which delivered the packed goods by rapid transit.

A manufacturer of fabric shoes in the East, after inspecting the tops as they came from the sewing machines, paired them and placed them in small bags, which were then loaded upon a truck and delivered by the elevator to the next department, which happened to be immediately underneath. Here the bags were opened and the contents distributed. A chute from the inspection table to the floor below would have saved a lot of this work, and given almost instantaneous delivery.

An old and successful Eastern company had its mill room and calender rooms on one side of the lower floor, but with the engine room in between. To supply the calenders with material necessitated frequent trips by truck from the mill room. This trip was an irregular one, winding its way through several departments, by aisles always more or less congested, and by the time a round trip had been made the truck had traveled a distance of 760 feet. This trip was cut down to about 150 feet round-trip in the following way. A window in the mill room nearest the engine room was enlarged into a doorway, and a corresponding change made in the calender room. These two doors, therefore, opened to the outside, and in line with one another. A covered passage was then constructed connecting them, and better and quicker service at once resulted.

Another company had a battery of insulating machines on the second floor immediately over the calenders from which it received the supply of mixed stock. This particular process resulted in the rapid accumulation of large quantities of scrap, which was frequently returned by trucks to the calender room

for rewarming, recalendering and return. A load of this scrap left the machines on a trip of 200 feet to the elevator, down the elevator 12 feet, thence to the warmers for the calenders, 200 feet more. This trip of 412 feet was cut out by the simple introduction of a chute from the vicinity of the insulating machines to the warming mills immediately underneath.

A trip of over 1,600 feet for a batch of Pará from the rubber cellar to the mixing mills would seem, with one company at least, a denial that "time is money." But such a situation came under the observation of the writer some years ago. From the point where the rubber was stored to the scales in the compound room where it was weighed, was 678 feet. The round-trip, therefore, for the trucker was 1,356 feet. From the scales to the breaking down mills was 140 feet, and from these mills back over the same track to the band saw where the rubber was cut and weighed into batches, was 140 feet more. Here it connected with the prepared compound and took a final trip of 50 feet to the mixers. It is a singular fact that directly under the compound room there was a cellar that could have been adapted to rubber storage and cut the initial round trip from 1,356 to less than 50 feet.

WORN MACHINERY A HINDRANCE.

Manufacturers of shoes find a machine for inserting eyelets a necessity. These machines are ingenious and complicated in the arrangement of parts. They are designed to insert any number of eyelets consecutively, the standard ranging from 4 to 11. The operator must have a thorough knowledge of the machine and the requirements in eyelets for each style and size of shoe. These eyelets must be so placed as to start at a point determined by the eye and be equally spaced over the limited surface allowed for the purpose. This spacing is designed to be controlled by a movable steel pin which engages in holes in a disk on which are stamped figures, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, 1, etc. The pin inserted in any one of these should adjust the mechanism so that eyelets would be spaced the indicated distance apart. It chanced, however, in one factory, that none of the machines studied would perform the work according to specifications. The operators knew of no rule to govern the spacing and frequently lost time in trying to secure it. Conversation with the man who looked after these machines revealed the cause to be a worn out cam, which prevented proper alignment of the eyelets. The insertion of a new cam made the use of the pin and disk dependable.

UTILIZING SPACE.

A company engaged in the manufacture of mechanical goods had a commodious, well-lighted room around the sides of which 4-plate hydraulic presses were located. The center of this space, 15 by 20 feet, was occupied by stock and tables on which were placed the vulcanized articles consisting largely of valves, heels, horse-shoe pads, etc. For years these had been gathered

in box trucks and toted to an adjoining room 75 feet distant, where they were trimmed by girls and inspected. This totting was obviously waste motion and was corrected by building in front of the battery of presses, benches arranged in the form of a square, the interior of which was immediately occupied by the trimmers and their equipment.

SYSTEM IN MILLING RUBBER.

There is a variety of practice in breaking down rubber and mixing compounds. In some lines of manufacture five or six hours is not regarded as excessive to break down Pará, while in other very divergent methods, considerably less than one hour is considered sufficient. Then, apparently of necessity, some compounded batches require a much longer time for mixing than others. Time on the mill is often a point in dispute, and there should be some intelligent method to control it. If you are convinced that the same mill should be used for warming up rubber and mixing, the chances are you are not very keen over a few extra minutes that may be taken by workmen who are not controlled by written standard practice.

A very satisfactory method will be followed in the use of two mills by one man who warms up gum on one while mixing a batch on the other. A mill, say 16 by 42, with a speed of 14 and 18 r.p.m. can mix a compounded batch of 100 to 125 pounds in five or six minutes. This would necessitate, probably, a mill equipped with a mixing apron, for the value of such an attachment can be easily demonstrated. Under this method, five or six minutes is sufficient time to incorporate the compound in the rubber, and the batch should be immediately cut off the mill. This commonplace act of cutting-off can be made a time-waster, for the number of cuts should be a matter of standard. For example, one stroke of the knife across the face of the roll and the batch drops from the mill—a matter of seconds—but the average mill hand will take off a batch of this size in six or more cuts. In many cases batches go from the mixer to the refiner, or ready for the cooling shelves. In either case, the batch should not be rolled up as it is cut from the mill, but should be handled in slab form, the point of value being to get the finished batch off and a new one on, with the fewest motions possible. It is clear that the operations of refining and warming up are really continuations of the process of mixing, hence saving time on rough mixing is good practice.

A SECOND FLOOR FOR STORAGE.

In many rubber factories the compounding room has a minimum of equipment and maximum of discomfort, and good ventilation is not one of its virtues. As a rule, it is on the main factory floor near the mill room and looks like Satan's back yard. Materials are handled in the original package and the space is cluttered with boxes, barrels, casks, carboys and bags. Labor-saving devices get paralysis before crossing the threshold, and the superintendent who is indifferent to such a condition must have a well-developed blind spot. Taking into account the real efficiency of the average man when provided with proper equipment to handle a job, it is singular that anyone should apparently fail to see the waste of time when a man has to dig up things out of barrels and casks, the work steadily taking longer and becoming physically harder the deeper he goes into a container that must of necessity be emptied. Just because this material is in bulk and heavy is no reason why it should not be handled efficiently. There is at least one way in which this can be done, namely, to introduce the use of chutes or conveyors. This means a second floor for storage of compounds, and extending to the floor below, a chute for each ingredient, whence the quantities required can be drawn and weighed. With storage room equipped for handling bulk packages by power, the filling of chutes, which should have capacity from a barrel to a ton, would be a simple matter. If any compounds require drying or sifting, apparatus for this purpose should be provided on the second floor. This method accomplishes two

things. It clears the air on the main floor of dust and permits weighing of materials with rapidity. Where, under the old way, "comp" had to be laboriously shoveled from barrels and taken to the scale, in the new way the scale and weighing hopper, moved on a track are run underneath the chutes which are opened as required.

EXPERT WORKERS.

Industrial engineers have always advocated training a workman so that he could perform his task in the most efficient way. This is not always done, with the inevitable result of lowering the quality of performance throughout the shop. The best factories are those that maintain a high standard of excellence, and if a man wishes permanent employment he is compelled to answer affirmatively the question, "Are you a high-class man?" There are some machines used in rubber manufacture that call for a high degree of skill. Those used for cutting out soles for footwear are in this class. It is an easy machine to operate, a light pressure and removal of the foot starting and stopping it. But the job calls for a nice adjustment of the man to the machine, a sort of nervo-physical balance. It is one thing to have a man operate this machine as though he were shoving pig-iron into a furnace, and another to have a man who has a hair-trigger control of every muscle and pushes the rubber slab and cut soles in rhythmic sequence with the rhythm of the machine. The results are readily discernible. The man who thinks of pig-iron when handling a rubber slab across the cutting plate and tries to break through the floor when he presses the treadle cuts 1,800 to 2,500 soles; the other type of man 3,500 to 5,000. Take each of these men at his minimum as an average and you have for 30 days 54,000 and 105,000 respectively.

One way to make a man an expert workman is to impress him with the importance of maximum production. If he is operating a sole-cutting machine and he has to stop it to sharpen a knife or adjust an ill-fitting part or to get stock or wait for his helper, he will soon get a wrong slant at the main idea. It is a losing proposition that works both ways.

THE FOREMAN SHOULD BE CENTRALLY LOCATED.

In the layout and equipment of a factory department the location of the foreman's office, as a rule, receives scant attention, with the result that it is frequently located at one end of the room farthest removed from the larger number of workmen. In one case, in the milling department of a rubber factory, one corner of the room was used for putting up compounding materials. This room was walled in to prevent the spread of dust and a portion of it, a space 3 by 10 feet against a window, was used by the foreman as his office for the clerical work he had to do. There were in this department 40 mixing mills, a calendar, four washers and large drying rooms, so it was sizable enough to require constant supervision. The point I wish to make is, that the foreman's office or desk should be so located that his men will be under his eye at all times. When this principle was emphasized to the superintendent of the mill in question, his eyes were opened to the desirability of having a change made. Opening out of the mill room about midway in its length was a small store room. A section of the wall between was removed and windows substituted in the form of a bay projecting slightly into the mill room. The floor of the new office was placed three feet above the mill room level, and from this point of vantage all operations were under constant observation.

This same factory had its vulcanizers on the ground floor. The bulk of its product was produced on the second floor and had to be lowered by an elevator for curing, and hoisted afterward for inspecting and finishing. This extravagant waste of time and travel had been going on for years, the management being apparently "stone blind" to the loss incurred. A new superintendent caused the vulcanizers to be raised to the level of the second floor.

The Rapid Rise in the Cost of Equipment—An Important Factor in Rubber Production Cost Accounting.

By J. H. Meyer-Schmidt, Consulting Economist.

THE RECENT INCREASES in the cost of all industrial equipment is bound to play an important part in the cost accounting policies of our rubber factories during the present year, and others to come. There is hardly a unit of equipment that has not been touched by this rise. Industrial machinery has gone up at the rate of one to two hundred per cent, building expenditures are up at least 150 per cent, and the great range of industrial supplementary equipment, part of which is a product of the rubber industry as belting, has seen advances of at least 100 per cent during the last few years. These advances in the cost of equipment, although well known to all manufacturers in the rubber industry, nevertheless seem not to have made a permanent impression upon the minds of the financial experts of this industry. Hardly any precautions have been undertaken to meet the situation and the majority of rubber factories are still estimating manufacturing cost upon a basis of machine depreciation much below that which is required by actual conditions. The loss naturally falls upon the shoulders of the rubber industry. But, in addition, there is the very real danger of the industry weakening its financial position in such manner as to court unavoidable disaster if steps are not taken to correct the situation.

EXISTING CONDITIONS.

The condition as existing to-day is best explained by an assumed example of a rubber factory having a machinery equipment costing \$200,000 during the year 1914. If this factory is operated upon the general practice of charging 8 per cent to the depreciation fund every year, it has to add to its annual manufacturing expenditure \$16,000, which amount would have to be set aside for purpose of renewing the equipment after it has become unsuitable for the purposes of the enterprise. Experience has shown this policy a very sound one in normal times, and allowing 10 years' life to the machinery equipment, a provision of 8 per cent for depreciation would amply cover this factory against loss from this account. It is, therefore, employed without any criticism, and no fault could be found as long as depreciation really proceeded at the rate of 8 per cent and also as long as the price of the equipment remains approximately the same. Both essential conditions for the safe operation of the 8 per cent equal depreciation rule do not work to-day.

The war has changed the fundamental industrial conditions and the rubber factory under consideration has, most likely, not only experienced a more rapid rate of equipment depreciation than that indicated by a depreciation charge of 8 per cent, but it also can not hope by any means to purchase its equip-

ment at the end of the customary ten years—the year 1924—at the same purchase price of 1914. It is fairly certain that the equipment in question will lose its manufacturing effectiveness considerably earlier and that it will cost approximately \$400,000 to replace it when this time has come. This factory then has to show at the best only a repurchase fund of \$200,000 allowing for accumulated interest of investment, and it will have to find additional funds to put the factory back upon the same basis of efficiency that it had during 1914. The factory has lost a matter of \$200,000 in ten years of operation or \$20,000 per annum. Incidentally, it has also charged \$20,000 every year below its actual manufacturing cost.

Such a loss would be a heavy one in any industry; it is, however, especially dangerous in the case of the rubber industry where competition is

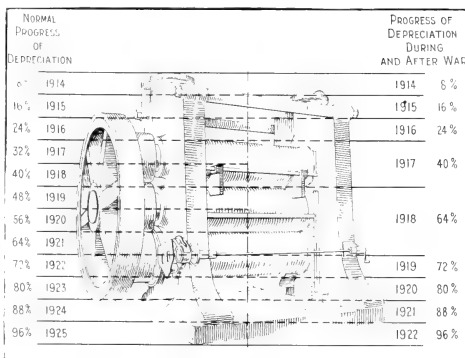

very active and where in consequence there is a strong tendency of shading prices. During the war, of course, considerable profits have been made by many rubber factories, but it is doubtful whether a sufficient amount of these profits has been set aside for reserves above the usual depreciation fund in every instance. The chances in fact are that profits have been divided more lavishly than usual, considering the need of the shareholder for larger earnings in view of the high cost of living and the general increasing personal expenditure.

The danger now is that the rubber factories will

the other extreme and after having made big profits for a few years will try to cut their profits lower than it is safe for the profitable operation of their enterprises, in an endeavor to meet growing competition and a possible decline in the volume of orders. With such a possibility in view, it is essential that the industry should know its working cost to the fraction of a cent and that no miscalculation should be made, as might easily occur if the present practice of charging depreciation cost is continued.

A CHANGE OF ATTITUDE RECOMMENDED.

A new method of charging depreciation, therefore, seems to be urgently required. Such a method to be really useful must not be too complicated, and it must fit every condition so that it can be employed uniformly. The principle in the development of such a method must be a complete change in the attitude of our accountants and factory owners with respect to the depreciation factor in the annual account sheet. The general feeling towards the depreciation charge is to-day one of gentle leniency. To charge depreciation upon equipment permits the factory to make less profits in the eye of the taxation officer; incidentally, the slow writing off of the equipment provides the

Have You Provided for the Accelerated Depreciation of Machinery Equipment Caused by Forced Employment During the War?

accountant with the pleasant feeling that he really strengthens the financial position of his firm. Having followed a safe course for so many years, there is little reason to suspect its unsoundness until actual disaster overcomes the enterprise. The process of attrition proceeds slowly; the danger as a rule is not noticed until it is too late to make amends, and the firm simply goes to sleep as so many others do, after having run through an apparently prosperous existence of 15 to 18 years, the time that is required to make the equipment industrially uncompetitive.

Substitute for the word depreciation the word replacement, and an entirely new atmosphere is created. The words replacement fund do not only suggest the recording of the progress of loss of effectiveness in machine depreciation as a matter of routine, but replaces it by an actual payment from the profits of the enterprise as an offset against this loss. A purely theoretical problem becomes suddenly very much alive. Depreciation and loss of effectiveness become tangible meanings, and while opinions may differ about the amount that will have to be written off, it will give the factory its full safety for continued prosperity. Further, if the money is taken actually from the profits there is *prima facie* evidence of the annual cost of depreciation to the factory, and the influence of the depreciation charge upon manufacturing cost is not so easily overlooked. The equipment replacement fund becomes a very effective safety valve, protecting the factory not only against slow depreciation, but giving it the means for making occasional equipment improvements.

A number of systems have been proposed to make the depreciation charge more fitting to actual conditions and to bring the depreciation factor into more immediate bearing upon the cost estimating policy of the firm. The following system may appeal to most rubber manufacturers because it can be easily employed over a great variety of equipment, and because it can easily be used for the purpose of checking depreciation cost in the different subdivisions of a large manufacturing concern. The system is based upon the principle of making the depreciation charge upon the rate of actual employment, and to charge upon the real replacement value of the equipment.

HOW THE METHOD SHOULD BE EMPLOYED.

To explain the system it may be best to return again to the original example of a rubber factory with a machinery equipment costing \$200,000 during the year 1914. The year 1917 may be used for the purposes of demonstrating the method. This year belonged to the most strenuous years in the war history of the rubber industry. It required an enormous expansion of all production in support of the army equipment industries, and most factories worked overtime all through the year. It does not matter here what the actual rate of employment of our factories was. We may assume, however, that the factory under consideration has worked with three shifts during the second six months of the year, having worked upon a normal production of eight hours during the first half only. Assuming that experience has shown the rate of 8 per cent as approximately correct for the purpose of making a depreciation charge

under normal occupation of the equipment, it must be taken for granted that for the first half-year depreciation has normally developed upon the indicated level. From the beginning of July, however, the factory has changed its working policy. It has worked 24 hours a day and equipment has been in use, not the customary eight hours, but three times that period. Depreciation, therefore, has proceeded not at the rate of 8 per cent per day, but at 24 per cent. Loss of industrial effectiveness of the equipment under such conditions would not have been reached after ten years, approximately, but at a time slightly over three years and four months. In fact the equipment would have required renewal during the present year, allowing for a normal depreciation during the years 1914 to 1917. The depreciation of the equipment in this factory, therefore, proceeded at an average of 16 per cent for the whole year, and was less effective industrially than the preceding year when the time came for drawing the annual balance.

Having established in this way the factor of depreciation, it is necessary to inquire into the value of the equipment to the factory. If the works had burned down suddenly or otherwise been destroyed, by the end of 1917 the equipment could not have been replaced for the \$200,000 at which it stood on

the books: \$300,000 at least would have been needed for that purpose. This also would have been the amount obtained by making a complete valuation of all the equipment of the factory at the existing replacement value. The cost of depreciation of equipment in that factory, therefore, was during the year 1917 as follows:

Six months employment of equipment at 8 hours a day.

Rate of depreciation, 8 per cent.

Six months employment of equipment at 24 hours a day.

Rate of depreciation, 24 per cent.

Average annual depreciation of equipment, 16 per cent.

Replacement cost of equipment to date, \$300,000.

Total charge to depreciation cost, \$48,000.

The annual charge under the old method would have been \$16,000, a loss to the factory of \$32,000 in operation cost, if not taken care of in the charge to manufacturing cost.

SHOWING ADVANTAGE OF NEW METHOD.

But the proof of the pudding is in the eating. Does this system really guard a factory against both the increasing speed of depreciation incurred by increased production and also against the increasing price of the equipment? Let us suppose that equipment prices would have remained approximately the same at the end of 1918 and that this factory also has continued to work at the rate of 24 hours during 1918, with the certainty of having to replace its total equipment somewhere near the end of 1920. We would then have the years 1914, 1915 and 1916 as normal years, with equipment prices remaining approximately at the level of 1914 and employment at 8 hours per day. During three years the factory would then have charged a level 8 per cent of depreciation, and it would have had in hand a repurchase fund of \$48,000 plus interest and an equipment still worth approximately seven years' effective employment. The next year 1917 would have added \$48,000 to the fund, while 1918 would provide \$72,000. By the end of 1918 two years of effectiveness might still be left, and dur-

ing these years \$48,000 would have been added to the repurchase fund, assuming in this instance that further increases in the price of the equipment would not have made necessary additional provision for depreciation.

Allowing for accumulated interest from the investment of the annual addition to the repurchase fund, a total amount of \$270,000 would then be on hand at the end of 1920. This is still \$30,000 short of the actual value of the equipment, but it must be taken into consideration that this equipment has still some value which makes it a marketable property and \$30,000 may easily be obtained by selling such equipment, unless the factory decides to use it a few years more on work where less effectiveness and precision is required. Another five years of employment in secondary manufacturing processes probably would make the equipment obsolete for use in high-class manufacturing, and its sale then would become a necessity. In the meantime, however, its value would have been wiped off completely from the balance sheet of the enterprise, as only another year and a quarter would be required to provide for the additional \$30,000.

INFLUENCE UPON COST OF PRODUCTION.

Mention already has been made several times of the effect of such a policy upon the cost accounting practice of a rubber factory. It is obvious that the former policy of charging depreciation upon the original investment on a basis of an equal depreciation rate is giving a wrong impression of the actual cost of the equipment upon manufacturing cost. There is considerable difference if a charge sheet is made upon an overhead charge of \$16,000 for machinery depreciation or upon one of \$24,000 for instance. But the higher charge is not only justified by conditions but also by the urgent necessity of the present price situation.

All manufacturing, after all, is service rendered in the interest of the buyer. That the manufacturer buys to-day the raw materials and also takes care of the distribution of the article that is manufactured in his plant, does not alter anything in this very fundamental rule of cost accounting. If this manufacturer employs expensive tools in serving his trade the customer must pay his share of the wear and tear of the tools or he must seek out another manufacturer having a less expensive equipment. Let the wear and tear proceed at a quicker pace than normally accepted while the work is done for the customer, and it is only just that the customer also should stand for the increased rate of use. On the other hand, however, three times the rate of the employment also means, most likely, three times the quantity of goods. The increased rate of wear and tear, therefore, spreads over a larger production, and the relative share of each unit of production upon the increased wear and tear of the equipment remains practically the same. This, however, does not apply in the same manner to the increased cost of the equipment. If to replace the unit of equipment costs double what it cost to buy in the past, this increase doubles also in its relationship to each unit of production. Assuming, therefore, a factory employs its equipment at three times the rate of normal, producing also three times as much goods while the equipment price remains the same, there would also be no increase in the cost of manufacture of the individual unit of production. If the cost of the equipment, however, would be double the cost of manufacture of the individual unit of production, its cost will increase at exactly its share of the increased cost of purchasing the equipment.

This is a rule that rubber manufacturers will have to keep in mind when making up their cost charges during the future. Its application will be made more easy if they follow the practice of charging depreciation costs as outlined in this article. With the help of the time books it will be possible to allocate depreciation cost quite correctly to each article manufactured

in the factory, whether the process of manufacturing is carried on in one or in several departments.

PRODUCTION, NOT SELLING, IS THE PROBLEM.

By Colonel Samuel P. Colt.

THE OUTLOOK for the year 1920 in the rubber industry is most flattering. To-day the demand for all lines of rubber goods exceeds the supply. It is not a question of selling goods. It is a question of producing them. In other words, if we could turn out 50 per cent more production than we are able to do with our present manufacturing facilities, the entire output would be disposed of without difficulty. The year 1919 has been the banner year in the rubber manufacturing business. At the time of the armistice it was our opinion that with the virtual closing of the great war and the stopping of government orders there would necessarily be a falling off in the volume of sales of rubber goods, but such has not proved to be the case.

While all lines of rubber goods, such as footwear, mechanical goods, druggists' sundries, etc., show an increase, the most marked development has been in the tire industry. The large tire manufacturers have been unable to supply the demand for tires the past year. In 1914 there were registered in this country 1,574,433 automobiles, and 136,907 automobile trucks. It is now estimated that there are in use 6,800,000 automobiles and 800,000 automobile trucks—a remarkable increase.

When the question is asked, "What is the matter with our trolleys?" I would reply that the fundamental difficulty is the encroachment thereon of the automobile and the automobile truck, and with the improvement and development of our highways, I can see no room for trolley lines along sparsely populated sections. My opinion is that the tracks of many suburban trolley lines will eventually be taken up. Therefore, while the development of the rubber tire has been tremendous during the past five years, there is every reason to believe that it is to-day, comparatively speaking, in its infancy. The effect of the development of the pneumatic tire upon both passenger and freight traffic, or in other words upon our railroads, has, I am convinced, not yet been realized.

The price of crude rubber has been normal during the year, having averaged about 45 cents per pound. It is estimated that 70 per cent of the crude rubber consumption of the world in 1919 was by American manufacturers. With the opening up of Europe, one might look for some increase there, but I would predict that the United States will continue to consume more than half the world's crude rubber product for years to come. We plainly lead the world in rubber manufacturing. Prices of fabrics entering into tires and other rubber goods have ranged higher in 1919 than ever before, the indications being that we have not yet seen the limit of high prices.

The development of plantation rubber in the East has continued unabated. It is most fortunate for the rubber industry that the cultivation of the rubber tree in the vast regions of the East proved practicable, for had we to depend upon the wild rubber of Brazil and other sections, the supply would be so inadequate and the price so exorbitant that it is difficult to see how the tire industry could have reached its present stage of development, to say nothing of the future.

It is plainly evident that the result of the phenomenal depreciation in foreign exchange has been to curtail American exports. However, with the opening up of Europe our rubber export trade has increased to such an extent that it is now larger in volume than before the war. Moreover, with a permanent change for the better in the foreign exchange situation, which is expected to follow the ratification of the peace treaty, it is only reasonable to assume that our European trade in rubber goods will assume proportions of greater magnitude than heretofore known.

Standard American Export Practice.

AS THE CERTAIN MEANS of insuring unmistakable clarity in terms and conditions of sale, nine of the greatest commercial organizations of the United States interested in foreign trade have in conference adopted a simplified standard American export practice that should greatly facilitate and promote the foreign business of this country. The organizations party to the program are the National Foreign Trade Council, Chamber of Commerce of the United States of America, National Association of Manufacturers, American Manufacturers' Export Association, Philadelphia Commercial Museum, American Exporters' and Importers' Association, Chamber of Commerce of the State of New York, New York Produce Exchange and New York Merchants' Association. The program itself consists of a statement of definitions of the abbreviated forms of price quotations in more or less common and general use in the export trade, which manufacturers and exporters are urged to use habitually as far as possible to the exclusion of other forms synonymous or otherwise; also the recommendation that all use of abbreviated forms be abandoned and that the terms be written out in full.

Manufacturers and exporters are urged to bear in mind that the confusion and controversies which have arisen in American export trade have sprung in part from the use of an excessive number of abbreviated forms with substantially similar meanings, as well as from the use of abbreviations in a sense different from their original meanings, or in an application not originally given them and different from the sense or application understood by foreign buyers. In the simplified and standardized practice agreed upon lies the best hope of reducing confusion and avoiding controversy.

As the most effective measure of simplification, the general practice of quoting for export, as far as possible, either "F. A. S. Vessel," "F. O. B. Vessel" or "C. I. F.," is strongly recommended. All of these terms are readily understood abroad and difficult of misinterpretation, and concentration on this small list, it is felt, will be markedly influential in avoiding misunderstanding and disputes.

DEFINITIONS OF EXPORT QUOTATIONS.

The following are, in their order, the normal situations under which an export manufacturer or shipper may desire to quote prices. It is understood that unless a particular carrier is specified by the buyer, the goods will be delivered to the carrier most conveniently located to the shipper.

1. When the price quoted applies only to an inland shipping point and the seller merely undertakes to load the goods on or in the cars or lighters furnished by the railroad company serving the industry, without other designation as to routing, the proper term is:

"F. O. B. (named point)."

Under this quotation:

A. Seller must—

- (1) Place goods on or in cars or lighters.
- (2) Secure railroad bill of lading.
- (3) Be responsible for loss and/or damage until goods have been placed in or on cars or lighters at forwarding point, and clean bill of lading has been furnished by the railroad company.

B. Buyer must—

- (1) Be responsible for loss and/or damage incurred thereafter.
- (2) Pay all transportation charges including taxes, if any.
- (3) Handle all subsequent movement of the goods.

2. When the seller quotes a price including transportation

charges to the port of exportation without assuming responsibility for the goods after obtaining a clean bill of lading at point of origin, the proper term is:

"F. O. B. (named point) FREIGHT PREPAID TO (named point on the seaboard)."

Under this quotation:

A. Seller must—

- (1) Place goods on or in cars or lighters.
- (2) Secure railroad bill of lading.
- (3) Pay freight to named port.
- (4) Be responsible for loss and/or damage until goods have been placed in or on cars or lighters at forwarding point, and clean bill of lading has been furnished by the railroad company.

B. Buyer must—

- (1) Be responsible for loss and/or damage incurred thereafter.
- (2) Handle all subsequent movement of the goods.
- (3) Unload goods from cars.
- (4) Transport goods to vessels.
- (5) Pay all demurrage and/or storage charges.
- (6) Arrange for storage in warehouse or on wharf where necessary.

3. Where the seller wishes to quote a price, from which the buyer may deduct the cost of transportation to a given point on the seaboard, without the seller assuming responsibility for the goods after obtaining a clean bill of lading at point of origin, the proper term is:

"F. O. B. (named point) FREIGHT ALLOWED TO (named point on the seaboard)."

Under this quotation:

A. Seller must—

- (1) Place goods on or in cars or lighters.
- (2) Secure railroad bill of lading.
- (3) Be responsible for loss and/or damage until goods have been placed in or on cars or lighters at forwarding point, and clean bill of lading has been furnished by the railroad company.

B. Buyer must—

- (1) Be responsible for loss and/or damage incurred thereafter.
- (2) Pay all transportation charges (buyer is then entitled to deduct from the amount of the invoice the freight paid from primary point to named port).
- (3) Handle all subsequent movement of the goods.
- (4) Unload goods from cars.
- (5) Transport goods to vessel.
- (6) Pay all demurrage and/or storage charges.
- (7) Arrange for storage in warehouse or on wharf where necessary.

4. The seller may desire to quote a price covering the transportation of the goods to seaboard, assuming responsibility for loss and/or damage up to that point. In this case, the proper term is:

"F. O. B. Cars (named point on seaboard)."

Under this quotation:

A. Seller must—

- (1) Place goods on or in cars.
- (2) Secure railroad bill of lading.
- (3) Pay all freight charges from forwarding point to port on seaboard.
- (4) Be responsible for loss and/or damage until goods have arrived in or on cars at the named port.

B. Buyer must—

- (1) Be responsible for loss and/or damage incurred thereafter.
- (2) Unload goods from cars.
- (3) Handle all subsequent movement of the goods.
- (4) Transport goods to vessel.
- (5) Pay all demurrage and/or storage charges.
- (6) Arrange for storage in warehouse or on wharf where necessary.

5. It may be that the goods, on which a price is quoted covering the transportation of the goods to the seaboard, constitute less than a carload lot. In this case, the proper term is: "F. O. B. Cars (named port) L. C. L."

Under this quotation:

A. Seller must—

- (1) Deliver goods to the initial carrier.
- (2) Secure railroad bill of lading.
- (3) Pay all freight charges from forwarding point to port on seaboard.
- (4) Be responsible for loss and/or damage until goods have arrived on cars at the named port.

B. Buyer must—

- (1) Be responsible for loss and/or damage incurred thereafter.
- (2) Handle all subsequent movement of the goods.
- (3) Accept goods from the carrier.
- (4) Transport goods to vessel.
- (5) Pay all storage charges.
- (6) Arrange for storage in warehouse or on wharf where necessary.

6. Seller may quote a price which will include the expense of transportation of the goods by rail to the seaboard, including lighterage. In this case, the proper term is:

"F. O. B. Cars (named port) LIGHTERAGE FREE."

Under this quotation:

A. Seller must—

- (1) Place goods on or in cars.
- (2) Secure railroad bill of lading.
- (3) Pay all transportation charges to, including lighterage at, the port named.
- (4) Be responsible for loss and/or damage until goods have arrived on cars at the named port.

B. Buyer must—

- (1) Be responsible for loss and/or damage incurred thereafter.
- (2) Handle all subsequent movement of the goods.
- (3) Take out the insurance necessary to the safety of the goods after arrival on the cars.
- (4) Pay the cost of hoisting goods into vessel where weight of goods is too great for ship's tackle.
- (5) Pay all demurrage and other charges, except lighterage charges.

7. The seller may desire to quote a price covering delivery of the goods alongside overseas vessel and within reach of its loading tackle. In this case, the proper term is:

"F. A. S. vessel (named port)."

Under this quotation:

A. Seller must—

- (1) Transport goods to seaboard.
- (2) Store goods in warehouse or on wharf if necessary, unless buyer's obligation includes provision of shipping facilities.
- (3) Place goods alongside vessel either in a lighter or on the wharf.
- (4) Be responsible for loss and/or damage until goods have been delivered alongside the ship or on wharf.

B. Buyer must—

- (1) Be responsible for loss and/or damage thereafter, and for insurance.
- (2) Handle all subsequent movement of the goods.
- (3) Pay cost of hoisting goods into vessel where weight of goods is too great for ship's tackle.

8. The seller may desire to quote a price covering all expenses up to and including delivery of the goods upon the overseas vessel at a named port. In this case, the proper term is: "F. O. B. vessel (named port)."

Under this quotation:

A. Seller must—

- (1) Meet all charges incurred in placing goods actually on board the vessel.
- (2) Be responsible for all loss and/or damage until goods have been placed on board the vessel.

B. Buyer must—

- (1) Be responsible for loss and/or damage thereafter.
- (2) Handle all subsequent movement of the goods.

9. The seller may be ready to go farther than the delivery of his goods upon the overseas vessel and be willing to pay transportation to a foreign point of delivery. In this case, the proper term is:

"C. & F. (named foreign port)."

Under this quotation:

A. Seller must—

- (1) Make freight contract and pay transportation charges sufficient to carry goods to agreed destination.
- (2) Deliver to buyer or his agent proper bills of lading to the agreed destination.
- (3) Be responsible for loss and/or damage until goods have been delivered alongside the ship and clean ocean bill of lading obtained (seller is not responsible for delivery of goods at destination).

B. Buyer must—

- (1) Be responsible for loss and/or damage thereafter and must take out all necessary insurance.
- (2) Handle all subsequent movement of the goods.
- (3) Take delivery and pay costs of discharge, lighterage and landing at foreign port of destination in accordance with bill of lading clauses.
- (4) Pay foreign customs duties and wharfage charges, if any.

10. The seller may desire to quote a price covering the cost of the goods, the marine insurance on the goods, and all transportation charges to the foreign point of delivery. In this case, the proper term is:

"C. I. F. (named foreign port)."

Under this quotation:

A. Seller must—

- (1) Make freight contract and pay freight charges sufficient to carry goods to agreed destination.
- (2) Take out and pay for necessary marine insurance.
- (3) Be responsible for loss and/or damage until goods have been delivered alongside the ship, and clean ocean bill of lading and insurance policy have been delivered to the buyer, or his agent. (Seller is not responsible for the delivery of goods at destination, nor for payment by the underwriters of insurance claims.)
- (4) Provide war risk insurance, where necessary, for buyer's account.

B. Buyer must—

- (1) Be responsible for loss and/or damage thereafter, and must make all claims to which he may be entitled under the insurance directly on the underwriters.

- (2) Take delivery and pay costs of discharge, lighterage and landing at foreign port of destination in accordance with bill of lading clauses.
- (3) Pay foreign customs duties and wharfage charges, if any.

EXPLANATIONS OF ABBREVIATIONS.

F. O. B.	Free on board.
F. A. S.	Free alongside ship.
C. & F.	Cost and Freight.
C. I. F.	Cost, insurance and freight.
L. C. F.	Less than carload lot.

RUBBER IN THE SAFETY COUNCIL.

THE NATIONAL SAFETY COUNCIL, made up of prominent men in all lines of industry, now has a rubber section. Although this is but a beginning, a score of the largest rubber companies are members and send from two to half a dozen representatives to each meeting. At the first meeting there were present:

E. H. Fitzgerald, M. Klein, The Federal Rubber Co., Cudahy, Wisconsin; Harold Martin, T. J. Dwyer, H. T. Greene, and E. Focand, The Fisk Rubber Co., Chicopee Falls, Massachusetts; P. B. Martens, T. S. Petty, C. G. Dimcombe, A. L. Weyland, E. S. Hoener, N. A. Shepard and M. F. Leitzel, The Firestone Tire & Rubber Co., Akron, Ohio; R. N. Watson, and P. A. Belden, The Goodyear Tire & Rubber Co.; W. N. Fitch, W. L. Snyder, J. C. Howard, E. P. Raiford, A. C. Mack, W. G. Oberholser, E. K. Davis, G. A. Knoffer, and R. B. Howe, The B. F. Goodrich Rubber Co.; H. G. Pushee, The General Tire & Rubber Co., Akron, Ohio; A. L. Rose, The Kelly-Springfield Tire Co., Akron, Ohio; S. M. Shott, Morgan & Wright, Detroit, Michigan, R. W. Fogarty, A. C. Peterjohn, United States Rubber Co., Mechanical Goods Division, Cleveland, Ohio; W. H. Larkin, Jr., J. W. Townsen, United States Rubber Co., Mechanical Goods Division, Passaic, New Jersey; R. L. Gould, United States Rubber Co.; Dr. Haron, Hood Rubber Co., Watertown, Massachusetts.

ROUND TABLE SUGGESTIONS.

In discussing safety appliances for washers, crushers and mills the following were cited: use of wooden paddles to push rubber between walls; cutting blocks of rubber wedge shape to facilitate entry between rolls; mill rolls placed shoulder high, bars in front of washers over which the sheet of rubber is fed; individual clutches on each mill which are inspected daily; automatic reversing devices.

Electric signals from motor pit to each mill in every line; motor pit switch-boards set six feet above floor to give clear view of line; reports of tests of safety devices signed by inspectors and delivered regularly to master mechanic.

Calenders equipped with electric clutch and brake; special gears for opening center and lower rolls, rolls being lowered so that opening clears the hand; triangular casting at opening with $\frac{3}{4}$ -inch clearance to prevent men from getting near opening; split casting and one-inch slot on fabric calenders; inch bar across calender connected with bell crank to trip switch operating dynamic bar on calendar; floor near calender surfaced with carborundum.

Automatic conveyor system with hydraulic opening for opening molds after curing; special opening bar with increased leverage; special track for hauling molds and cores; endeavor to make men use respirators on dusty job handling compounds; milk served to men in compound room, mills hooded and strong suction used; danger of poisoning from benzol, rash on hands and free from hexamethylene tetramine (urotropin), eliminated by applying borax in solution with 20 per cent gum arabic.

RUBBER FACTORY ACCIDENT PREVENTION ACTIVITIES TO BE STANDARDIZED.

A census of all the accidents that have occurred in the rubber industry will be undertaken by the Rubber Section of the National Safety Council with the view of standardizing accident pre-

vention activities and accident statistics in that industry. This was decided on at a meeting of the executive committee of the Rubber Section, held at the headquarters of the National Safety Council in Chicago on January 20 and 21. Among those present were S. M. Schott, of the Morgan & Wright plant of the United States Rubber Co., Detroit, Michigan, chairman of the section; E. H. Fitzgerald, Federal Rubber Co., Cudahy, Wisconsin, vice-chairman of the section; R. M. Watson, The Goodyear Tire & Rubber Co., Akron, Ohio, secretary; W. N. Fitch, The B. F. Goodrich Co., Akron, Ohio, chairman of the bulletin committee, and H. T. Martin, The Fisk Rubber Co., Chicopee Falls, Massachusetts, chairman of the program committee.

Plans were also laid at this meeting for a nation-wide membership campaign with the view of including in the Rubber Section of the Council every progressive rubber plant in the country. The officers of the section laid the ground work for an extensive bulletin service and for a sectional program at the next annual congress of the National Safety Council. Twenty-six bulletins depicting the principal hazards in the rubber manufacturing industry and methods of elimination will be issued by this section to its members during the ensuing year along with the general bulletins of the Council.

The tentative program for the 1920 safety congress calls for three sessions of the Rubber Section, when the reports of committees will be followed by papers on "The Present and Future of Safety in the Rubber Industry," "Health Hazards in the Rubber Industry," and a general round-table discussion of these topics. The program includes papers and discussions on "Making Mills and Calenders Safe," "Handling Materials," and "Vulcanizing Apparatus." The election of officers will be followed by formal papers and discussions of "Industrial Sanitation" and "Methods of Educating Workmen in Safety."

R. M. Watson was appointed chairman of the committee which will investigate accidents and accident statistics with the view of standardization. The findings of this committee and the classifications recommended will be presented at the next safety congress. H. T. Martin was appointed chairman of the committee on standardization of safety rules and safety instruction. The companies that are now members of the Rubber Section of the National Safety Council are as follows:

Batavia Rubber Co., Batavia, New York; Boston Woven Hose & Rubber Co., Boston, Massachusetts; Braender Rubber & Tire Co., Rutherford, New Jersey; Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ont., Canada; Electric Hose & Rubber Co., Wilmington, Delaware; Federal Rubber Co., Cudahy, Wisconsin; Firestone Tire & Rubber Co., Akron, Ohio; The Fisk Rubber Co., Chicopee Falls, Massachusetts; General Tire & Rubber Co., Akron, Ohio; Gillette Rubber Co., Eau Claire, Wisconsin; The B. F. Goodrich Co., Akron, Ohio; The Goodyear Tire & Rubber Co. of Canada, Limited, Toronto, Ontario, Canada; The Goodyear Tire & Rubber Co., Akron, Ohio; Gutta Percha & Rubber Limited, Toronto, Ontario, Canada; Hood Rubber Co., Watertown, Massachusetts; Kelly-Springfield Tire Co., Akron, Ohio; The McGraw Tire & Rubber Co., East Palestine, Ohio; Mechanical Rubber Co., Cleveland, Ohio; The Miller Rubber Co., Akron, Ohio; New Jersey Car Spring & Rubber Co., Inc., Jersey City, New Jersey; Norwalk Tire & Rubber Co., Norwalk, Connecticut; Oak Tire & Rubber Co., Limited, Oakville, Ontario, Canada; Pennsylvania Rubber Co., Jeanette, Pennsylvania; Philadelphia Rubber Works Co., Akron, Ohio; Plymouth Rubber Co., Canton, Massachusetts; Quaker City Rubber Co., Philadelphia, Pennsylvania; Racine Rubber Co., Racine, Wisconsin; Republic Rubber Corp., Youngstown, Ohio; Rotary Tire & Rubber Co., Zanesville, Ohio; Sprague Tire & Rubber Co., Omaha, Nebraska; Stowe & Woodward Co., Campello, Massachusetts; Thermoid Rubber Co., Trenton, New Jersey; United States Rubber Co., New York City; United States Rubber Reclaiming Co., Inc., New York City.

Machinery Equipment for Tire Repairing and Rebuilding.

THE TIRE REPAIR BUSINESS has shared in the rapid increase of the automobile and tire industries and many special machines and appliances have been developed for rapid and perfect work. The present article is limited to the principal types of

TIRE LASTS.

repair shop equipment that are most essential for the work of repairing, retreading and rebuilding tires.

TIRE LASTS.

The tire last is indispensable for supporting the tire while making

fabric repairs. It is made of cast iron, the shape of the inside of the casing with convenient brackets for attaching to the bench.

TIRE BUILDING STAND.

For rebuilding or retreading tires the tire building stand is standard equipment. For this work it is usually provided with a

BUILDING STAND.

collapsible core, as shown in the illustration. The stand is fitted with an automatic locking device that holds the core securely in any desired position, so that the tire can be revolved in either direction or inclined at any angle.

RETREADING KETTLE VULCANIZERS.

In repair plants where retreading is done on a moderate scale, vertical pot heaters or vulcanizers are usually employed for curing the retread, owing to the small steam consumption and relatively small installation cost.

They usually vary in capacity from two to four tires. Generally they are of the simple kettle type, although the annular construction is particularly economical of steam for a small installation, and will cure from two to four casings at one heat. Others have bolted-on lids or heads held in place by a number of hinged bolts fitting into slots in the edges of the kettle and lid. There is also a boltless variety in which the lid is opened and closed by revolving it about eight inches on a central trun-

nion, and holding it against pressure by lugs engaging with companion lugs on the supporting frame. Some lids are raised by a screw, chain block or weight, and swung to one side on a crane

or overhead track; others are hinged and counterbalanced. Where the lid and the vulcanizer come together the surfaces are machined to accommodate a standard square packing ring.

Medium size vulcanizers average 37½ inches in diameter and have a depth of 10 to 26 inches with capacity for two to seven 36-inch casings. Large ones average 43 or 43½ inches in diameter and have a depth of 16 to 31 inches with capacity for

four to seven 42-inch casings. Regular equipment includes a steam gage, safety valve, two test cocks and supporting

HORIZONTAL RETREADING VULCANIZERS.

In repair plants where considerable retreading is done a horizontal retreading vulcanizer, capable of taking care of all sizes of casings is usually employed. These vulcanizers have a bolted-on, hinged door requiring no overhead tackle or counterweight. They average 46½ or 47 inches inside diameter, and 40 inches in length, with a capacity for six to eight 42-inch tires.

RETREAD MOLD FOR RIBBED OR NON-SKID TREADS.

A retread mold for curing one casing at a time, stands at con-

TWIN RETREADING MOLD.

venient height on three legs and is very economical of steam.

HORIZONTAL VULCANIZER.

RETREADING MOLD.

KETTLE VULCANIZER.

CAVITY RETREAD MOLD.

is turned into the mold, with drip cocks opened and the casing remains in the mold until cured. When removed from mold and rim the tire has the appearance of a new casing.

One of the advantages of the retread mold is that the outward pressure exerts an even tension during the cure, so that each cord in the tire carries its share of the load and there are no wrinkles or buckles, causing one ply to work against another and develop a break.

TWIN RETREADING MOLDS.

With twin full-circle molds two casings may be cured simultaneously, both of the same size or neighboring

COMBINATION SECTIONAL VULCANIZER.

sizes, such as 30 by 3½ and 31 by 4-inch, according to the construction of the molds. They may be provided with ribbed or special non-skid tread designs. The molds consist of three sections, each cored to receive steam. The center member is stationary, mounted on edge and supported by braced legs. It has one-half of each mold machined on either side, while each of the two outside hinged members has the corresponding half. Steam is admitted to all three sections at their lowest points and condensation in the molds is removed by the same pipes. The two outside sections have hinged, swing steam joints directly under the main hinges and can be opened and closed without escape of steam. Four bolts hold the three sections of the mold together. Circular air bags are placed inside the cas-

The beads and side walls are not subjected to any steam whatever that might impair the fabric through overcuring or cause separation of the beads. No wrapping is required, and as the pressure of the mold is everywhere uniform, no edges of the plies nor low spots will be visible, nor will the tread be loose as sometimes happens after curing in a pot heater because of careless wrapping.

The use of a retread mold is simple. After the new tread has been applied, an air bag is placed in the casing which is mounted on an ordinary rim. The top half of the mold is raised, the casing placed within, and both halves are bolted together. The air bag is then inflated, steam

SECTIONAL CAVITY VULCANIZER.

ings and inflated to 125 to 150 pounds' pressure during the cure.

PNEUMATIC TRUCK TIRE SECTIONAL VULCANIZER.

An objection to the principle on which all cavity retread molds work is the fact that parts of casings larger or smaller than 36-inch are subjected to a double cure. The circumference of a 36-inch diameter circle is 113 inches, while that of a 30-inch casing is only 94 inches; obviously when a 30-inch casing is placed three times in the mold for curing, 19 inches of the casing is subjected to a double cure. A 37-inch tire requires four cures to cover its circumference of 116½ inches, yet four applications of the mold cover nearly 151 inches, so that about 34½ inches are subjected to double cure.

SECTIONAL CAVITY VULCANIZERS.

Sectional cavity vulcanizers for curing outside fabric and tread repairs consist of one to five molds, steam jacketed around the cavity, cast *en bloc* or singly, and made in either one-fourth or one-fifth circle to measure from 15 to 18 inches long on the tread. Three, four and five-cavity outfits are most common, and will accommodate all casings from 2¼ or 2½ to 5-inch. The molds are mounted on substantial metal stands of convenient height, and some are equipped with a

INNER TUBE VULCANIZER.

self-contained boiler. Separate molds of different sizes, each standing on short metal legs for mounting on a wooden bench, are often assembled with pipe connections, according to local requirements. With a separate mold for each size casing, no reducing shells are required, direct contact is always certain between the hot walls of the vulcanizer and the casing, and there is no uncertainty as to evenness of cure.

INSIDE PATCH VULCANIZER.

CAVITY RETREAD MOLD.

When retreading is done on a moderate scale, the cavity retread mold is used. It is similar in operation to the ordinary sectional cavity vulcanizers for curing tread repairs, but is made to cure one-third instead of one-fourth or one-fifth of a 36-inch diameter circle.

Air-cooled flanges are a feature of one make of sectional cavity vulcanizers. One-eighth inch of heat-resisting material is placed between the flanges and vulcanizer, causing both ends of the cavity to remain cool while heat is maintained up to this heat insulating material, thus obviating unsightly and damaging lumps

AIR BAG SYSTEM.

assembly of parts can be changed in a few minutes to meet the requirements of the work in hand.

PNEUMATIC TRUCK TIRE VULCANIZERS.

The introduction of the giant pneumatic tire has opened a new field in the tire repair business, requiring large sectional vulcanizers. They are made in sizes to fit 6, 7 and 8-inch tires, respectively, each vulcanizer equipped with one pair of straight side lead molds.

INSIDE PATCH VULCANIZERS.

Inside patch vulcanizers made in one-fourth or one-fifth circle, come in small, medium and large sizes. They are of smooth cast iron, designed for mounting on bench or stand, and have suitable steam pipe connections, valves and pet cocks to release cold air from the form. A triangular frame within the supports, together with one or two thumb or crank screws or nuts, provide the necessary bandage tightener.

POWER RAG WRAPPING MACHINE.

INNER TUBE REPAIR VULCANIZER.

Inner tube repairs are vulcanized under pressure, in contact with a steam-heated plate.

Adjustable and constant pressure is applied to the tubes while being cured by means of heavy oil-tempered springs, which draw down the swinging levers. A steel nut is placed inside the spring and the handle can be screwed in or out of the nut so that a pressure of six ounces or fifty pounds can be brought to bear on the repair. The adjustment can be changed in an instant.

Where solid screw clamps are used it is difficult to properly judge the pressure on the repair. Moreover, as the gum flows during the cure, the thickness of the repair is reduced, partly relieving the pressure on the tube patch. This does not occur with the spring tension system.

AIR BAG SYSTEM.

In the air bag system of tire repairing, sand bags and wire spirals are displaced by inflatable sectional bags. These air bags are made of fabric and rubber, and at one end have a tube and air valve through which air is forced into the bag. They come in different sizes—one for each size of casing. A machine

HAND RAG WRAPPING MACHINE.

equipped with air bag molds enables the operator to save time, economize on materials, and turn out a repair that can be guaranteed to outlast the rest of the tire.

The cross-sectional view of a three-cavity vulcanizer, herewith, shows how the steam is conducted to all parts of the three cavi-

ties of the air bag molds. Each cavity is so constructed that the steam enters at the lowest point, and rises to the highest, avoiding steam pockets. This construction renders all the molds self-draining. By means of reducing shells, various sizes of tires can be accommodated in the same mold cavity.

POWER RAG WRAPPING MACHINES.

In large plants power wrapping machines are used in preparing re-treaded casings for curing. They wrap much more tightly, more quickly and at less expense than can be done by hand.

In one type the tire lies flat on a table, and revolves on three rollers driven by two upright feed rollers. There are two other vertical rollers adjustable to the diameter of the casing. A rotary drum, belt-driven, that carries the spool containing the tape, rolls on fiber wheels. One or two spools of tape are required to wrap a tire. The hinged gate of the revolving spool drum is set to the opening in the frame to admit or remove the tire.

A machine of similar construction is built to be fastened to a wall or post. It is quickly adjustable to casings of all sizes by a hand-wheel that separates or draws together two feed rollers.

In connection with these machines a power spool winder is used to roll the wrapping tape ready for use.

HAND RAG WRAPPING MACHINES.

The operation of hand rag wrapping is as follows: The wet bandage is tightly wound on its spool and dropped into a recessed slot in the frame and the pressure arm released against the bandage. A portion of the bandage is unwound and passed through the guides and once around the tire, establishing an over-lap in the bandage and securing the end thereby. The yielding roller arm is clasped about the tire, which is placed on a pair of trestle bars or between two benches, and the machine is rotated around the tire, which causes the bandage to be resistingly drawn from the spool and forcibly applied to the tire. The average tire takes two twenty-five-yard bandages, of course, depending upon the amount of overlap or feed, which is regulated at the option of the operator.

BUFFING STANDS.

Buffing stands are made either with column base and counter-shaft and pulleys for the ceiling, or without countershaft and base for mounting on a bench. Several types have the spindle extended on one end so that a casing can be buffed with a wire brush without interference from the belt or column of the stand, while the short end gives a rigid support for a rotary rasp. An emery wheel may be substituted when desired for grinding tools.

TREAD ROLLERS.

Tread rollers save much time and labor, rolling down the rubber and fabric much more effectively than it is possible to do by hand, and insuring a secure repair. The device consists of a frame designed to be mounted on a bench, a concave and a convex roller, operating crank and hand wheel screw to adjust the space between the rollers.

BUFFING STAND.

TREAD ROLLING MACHINE.

Government Standard Specifications for Rubber Tires, Tire Repairs and Accessories.

General Specifications.

GENERAL.

THESE SPECIFICATIONS cover bicycle, motorcycle and automobile ribbed or non-skid pneumatic casings, solid tires, pneumatic inner tubes and accessories used by the War Department. The following are details and tests as are common to the products. For specific information applying directly to particular articles, see detailed specifications which shall take precedence whenever there is any conflict.

All casings shall be of the manufacturer's standard non-skid, clincher type, designed for the S. A. E. clincher rim of the sizes as specified in the detailed specifications.

CONSTRUCTION.

To be manufactured from the best designated material; free from all imperfections and of dimensions as given in the detailed specifications or proposal submitted to manufacturer.

(a) ALL FABRIC must be thoroughly dried in accordance with standard manufacturing practice before it is rubberized. Any change in the weight or construction must meet with the approval of the War Department and authority be given the manufacturer in writing.

(b) FLAPS: Each casing shall have a flap in accordance with standard manufacturing practice unless otherwise specified.

(c) LINING: The inside of each casing shall be properly lined in accordance with standard manufacturing practice.

MARKING, WRAPPING AND PACKING.

(Does not apply to solid tires.)

(a) MARKING: Casings shall be plainly marked with raised rubber letters, "U. S. A., manufacturer's name, serial number, date, size, and the equivalent metric system as recommended by the Society of Automotive Engineers.

(b) WRAPPING: All casings shall be spirally wrapped according to standard practice and properly labeled on the outside and marked "U. S. A., size, type, name of manufacture, and the month and year of manufacture stamped thereon in a conspicuous place.

(c) PACKING: Packing shall conform to requirements as outlined in the original proposal.

MATERIAL.

(a) FABRIC: The cotton fabric or cord layers shall be well, evenly, and firmly woven from good cotton, as free from unsightly defects, dirt, knots, lumps, and irregularities of twist as is consistent with the best manufacturing practice and conform to detailed specifications.

(b) RUBBER COMPOUNDS: They shall conform to the detailed specification and be free from ingredients known to the rubber trade as "oil substitutes," and contain no reclaimed rubber unless specifically permitted.

When new rubber is specified, it shall be the best quality new wild or plantation rubber.

TESTS.

All tests on material as a whole and on individual parts shall be performed according to methods adopted by the National Bureau of Standards as outlined in their Circular No. 38, "Testing of Rubber Goods," in effect at date of opening of proposal.

Hydrostatic and tensile tests shall be in pounds per square inch. Hydrostatic tests are to be made at the discretion of the inspector.

(a) FABRIC: The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of fabric shall be employed.

The tensile strength shall be obtained by cutting strips from fabric 6 inches long, 1 1/4 inches wide and unraveled from each side to a width of one inch. Jaws of testing machine shall not be more than 1 inch wide and 3 inches apart, separating at the rate of 12 inches per minute. Results obtained by taking the average of three tests each on both warp and filling shall be accepted as the tensile strength of the fabric. The tests shall be made when practicable after conditioning the fabric in an at-

mosphere having a relative humidity of 65 per cent and at a temperature of 70 degrees F. for two hours. When not practicable to test as above, the fabric may be tested under existing humidity conditions and results corrected to a 6 per cent moisture basis by multiplying by the following factor:

$$\frac{100}{100 \text{ plus } 7 \text{ (per cent moisture - 6)}}$$

NOTE.—The factor will be less than unity when the per cent moisture is greater than 6, and vice versa.

Moisture shall be determined by weighing six samples together before testing, and tensile strength immediately obtained in rapid succession. The broken samples (entire) after rupture shall be placed in a ventilated drying oven at 105 degrees to 110 degrees C. (221 degrees to 230 degrees F.) until weight is constant. Moisture present shall be calculated on the basis of the bone dry sample.

All fabric weights are given in ounces per square yard, and shall be calculated on 6 per cent moisture basis. Tolerance 3 per cent, plus or minus.

(b) CORD FABRIC: Tensile strength of cords shall be based on 10 individual cords taken from each cord and the results must be up to the standard specification of the individual manufacturer.

(c) FRICTION OR ADHESION: The friction between plies of fabric or rubber compound shall be determined on a sample 1 inch in width, measured circumferentially, and be cut from the casing and tested by using a standard friction or dead weight machine.

On a section of the casing the plies are started and pulled down 2 inches at one bead; which bead is clamped in the jaws of the friction testing apparatus. Test shall be made on any or all plies of the fabric. The adhesion between breaker and tread, breaker and cushion, cushion and carcass, side wall and carcass shall be determined. The rate of separation shall be not more than 1 inch per minute when the weight outlined in the detailed specification is used.

(d) RUBBER COMPOUND: Test pieces shall be cut longitudinally and shall be 1/4-inch wide over a gage length of 2 inches, the ends being gradually enlarged to width approximately 1 inch. Results shall be based upon the average of four tests made at a temperature between 65 degrees and 90 degrees F., unless otherwise specified.

The tensile strength shall be determined with a machine, the jaw separating at the rate of 20 inches per minute. The permanent set shall be determined by sample stretched 2 inches to 10 inches for 10 minutes followed by a rest of 10 minutes, unless otherwise specified.

(e) ROAD TEST: Casings will not be given consideration unless the maker submitting the bid furnishes an affidavit stating that he has maintained and will continue to maintain machines used exclusively for test work, as called for in detailed specifications.

The speeds, loads, tire sizes, inflations and road conditions must be such that the casings are properly tested. The Government may appoint an inspector to see that the above conditions are complied with.

A bidder must supply an affidavit before delivering casings to the Government, stating that the casings to be delivered are the same cross-section and practically duplicate, in construction and material as casings which he has previously tested in accordance with the above, and a sufficient number of casings satisfactory to the Government, shall have averaged on the rear wheels the number of miles as called for in detailed specifications.

INSPECTION.

The Government reserves the right to make any inspection test or analysis necessary to insure the product meeting all requirements of specification which shall be conducted in accordance with methods outlined and approved by the War Department, and which shall be furnished to successful bidders.

PNEUMATIC AUTO CASING (FABRIC CONSTRUCTION).

NO. GS 1010	30 by 3 1/2 inches.
NO. GS 1011	31 by 4 inches.

GENERAL.

(a) This specification covers requirements for pneumatic auto casings of fabric construction, size 30 by 3½ inches, which shall be designed to carry a load of 570 pounds when inflated to 55 pounds per square inch and size 31 by 4 inches a load of 815 pounds when inflated to 65 pounds per square inch; both designed for the S. A. E. clincher rim size 30 by 3½ inches.

(b) See General Specifications for tires which are a part hereof.

CONSTRUCTION.

See General Specifications.

(a) Splices on the first ply of fabric shall be gum stripped.

(b) Carcass of casing for 30 by 3½-inch shall consist of not less than four nor more than five separate plies of tire fabric and 31 by 4-inch not less than five nor more than six separate plies, with friction coat on two sides and skim coat on one side. The gage of one ply frictioned on two sides and skim coated on one shall be at least 0.045-inch. Each ply shall have not more than two splices, which must be at least 7 inches apart, and the splices in the casing shall be at least 3 inches apart; all measurements on the circumference of the casing.

(c) Beads shall be constructed with a core filler as in standard commercial practice.

(d) One chafing strip of square-woven fabric weighing not less than 8 ounces per square yard shall be used on each side of the casing; and shall extend upward on the side of the casing at least ¾-inch from the channel of the bead.

(e) There shall be a cushion of rubber compound applied over the fabric which shall be wider than the breaker. The minimum gage shall be 0.045-inch for 30 by 3½-inch and 0.050-inch for 31 by 4-inch.

(f) Over the cushion there shall be at least one breaker strip of open weave fabric made from long-staple cotton weighing not less than 8 ounces per square yard, as in standard commercial practice, coated on both sides with a rubber compound which shall insure a perfect union between the cushion and tread after the cure. Breaker strip for 30 by 3½-inch, minimum width 2½ inches, for 31 by 4-inch, minimum width 2½ inches.

(g) Rubber dimensions:

Sizes	30 x 3½	31 x 4
Thickness	Inches, Minimum.	Inches, Minimum.
Tread of casing in center.....	⅞	¾
Tread, exclusive of non-skid portion on center.....	⅞	¾
Side wall.....	0.05	0.05

(h) No flaps shall be supplied.

MARKING, WRAPPING AND PACKING.

See General Specifications.

MATERIAL.

See General Specifications.

(a) FABRIC must be square woven (23 by 23) from Egyptian long-staple cotton or its physical equivalent, as approved by the Government, weighing 1½ ounces per square yard.

(b) Rubber compound:

	New Rubber, Per Cent Volume.	Reclaimed Rubber, Per Cent Weight.
	Minimum.	Maximum.
Tread.....	65	15
Side wall.....	65	15
Friction and cushion.....	75	..

TESTS.

(a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be for 30 by 3½-inch less than 3-7/16 inches; and for 31 by 4-inch, 4 inches.

(b) Shall withstand water pressure of 300 pounds per square inch without injury.

(c) FABRIC: Tensile strength, warp or filling, 165 pounds minimum.

(d) FRICTION:

	Minimum	Pounds.
Strength of union between plies of fabric.....	minimum	16
Strength of union between breaker and tread.....	minimum	28
Strength of union between breaker and cushion.....	minimum	28
Strength of union between cushion and carcass.....	minimum	16
Strength of union between side wall and carcass.....	minimum	10

(e) RUBBER COMPOUND:

	Tread.	Side Wall.
	Minimum.	Minimum.
Ultimate strength.....	2-11	2-11
Set.....	2-11	2-11
Stretch.....	2-10	2-10
Set.....	25	25

(f) ROAD TEST: Manufacturer shall maintain at least two cars used exclusively for test work. They shall average at least 1,000 miles per car per week; and a sufficient number of casings (not less than six) shall have averaged on the rear wheels at least 4,000 miles.

INSPECTION.

See General Specifications.

PNEUMATIC AUTO CASINGS (CORD CONSTRUCTION).

NO. GS 1020.....	38 by 4 inches
NO. GS 1021.....	38 by 5 inches
NO. GS 1022.....	36 by 6 inches
NO. GS 1023.....	38 by 7 inches
NO. GS 1024.....	40 by 8 inches

GENERAL.

(a) This specification covers requirements for pneumatic automobile casings of cord construction which conform to the following:

	Designed to Carry Load—Pounds.	Inflation Per Square Inch—Pounds.
Size.....	815	65
33 by 4 inches.....	1,500	75
36 by 6 inches.....	2,000	90
38 by 7 inches.....	2,700	100
40 by 8 inches.....	3,650	110

Designed for S. A. E. straight side rim as follows:

Casing Size.	Rim Size.
33 by 4 inches.....	32 by 3½ inches and 33 by 4 inches.
35 by 5 inches.....	34 by 4½ inches.
36 by 6 inches.....	36 by 6 inches.
38 by 7 inches.....	38 by 7 inches.
40 by 8 inches.....	40 by 8 inches.

(b) See General Specifications for tires, which are a part hereof.

CONSTRUCTION.

See General Specifications.

(a) Casings shall consist of number of separate plies of cord, applied in such manner that an equal number of plies shall run in each diagonal direction across the casing as follows:

	Number of Plies.	
	Minimum.	Maximum.
Size.....	4	8
33 by 4 inches.....	4	10
35 by 5 inches.....	4	12
36 by 6 inches.....	4	12
38 by 7 inches.....	4	14
40 by 8 inches.....	4	16

(b) Two chafing strips weighing not less than 8 ounces per square yard shall be used in each side of casing. Each chafing strip shall extend upward on side of casing from the heel of the bead as follows:

	Extension Upward—Inches.
Size.....	1
33 by 4 inches.....	1
35 by 5 inches.....	1½
36 by 6 inches.....	1½
38 by 7 inches.....	1¾
40 by 8 inches.....	2

(c) One chafing strip shall extend at least 3/16-inch above the other for sizes 33 by 4 inches and 35 by 5 inches; and ¼-inch for 36 by 6 inches, 38 by 7 inches, and 40 by 8 inches.

(d) There shall be a cushion of rubber compound applied over the cords, which shall be wider than the breaker and gage as in Table I.

(e) Over the cushion there shall be at least one breaker strip of open-weave fabric made from long-staple Egyptian cotton or its physical equivalent as approved by the Government; weight as in Table I, such as in standard commercial practice, coated on both sides with a rubber compound to insure a perfect union between the cushion and tread after cure.

TABLE I.

	Weight of Fabric.	Thickness of Breaker.	Thickness of Cushion.	Thickness of Tread.	Thickness of Side Wall.
	Per Square Inch.	Per Square Inch.	Per Square Inch.	Per Square Inch.	Per Square Inch.
Size	Inches.	Ounces.	Inches.	Ounces.	Inches.
33 by 4 inches.....	0.05	2½	10	1½	0.0625
35 by 5 inches.....	0.0625	3½	10	1½	0.0625
36 by 6 inches.....	0.08	4½	10	1½	0.0625
38 by 7 inches.....	0.08	5½	18	¾	0.0625
40 by 8 inches.....	0.09	6½	18	¾	0.0625

MARKING, WRAPPING AND PACKING.

See General Specifications.

MATERIAL.

See General Specifications.

(a) CORD MATERIAL shall be of the best quality combed Sea Island or Sakellarides cotton or their physical equivalent as approved.

(b) RUBBER COMPOUND:

	New Rubber Per Cent Volume.
Tread	minimum 32
Side wall	minimum 65
Friction and cushion	minimum 85

TESTS.

See General Specifications.

(a) MEASUREMENTS: Cross-sectional diameter of each tire inflated to recommended weight and load schedule of the S. A. E. shall be:

Size in inches.....	33 by 4	35 by 5	36 by 6	38 by 7	40 by 8
Diameter	4.2	5.4	6.3	7.35	8.4

(b) Tires shall be capable of withstanding water pressure of 350 pounds per square inch without injury.

(c) MINIMUM STRENGTH of the casing (strength factor) is the product of the number of cords per inch measured at the tread at right angles to the cords, multiplied by the strength of the individual cords as taken from the cord casing, multiplied by the number of plies:

Size in inches.....	33 by 4	35 by 5	36 by 6	38 by 7	40 by 8
Strength factor in pounds.....	2,000	2,500	3,000	3,500	4,000

(d) FRICTION:

Strength of union between breaker and tread.....	minimum 32
Strength of union between breaker and cushion.....	minimum 32
Strength of union between side wall and plies.....	minimum 14
Strength of union between cushion and plies.....	minimum 16

(e) RUBBER COMPOUND:

	Tread. Minimum.	Side Wall. Minimum.
Tensile strength	2,400	1,500
Ultimate elongation	2-12	2-11
Set		
Stretch	inches 2-10	2-10
Set	per cent 25	25

(f) ROAD TEST: Manufacturers shall maintain at least two cars used exclusively for test and they average at least 1,000 car miles per car week for sizes 33 by 4 inches and 35 by 5 inches; and 500 car-miles per car week for 36 by 6 inches, 38 by 7 inches, and 40 by 8 inches. A sufficient number of casings (not less than six) for sizes 33 by 4 inches and 35 by 5 inches and not less than four for sizes 36 by 6 inches, 38 by 7 inches, and 40 by 8 inches shall have averaged on the rear wheels at least 5,000 miles.

INSPECTION.

See General Specifications.

PNEUMATIC INNER TUBES (GRAY).

GENERAL.

(a) This specification covers requirements for pneumatic inner tubes of the endless type, except motor cycle tubes, which shall be butt end or endless, as ordered, of the following sizes:

GS 1040	28 by 1½ inches
GS 1041	28 by 1¾ inches
GS 1042	28 by 3 inches
GS 1043	29 by 3½ inches
GS 1044	30 by 3½ inches
GS 1045	31 by 4 inches
GS 1046	33 by 4 inches
GS 1047	35 by 5 inches
GS 1048	36 by 6 inches
GS 1049	38 by 7 inches
GS 1050	40 by 8 inches

(b) See General Specifications for Tires which are a part hereof.

CONSTRUCTION.

(a) GAGES: Tubes shall conform to the following table:

Size.	Medium Pole Inches.	Minimum Thickness.	Minimum Fin- ished Length. Inches.
28 by 1½	1	0.048	27
28 by 1¾	1	0.048	27
28 by 3	1¼	0.052	27
29 by 3½	1½	0.050	28
30 by 3½	1½	0.050	28
31 by 4	1¾	0.055	29
33 by 4	2	0.065	30
35 by 5	2½	0.075	32
36 by 6	3	0.080	34
38 by 7	3½	0.100	36
40 by 8	4	0.120	38

(b) If tube is mold cured, measurements must be equivalent to above as determined by volume, and if larger size poles are used, volume of rubber shall be at least equal to above measurements.

(c) The splice shall be as strong as the rest of the tube under the inflation test.

(d) Each tube shall be properly fitted with one complete Schrader valve or its approved equal, and not leak or tear out under ordinary usage, as follows:

Size.	Schrader's No. Equal.
28 by 1½	1022
28 by 1¾	1022
28 by 3	1022
29 by 3½	1022
30 by 3½	1022
31 by 4	1022
33 by 4	1022
35 by 5	1022
36 by 6	1022
38 by 7	1022
40 by 8	1022

Each valve shall be fitted with lock nut, rim nut, valve cap, and dust cap, with exception for sizes 28 by 3, 29 by 3½, 36 by 6 and over. Spreaders shall be furnished for all sizes up to and including 25 by 5.

MARKING, WRAPPING AND PACKING.

See General Specifications.

Wrapping and packing shall conform to requirements accompanying requests for bids.

MATERIAL.

See General Specifications.

Shall be made from a compound containing 93 per cent by volume (minimum) new rubber; sulphur content shall not exceed 7 per cent and organic acetone extract of the cured compound must not exceed 5½ per cent of the weight of new rubber used.

TESTS.

(a) Rubber compound: Test pieces shall be ¼-inch wide over a gage length of 1 inch, the ends being gradually enlarged to a width of approximately 1 inch, to provide a satisfactory gripping surface.

Ultimate elongation	inches 1-8½
Set	
Stretch	inches 1-6
Set	per cent 10

(b) Each tube shall be tested for leaks by inflating with air and immersing in water.

INSPECTION.

See General Specifications.

Each lot of 1,000 tubes or less shall be tested.

(To be continued.)

TIRE AND AUTOMOBILE "SATURATION POINT" NOT IN SIGHT.

With motor vehicle registrations in the United States well past the seven million mark, certain "croakers" are writing much about the "saturation point" and that other indefinite period when the automotive industries must face "diminishing returns."

W. O. Rutherford, vice-president of The B. F. Goodrich Co., Akron, Ohio, scoffs at such pessimism, however. Automobiles, he points out, come in the "consumption" class of commodities; that is, they are used, worn out and replaced just as clothing is. He forecasts that we shall be able to absorb not only the present automobile production, but shall even sustain the greater growth which ambitious manufacturers are meditating. Continuing, he says:

So far as passenger vehicles are concerned we are now at the crest of a buying market. Production does not equal demand, and personally, I expect this condition to exist for some time to come. I recall being told at one of the New York shows way back in 1907 that the then annual production of 60,000 cars marked the peak point in automobile manufacture and that the number of cars to be made annually would lessen rather than increase. Just as that prophet of gloom was suffering from brainstorm, so will I also classify those who today are refusing to advance with the times. The proposed car production for 1920 is 3,000,000 cars. An analysis of the market, at home and abroad, shows an ability to absorb even greater production, hence the possibility of a shortage of cars is imminent.

Foreign Import Duties on Boots and Shoes.

THE FOLLOWING TABLE, corrected to February 15, 1920, by the Bureau of Foreign and Domestic Commerce, shows the foreign import duties on rubber boots and shoes of all descriptions, imported into the various countries from the United States.

Owing to the frequency of tariff changes the figures and information given in this table should be periodically verified. It

is also advised that small trial shipments be made in order to test the rates prior to sending more extensive shipments.

In the first column is given the country, while the next column contains the articles with notes regarding surtaxes, basis of rates, etc. The third column specifies whether the weight is to be taken as gross or net and the last gives the ad valorem duty or the rate of specific duty in United States currency.

COUNTRIES		ARTICLES AND REMARKS		Weight.	Duty (U. S. Currency).
Austria-Hungary	Shoemakers' wares, with textile goods, per 100 pounds.....	Net			\$11.05
Belgium	Manufactures of india rubber, ad valorem.....	Net			10%
Bulgaria	Ordinary rubber boots and shoes (cashless), per 100 pounds (includes 20 per cent surtax).....	Net			\$10.51
Denmark	Other rubber boots and shoes, per 100 pounds (includes 20 per cent surtax).....	Net			21.01

Foot weights are generally computed, but generally includes the weight of the immediate packing or container, though in some countries fixed rate allwances are made. In Argentina, Bolivia, Paraguay, and Uruguay, the duties are to be computed upon the official valuations at the rates given in the last column.

Foreign Import Duties on Rubber Tires.

THE FOLLOWING TABLE, corrected to February 15, 1920, by the Bureau of Foreign and Domestic Commerce shows the foreign import duties on rubber tires of all descriptions imported into the various countries from the United States.

The column marked "Weight" shows whether duties are levied on net or gross weight, or include simply the inner packings. The next two columns give the rate of the duty for each one hundred pounds in United States currency or the rate per cent ad valorem.

In the following monograph the surtaxes have been included and the converted rates therefore indicate the actual duty payable.

Certain charges, such as warehousing, customs handling, local taxes, revenue stamps, etc., are not included. The rates of duty shown, including the surtaxes as noted, should therefore be regarded as the minima. As changes in duties are likely to occur at any time, frequent verification of these figures is advised.

COUNTRIES.	Weight.	Rate per 100 Pounds, U. S. Currency.	Rate Per Cent—Ad Valorem.

Legal weight is not uniformly construed, but generally includes the weight of the immediate packing or container, though in some countries fixed rate allowances are made.

A Rapid Method for the Determination of Sulphur in Rubber Mixtures.¹

By G. D. Kratz, A. H. Flower and Cole Coolidge.

THIS INVESTIGATION was primarily undertaken in order to find an accurate and rapid method for the determination of sulphur in rubber mixtures, applicable to both vulcanized and unvulcanized samples containing various amounts of sulphur. Further, it was desired that the results obtained should be comparable with those obtained by the well known Carius method, or the fusion method of Waters and Tuttle,² as adopted by the United States Bureau of Standards. Both of the preceding methods, while accurate, involve a somewhat tedious procedure.

CLASSIFICATION OF METHODS.

It will not be necessary to review all of the methods which have been proposed for the determination of sulphur in rubber. Without considering their priority, it will suffice to recall that they can be grouped roughly under three general classifications—direct fusion, solution with electrolytic oxidation and solution, or wet oxidation, with or without subsequent fusion.

Of the direct fusion methods, the use of Eschka's mixture, as proposed by Esch,³ and the zinc oxide-potassium nitrate fusion mixture, proposed by Kaye and Sharp,⁴ are the best known. The former, although quite accurate, is not sufficiently rapid for general analytical work, while the spurting occasioned by the fusion of rubber with zinc oxide and potassium nitrate is a serious objection to the latter.

The electrolytic oxidation method of Gasparini⁵ has been adapted especially for rubber by Hinrichsen⁶ and by Spence and Young.⁷ The latter modification, in particular, gives very satisfactory results, but requires the use of special apparatus, the installation of which is not warranted in all laboratories.

The method of Henriques⁸, however, which involves wet oxidation and subsequent fusion, probably has received the most attention and has been made the subject of the greatest number of modifications, among which is that of Waters and Tuttle. The subsequent fusion of the product of the oxidation with nitric acid

with sodium carbonate-potassium nitrate mixture, however, limits the rapidity with which this determination can be made. Several methods have been devised to avoid the use of a fusion mixture. The best of these have been proposed by Roth,⁹ Stevens,¹⁰ and by Rosenstein-Davies.¹¹ Stevens' method, which has appeared since the results reported in this paper were obtained, has not been compared with our own. It would appear, however, that in it Stevens has modified Roth's method in such a manner that the objections to the latter method, noted by the Netherlands Government Institute, have been largely eliminated. The Rosenstein-Davies method is based, primarily, upon the solution and wet oxidation of the rubber by a nitric acid-bromine water mixture. In order that this oxidation be complete, and the necessity of subsequent fusion be eliminated, it is required that the oxidation be effected at a higher temperature than it is possible to obtain by heating with nitric acid and bromine water alone. To elevate the boiling point, a quantity of arsenic acid is added.

Our experience with the above method has led us to depreciate the use of arsenic acid for the purpose intended. When employed in the recommended quantity (12.5 gms.), it is difficult to remove it entirely from the barium sulphate precipitate. Consequently, in our method, in order to elevate the boiling point, with a substance which can be easily washed free from the final precipitate, we have substituted zinc oxide for arsenic acid. This substitution, while it effects even a higher elevation in the boiling point than is obtained with arsenic acid, has the further advantage of permitting the subsequent fusion being carried to dryness; in the case of the Rosenstein-Davies method, evaporation is continued to syrupy consistency only. Thus, the carrying to dryness, or, as we have termed it, "baking" of the residue, insures a more complete oxidation than is obtained by the above method, and the final oxidation takes place at a temperature far in excess of the boiling point of arsenic acid. After "baking," the residue is taken up in hydrochloric acid, and the zinc is eliminated—as the readily soluble chloride which is easily washed from the barium sulphate precipitate.

In applying our method, we have found the following procedure to give excellent results:

THE METHOD IN DETAIL.

The sample, weighing about 0.5 gm., is cut finely with scissors, or is crumbled on the mill, and transferred to a 500 cc. Erlenmeyer destruction flask (Pyrex glass).¹² Ten cc. of the zinc oxide-nitric acid solution is added and the flask whirled rapidly to thoroughly moisten the sample. If convenient, the mixture may be allowed to stand over night at this point. By so doing the sample becomes partially decomposed, which permits the addition of fuming nitric acid with no danger of ignition of the sample. Fifteen cc. of fuming nitric acid is then added (all at once) and the flask whirled rapidly to keep the sample immersed in the solution in order to avoid ignition by too rapid oxidation.

With certain samples, it may be necessary to cool the flask under a stream of tap water. When the solution of the rubber is complete, five cc. of a saturated water solution of bromine is added and the mixture is evaporated slowly to a foamy syrup.¹⁴ If particles of organic matter remain at the end of the evaporation, a few cc. of fuming nitric acid are added and the solution is reevaporated to the same consistency as before. The flask is then cooled and a few crystals of potassium chlorate are added to assist in the oxidation of the sulphur and the decomposition of any nitrates.

The mixture is then evaporated to dryness over a Tirrill burner, using an asbestos gauze. While in this position, the contents of the flask is baked at the highest temperature of the burner, until all nitrates are decomposed and no more nitrogen peroxide fumes can be detected.¹⁵ When the "baking" is complete, the flask is cooled and the residue taken up with fifty cc. of (1:6) hydrochloric acid and heated until solution is complete.¹⁶ The solution is then filtered, made up to 300 cc., and precipitated with barium chloride in the usual manner, observing the customary precautions. The barium sulphate precipitate is washed with boiling water until no cloudiness results on testing the filtrate with silver nitrate solution.

DISCUSSION OF THE METHOD.

It was desired to employ the minimum quantity of zinc oxide necessary to effect the complete oxidation of the rubber and sulphur. Several preliminary tests were made with different amounts of this substance. Best results were indicated with two gms. of zinc oxide to ten cc. of nitric acid. The use of these quantities was confirmed by the results obtained for the combined sulphur in a rubber mixture which contained 1.903 per cent sulphur, when estimated by the method of Waters and Tuttle.

Sample No.	Grams Zinc Oxide Used.	Combined Sulphur, Per Cent.
292	1	1.712
292	2	1.907

From this, it is evident, that with less than two gms. of zinc oxide the results obtained are apt to be low.

The barium sulphate precipitates obtained by our method were then examined qualitatively for the presence of zinc. The "Rinnmann Green" test for zinc gave negative results, indicating the absence of this substance as an impurity. The true barium sulphate contents of the barium sulphate precipitates obtained by our method were also determined quantitatively in the following manner. The combined sulphur on a sample of rubber was estimated in the usual way. The barium sulphate precipitate so obtained was then fused with one to one sodium carbonate-potassium nitrate mixture, the melt dissolved in water, filtered, acidu-

lated with hydrochloric acid and the sulphates reprecipitated. This determination was carried out in duplicate, and the results are tabulated below. From these results, it is apparent that the difference between the two, when expressed as "per cent sulphur," is negligible, showing that the barium sulphate, as originally precipitated, is practically free from impurities.

Sample	Original Precipitate Barium Sulphate in Grams.	Sulphur, Combined Per Cent.	Fused and Reprecipitated in Grams.	Sulphur, Combined Per Cent.
A	0.0865	2.046	0.0781	1.979
B	0.0801	2.030	0.0781	1.979

The possibility of error from the foregoing sources having been determined and found to be negligible, sulphur estimations were made on several different mixtures. In all instances, unless otherwise stated, the mixture subject to analysis was composed of 92½ parts rubber and 7½ parts sulphur. The condition of the mixture, and the nature of the sulphur (total or combined) was varied according to the experiment.

Our inability to readily obtain satisfactory results for the total sulphur in mixtures composed of rubber and sulphur only, by methods not employing subsequent fusion, led us to first examine mixtures of this type. The total sulphur, as estimated by our method, in both unvulcanized and vulcanized mixtures, was found to be in good agreement with the quantity originally added. In the case of unvulcanized samples, however, we found it best to employ the modification recommended in foot-note 14. Typical results for total sulphurs are tabulated in Table I.

To test the accuracy of our method for the determination of combined sulphur, results obtained by it were compared with similar determinations made by the method of Waters and Tuttle. The results of this comparison are shown in Table II, and are such as to require no comment in regard to them.

TABLE IV.

Sample No.	Mineral Pigment Added to Mixture.	Per Cent Free Sulphur by Bromine Oxidation Method.	Per Cent Combined Sulphur by New Method.	Per Cent Total Sulphur by Addition.	Per Cent Total Sulphur by New Method.
361	Zinc Oxide	2.56	0.493	1.664	2.557
466	Zinc Oxide	2.56	0.740	1.801	2.541
483	Zinc Oxide	3.75	2.486	1.221	3.707
524	Litharge	7.14	7.188

¹² We have found the heavy type Pyrex flask to be remarkably satisfactory at the high temperature at which the baking takes place.

¹³ 200 gms. chemically pure zinc oxide in 1 liter of concentrated chemically pure nitric acid.

¹⁴ For the determination of the total sulphur in unvulcanized mixtures, use 3 cc. of bromine in place of the above quantity of bromine water.

¹⁵ Some care should be used at this point to insure uniform penetration of the heat throughout the contents of the flask, and to remove the flask as soon as the "baking" is complete.

¹⁶ In case the original mixture contains barium salts, they will be precipitated at this point. If litharge is present in the mixture, lead salts, not otherwise removed, will be eliminated in the final washing with boiling water.

The figures shown in the Tables I and II were further substantiated by those recorded in Table III. From this table, it is also evident that satisfactory results may be expected when our method is employed for the determination of combined and total sulphur in conjunction with the bromine oxidation method of the United States Bureau of Standards¹⁷ for the determination of free sulphur.

¹⁷ Circular of United States Bureau of Standards, No. 38, 1915, page 66.

In Table IV we have given a few figures obtained with mixtures which also contained a mineral substance. The results for these mixtures require no comment.

SUMMARY.

Briefly, our method, as herein described, differs from others which eliminate subsequent fusion with sodium carbonate-potassium nitrate mixture, chiefly in the introduction of a process whereby the products of the initial oxidation are "baked" in the presence of zinc oxide. By this means, complete oxidation and the expulsion of oxides of nitrogen are insured. We have found it to be accurate to within 0.1 per cent as compared with the method of Waters and Tuttle. A further advantage which increases both the accuracy of the method and the rapidity of its manipulation is that it does not require the transference of the contents of the flask in which the determination is made until the precipitation of the barium sulphate is to be effected.

We have found that from thirty to fifty determinations can easily be made, by our method, by one man in a week's time. Incidentally, the quantity of nitric acid required is small, in comparison with other methods.

In conclusion, we strongly recommend the determination and subtraction of a blank, to allow for sulphur in the combined reagents employed¹⁸. This applies, not only to our own method, but, likewise, to any other method as well.

In view of the results recorded above, we are warranted in drawing the following conclusions:

CONCLUSIONS.

1. It is possible to obtain complete oxidation by our method of procedure, which involves baking the residue in the presence of zinc oxide.

2. The results obtained by our method for combined sulphur (as compared with those obtained by the method of Waters and Tuttle), or for total sulphur (as compared with the amount added to the mixture), are accurate to within 0.1 per cent.

3. The rapidity and accuracy with which sulphur determinations can be made by our method recommends its use for routine work in the rubber laboratory.

¹⁸ Our experience with a number of different methods, particularly if used to estimate combined sulphur when present in small amount, has caused us to emphasize this point. It is possible that the subtraction of a blank for the reagents used would have lowered considerably the figure (0.18 per cent) obtained by Fol and Van Heurn ("Communications of the Netherlands Government Institute for Advising the Rubber Trade and the Rubber Industry," Part VI, page 184) for the unextractable sulphur in an unvulcanized mixture. With the best obtainable reagents, blanks will run from 0.05 to 0.15 per cent, according to the method and reagents employed. On repeating the work of Fol and Van Heurn, wherein we extracted the unvulcanized mixture with acetone for twenty-four hours, we obtained a combined sulphur of 0.067 per cent after the subtraction of a blank for the reagents.

PLANTATION RUBBER, A FORECAST.

ASSUMING that the acreage planted in rubber will increase at the rate of increase of the years since the war began, which in round numbers is something under 150,000 acres yearly—in the four previous years it was nearly 300,000 acres a year—the average under plantation rubber for 1919 should be 2,900,000 and for 1920 about 3,050,000 acres. It is possible that falling prices may check extension in the countries in British hands, but any such effort will be offset by increased cultivation in the Dutch possessions and in the lands where experimentation with rubber culture, and, above all, with *Hevea*, has been going on scientifically—Borneo, New Guinea, the Philippines, Cochinchina and East and West Africa, British, French and Belgian.

There is an effort to restrict in some degree the indiscriminate collection of rubber, for many reasons and in many ways: by planting fewer trees to the acre and farther apart; by tapping at longer intervals and more sparingly in accordance with the theories of scientific experts, who attribute diseases and other mishaps to the methods of tapping, so that in some places trees are tapped only in alternate years or less frequently, in

others only on some fraction of the circumference, in all somewhat less recklessly and profusely; by arbitrarily abstaining from collecting a portion of the crop in order that the stock on the market may be diminished and prices be kept higher in consequence.

This is offset by the fact that only the first trees planted have come to full maturity, and that the younger trees planted a score of years ago are maturing by hundreds of thousands of acres yearly, each tree able to yield more latex every year. The full impact of the planting begun in Malaya twenty-five years ago has not been felt, and the millions of trees planted in other suitable lands also have yet to come to full maturity. The annual supply of crude rubber must increase largely from natural causes even if not a single new tree were planted.

The increased demand for rubber in the United States is likely to continue for years to come. The 100,000 tons called for in 1915 had increased 50 per cent in 1918 and had gone nearly to the 200,000-ton mark in 1919. While the building of automobiles may reach its limit within a few years, it is not likely that their use will be checked and a steady supply of tires must be inevitably provided for them.

While the rubber supply from Brazil, Africa, and other districts may be looked upon as likely to stay at 60,000 tons at the most, unless modern and improved methods are applied, the production of plantation rubber in the Far East can easily be increased by 50,000 tons yearly, if the demand calls for that amount at a fair price. In all probability the eastern plantations could soon send in much more than that amount of rubber, if any emergency should demand it, unless some disaster to the rubber culture should intervene, like the boll weevil devastation of Sea Island cotton.

PLANTATION RUBBER ACREAGE, PRODUCTION AND WORLD'S PRODUCTION.

Year.	Plantation Acreage.	Plantation Production (tons).	Total, World Production (tons).

DR. SCHAEFFER VICE-PRESIDENT EAGLE-PICHER LEAD CO.

Dr. John A. Schaeffer, chief chemist and metallurgist of the Eagle-Picher Lead Co., at Joplin, Missouri, for nine years past, was made a vice-president of the company at the annual meeting held in Cincinnati, February 17, with headquarters in St. Louis. He will have, in addition to his scientific duties, full charge of all operations of the company's St. Louis district, which includes the plant at Hillsboro, Illinois, where zinc oxide will be manufactured, and the plant of the Hammar Brothers White Lead Co., recently acquired by the Eagle-Picher company.

Before joining the company Dr. Schaeffer was instructor in chemistry at the Carnegie Institute of Technology at Pittsburgh, Pennsylvania; he is a member of the American Institute of Chemical Engineers and the American Chemical Society. R. E. McCormack, formerly purchasing agent and assistant traffic manager at Joplin, will be his assistant. The offices of the Eagle-Picher Lead Co. are now in the Railway Exchange Building, St. Louis, Missouri.

What the Rubber Chemists Are Doing.

IDENTIFYING ARTIFICIAL RUBBERS.

C. HARRIES discusses the possibility of identifying the presence of artificial or synthetic rubbers in a special contribution in "*Gummi-Zeitung*," Volume 33, No. 16, January 17, 1919, page 222,¹ and gives his method in detail.

All previous methods for either qualitative or quantitative examination of rubber substance are incapable of distinguishing which kind of rubber is present because all artificial rubbers yield bromides and nitrosites so similar to those of natural rubber that only by tedious examination can the sources of their derivation be distinguished. The only method available is ozonizing. Even this affords quantitative results only indirectly. First, obtain the rubber substance by the methods hitherto used and then by ozonizing or by separation of the ozonate obtained determine how much of the rubber can be regarded as artificial.

The kinds of artificial rubber to be distinguished are the common isoprene rubber and the so-called carbonate of sodium isoprene rubber. To isolate these products and distinguish them the procedure is as follows:

The watery solution obtained in disintegrating the ozonide is steamed in a vacuum until the residuum is of a syrupy consistency. The aldehydes, diketones and formic acids go off with the steam into the distillation. The residue contains the levulinic acids, the succinic acids, and sometimes also another crystallizing product, the levuline aldehyde diperoxide, to which generally no attention need be given. The succinic acid, if it is present, crystallizes quickly and can be expressed. The levulinic acids distill in a vacuum below 10 to 12 millimeters at a temperature of about 130 to 150 degrees C. and then give, with acetic acid, phenylhydrazine, a well crystallizing hydrazone with a melting point of 108 degrees C.

For the quantitative estimate of the levuline aldehyde the distillation product is mixed with about 5 grams of acetic acid phenylhydrazine and a few cubic centimeters of diluted muriatic acid, when after standing for a day the levuline aldehyde derivative, the phenyl-methyl-dihydro-pyridazine is set free in solid form. This melts, after it has again been decrystallized with alcohol, at 197 degrees C.

To determine the acetylonyl acetone the whole mass is distilled with steam, without first separating the pyridazine. The presence of the muriatic acid turns the biphenyl hydrazine derivative of the acetylonyl acetone, with the casting off of a molecule of phenyl hydrazine, into anilino-dimethyl pyrrol which is converted into crystal flakes of 90 to 92 degrees melting point, while the phenyl-methyl-dihydro-pyridazine remains behind in slabs. From the quantity of the anilidopyrrol which appears, certain inferences may be drawn as to the derivation of the isoprene rubber. If some anilino-dimethyl-pyrrol is found, it is a pretty sure indication of the presence of artificial isoprene rubber.

It is to be noticed, however, that the dimethyl butadiene rubber ozonides when disintegrated with water also yield acetylonyl acetone, namely, normal dimethyl butadiene rubber, in almost an equal quantity, but the converted Kondakow product only 50 per cent of the amount that the theory calls for. With these, however, no succinic acid is found in the residue. Much anilido-dimethyl-pyrrol would point to the presence of the last two materials. If we have clean normal dimethyl butadiene rubber, when its ozonide is separated, we have a watery solution which, mixed with acetic acid phenylhydrazine gives at once a beautiful yellow precipitate of the biphenyl hydrazone of acetylonyl acetone, which, when filtered and weighed, enables us to calculate pretty closely the amount of dimethyl butadiene rubber.

The melting point of the biphenyl hydrazone, decrystallized out of diluted alcohol is, according to Paal around 120 degrees C. Pure dimethyl butadiene rubber is the easiest of all artificial rubbers to detect.

The hardest of the butadiene rubbers to investigate is that whose ozonide in the disintegration yields succinaldehyde. We must proceed in seeking its quality as we do with the isoprene rubbers, namely, steam the watery decomposing fluid in a vacuum. The succinaldehyde passes out with the steam, and gives, when combined with acetic acid phenyl hydrazine, the succinbiphenyl-hydrazone with a melting point of 125 degrees C. This is very decomposable. Treated with diluted muriatic acid it is converted into a solid, white polymeric base, throwing off phenyl-hydrazine which melts at 184 to 185 degrees C.

In mixtures of butadiene rubbers with other kinds of rubber, it is extremely hard to demonstrate the presence of succinbiphenyl hydrazone.

With vulcanized products the procedure would be as follows:

The sample to be investigated in the first place must be freed of sulphur as much as possible. This can be brought about only by rolling the sample thin, wetting the surface, and dissolving it with acetone in a Soxhlet apparatus as long as sulphur is taken up by the solvent. Then, after the extraction has continued for about eight days, the sample is rolled out again and subjected to extraction once more for a like period. The sulphur absorbed only colloiddally is thus pretty nearly all removed, and the samples retain only the sulphur that is chemically combined. This, when treated with ozone, is converted into peculiar sulphur acids bound to carbon; free sulphuric acid is also developed. In order that these, when the ozonide is boiled with water, shall not harden the aldehydes and ketones that are formed, a few grams of precipitated calcium carbonate are added to the water beforehand in order to neutralize it. Then when it is steamed in a vacuum, the aldehydes and ketones pass over into the distillation, the acids partially bound to the calcium (levulinic acids) must be set free and etherized out of the residue by the measured quantity of sulphuric acid, whereupon it may be isolated by redistillation in a vacuum. The individual substance can then be determined as shown above. This method, however, can be used for soft rubbers only and not for hard rubbers.

In conclusion, the author states regarding his method for identifying artificial rubbers that it is still imperfect, but there seems no other possible way at present. The analytical solution of the problem must be accompanied by thorough mechanical tests which presuppose exact knowledge of the physical qualities of the individual materials. During the past few years practical results have been obtained in the identification of series of artificial rubbers submitted for test.

DETERMINATION OF THE SOFTENING POINT OF ASPHALTUM AND OTHER PLASTIC SUBSTANCES.

The following method by D. W. Twiss and E. A. Murphy is from a paper published in the "*Journal of the Society of Chemical Industry*," December 15, 1919, page 405T.

Substances of the asphaltum type are employed widely in chemical industry under various names, such as gilsonite, grahamite, pitch, elaterite, albertite, bitumen, "mineral rubber," and "hydro-carbon," and as the differences in chemical composition are relatively slight, physical tests become of correspondingly greater importance.

The absence of any definite point of fusion renders all the so-called melting-point methods of examination really methods

¹"On the Scientific Principles for Identifying Artificial Rubbers by Technical Analysis."

for the comparison of the tendency to soften with rise of temperature. Probably the method most commonly applied is that of G. Kramer and C. Sarnow, in which a core of the bituminous material in a glass tube is submitted to the pressure of a drop of mercury of definite weight and the temperature is measured at which the mercury forces its way through the material. This method is probably the most satisfactory but possesses some disadvantages for the avoidance of which the arrangement represented in Fig. 1 is very convenient. The apparatus consists of a U-tube *M* one arm of which is connected by capillary tubing with a gun-metal tap *T*. The central plug of this tap, which forms the most important part of the apparatus, has a conical or tapered bore $\frac{1}{4}$ -inch in length and $\frac{1}{8}$ and $1/16$ -inch in diameter, respectively, at the two ends; the bore is terminated at each end by a flat groove (see Fig. 2) to which its axis is perpendicular; the capillary metal tube of the tap is connected with the glass capillary by means of a well sealed metal sleeve.

FIG. 1. TESTING SOFTENING
POINTS OF ASPHALTS.

FIG. 2. DETAILS OF TAP T.

To perform a test the sample of bituminous material and the clean plug of tap *T* are warmed in a steam oven for about 10 minutes so that the material becomes somewhat plastic; a piece of the softened material is then pressed into the wider end of the bore of the warm tap plug, as expeditiously as possible, with a small spatula, until the bore is filled throughout and a little extrudes from the other end; the tap plug is then allowed to cool and the excess of material removed carefully so as to leave the exposed surfaces of the material flush with the metal at the end of the bore. The plug is then refitted into its seating in the barrel, being previously lubricated if necessary with a smear of glycerin. From the principle of the test it is essential that the narrower end of the bore should face downwards and be directly above the free opening of the barrel of the tap. Sufficient mercury is present in the U-tube to reach approximately to the equator of the bulb *A* when the pressure is the same in each limb. Air is then forced gently through the tap *S* until the U-tube, acting as a manometer, indicates an excess internal pressure of $1\frac{1}{2}$ inches of mercury between the two limbs. The tap *S* is then closed, when, if the apparatus is properly fitted, the internal pressure remains constant. On warming the medium in the bath, with the usual precautions, a temperature is finally attained at which the air pressure is sufficient to cause the complete extrusion of the core of bituminous material through the narrower end of the bore of the tap plug; the attainment of this temperature is indicated sharply by the sudden rise of the level of the mercury above *B*, and the reading of the thermometer is recorded as the softening point of the material.

The flat grooves cut at the two ends of the tapered bore of the plug of the tap *T* not only facilitate the filling of the bitumen and enable a considerable degree of accuracy in fixing the length of the bituminous core, but also, at the narrower end, provide a convenient space to receive the extruded bitumen

so that the subsequent removal of the plug from the barrel is possible without difficulty.

The bulbs *A* (diameter approximately $1\frac{1}{4}$ inches) and *B* (diameter approximately $\frac{3}{4}$ inch) are so arranged that any expansion of the air enclosed between *T* and *B*, due to heat received from the bath despite the interposed screen, causes no appreciable alteration in the difference between the mercury levels. The pressure, therefore, is practically constant until the extrusion of the bitumen at the end of the determination. For a second test it is merely necessary to remove the plug of tap *T* and to clean it with a camel-hair brush (or a piece of filter paper) moistened with carbon bisulphate; the apparatus can therefore be kept fitted up ready for immediate use. Any gradual discoloration of the heating medium is of no consequence to the performance of the test. The construction of the tap *T* in metal facilitates the transference of heat to the central core of bitumen and so reduces the "lag" of its temperature behind that recorded by the thermometer. For the heating medium in the bath, glycerin is generally convenient. As the commercial products of the asphalt type have generally been already well mixed when in a fluid condition, the smallness of the sample tested is not detrimental.

The results obtained with the apparatus described above are generally higher than those obtained with the Kramer-Sarnow method, and the essential difference between the two methods of testing the softening is reflected in the fact that, although both methods give concordant results, we have found the difference between the results of the two methods for various materials to range from 5 degrees to 30 degrees C.

In the following table is given the range of the readings obtained with various commercial samples which were tested repeatedly with the described apparatus and by the Kramer-Sarnow method; the first four samples were probably of gilsonite, whilst the fifth was of a coal-tar pitch.

Sample.	Softening Points.	
	Above Extrusion Method, Degrees C.	Kramer-Sarnow Method, Degrees C.
1.....	155-157	138-140
2.....	145-147	127-129
3.....	146-147	124-126
4.....	179-181	148-150
5.....	94-95	87-88

It is evident that the apparatus described above will also be of very considerable utility for the comparison of the softening points of other materials, such as gutta percha, balata, etc., which exhibit a similar gradual softening when heated. The relative behavior of various grades of gutta percha and balata towards heat is of great importance for some purposes. On account of the lack of adhesion between glass and gutta the Kramer-Sarnow method is not satisfactorily applicable, whereas our experiments using the method described above have given clear indication of its trustworthiness for this additional purpose. The significance of the test is manifest from the fact that although consistent results are obtainable with various commercial samples, the softening temperature observed ranged from 101 degrees C. for a sample of washed raw balata, to 190 degrees C. for a commercial sample of so-called "pure gutta." It is essential, however, that the portions used for the test should previously be rendered air-free and dry. In making these experiments the same "head" of mercury was used as was mentioned earlier for asphalt materials, but in the comparative examination of balatas or guttas it might be advisable in some cases to apply a greater pressure.

DR. L. J. H. STADHOUDER HAS DISCOVERED A METHOD OF COAGULATING latex without making use of any coagulating material. Samples of his rubber are being tested scientifically at the Central Rubber Station at Buitenzorg and also at the *Nederland-Indisch Caoutchouc Fabrik* at Bandoeng.

CHEMICAL PATENTS. THE UNITED STATES.

WATERPROOFING COMPOSITION. One gallon neat's-foot oil, eight pounds rubber, one pound tallow, eight ounces beeswax, four ounces resin and one ounce Burgundy pitch. (Daniel Jewett Davies, Pasadena, California. United States patent No. 1,329,162.)

THE DOMINION OF CANADA.

RUBBER RECLAIMING PROCESS comprising simultaneously treating the material to be devulcanized under proper conditions of heat and pressure with a devulcanizing agent comprising xylol and aniline in the proportions of 2½ per cent of aniline and ten per cent of xylol in the presence of a substance capable of combining with or absorbing sulphur. (Firestone Tire & Rubber Co., assignee of John Young, both of Akron, and Winthrop W. Benner, Cuyahoga Falls—all in Ohio, U. S. A. Canadian patent No. 195,875.)

DECORATED RUBBER ARTICLE. The method of making a decorative rubber article by compounding a mass of unvulcanized rubber with a light-sensitive material, forming the compound into the article desired, and subjecting the surface of the article to light rays conforming with the desired design, and then subjecting the article to the action of heat. (The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of Albert A. Somerville, New York City. Canadian patent No. 196,143.)

PAVEMENT COMPOSITION in the form of a block or tile composed of peat, bitumen, marine glue, and slaked lime, transformed by heat to a thick paste and subsequently compressed in a press. (Eugene Audit, Montreal, Quebec, Canada. Canadian patent No. 196,210.)

RUBBER RECLAIMING PROCESS for the separation of cotton fiber or the like from rubber waste which comprises the steps of wetting the waste, passing the waste under a roller and feeding it gradually to a high speed picker whereby the fabric is torn from the waste in the form of threads and fibers and the rubber is torn into small particles, throwing the cotton and rubber together from the picker and separating the cotton from the rubber by blowing the cotton out of its normal course. (The Acushnet Process Co., Inc., New York City, assignee of Philip E. Young, Fair Haven, Massachusetts, U. S. A. Canadian patent No. 196,380.)

RUBBER VULCANIZATION. A process for neutralizing the sulphurous and sulphuric acids and their anhydrous and gaseous forms, generated by the oxidation of the rubber in vulcanized rubber goods having a foundation of fabric, immediately after dry vulcanization is finished and before the goods have cooled, which consists in subjecting the goods to a suitable heat and treating them in an hermetically sealed chamber with undiluted ammonia gas under pressure.

Another claim covers associating with the components of the goods, ingredients which are capable of emitting a gaseous reagent which has a strong neutralizing activity but no prejudicial effect on fabric, rubber, or process of vulcanization. (William Edgar Muntz, London, England. Canadian patent No. 196,564.)

THE FRENCH REPUBLIC.

ACCELERATION OF VULCANIZATION. A process for accelerating the vulcanization of rubber. J. F. B. Van Hasselt. (French patent No. 495,284.)

VULCANIZING RUBBER. A process for vulcanizing rubber and similar substances, and the product resulting from it. The North British Rubber Co., Limited. (French patent No. 496,220.)

VULCANIZING RUBBER. Improved method of vulcanizing rubber and similar substances. (The Dunlop Rubber Co., Limited, Birmingham, England. French patent No. 497,327.)

LABORATORY APPARATUS. ELECTRICALLY HEATED COMBUSTION TUBES.

A COMBUSTION tube that is heated electrically has been designed by C. B. Clark, as shown in the accompany illustration.

ELECTRICAL COMBUSTION TUBE.

of platinum wire, insulated by fire clay and cement and provided with copper terminals.

The tube is of porcelain 24 inches long and 0.4-inch internal diameter. The heating element consists of a coil

INSTRUMENT FOR DETERMINING YARN NUMBER AND WEIGHT OF COTTON CLOTH.

The accompanying illustration shows a device known as a yarn and cloth quadrant, designed for accurately and conveniently determining the number of cotton yarn and the weight of cotton cloth.

Numbers of yarns from one to ten are determined by placing on hook *B* of the quadrant 40 lengths of either warp or filling yarn, drawn from a sample cut to the size of a template accompanying the instrument; the pointer will immediately indicate the number of the yarn, on the lower "4-yard scale." For numbers from ten to 100, hook *A* is used.

YARN AND CLOTH QUADRANT.

The weight of cloth in yards to the pound and the percentage of size in cloth can also be readily ascertained by this instrument. (Charles Lowinson, Inc., 366 Fifth avenue, New York.)

PIPETTE USED IN TITRATION OF OILS FOR ACIDITY.

The pipette illustrated is described by J. Jacobsen, Aarhus Oliefabrik, Aarhus, Denmark, in "The Journal of Industrial and Engineering Chemistry," August, 1918.

The oil to be examined is drawn, by means of the rubber bulb *a*, into the lower tube, which has a capacity of 5.5 cc., equivalent to 5 grams of oil. The cock is turned and the upper tube is filled with a suitable quantity (10 cc.) of a mixture of ether and methylated spirit, conveniently taken from a tubulated bottle, *b*, which is located just above the pipette. Then the cock is turned again and the oil, followed by the ether-alcohol mixture, is run into a flask and titrated with alkali. In that way the lower tube is cleaned out automatically and is at once ready for a new sample.

TITRATION PIPEPTE.

DIXIE CLAY.

A new compounding ingredient notable for its wear-resisting quality is being offered to manufacturers of tires, footwear, hard rubber, and mechanical rubber goods. It is light in color, mills easily and calenders well in high tensile compounds. (R. T. Vanderbilt Co., Inc., 50 East 42nd street, New York City.)

New Machines and Appliances.

MACHINE FOR CALCULATING FABRIC WASTE IN FOOTWEAR MANUFACTURE.

FIGURING waste percentages on fabric cutting in the rubber shoe industry is a problem which has increased in importance with the rise in price of all kinds of cloth. The method most widely used is to weigh the waste and compute the percentage by either weighing the table of stock before cutting or the cut stock after each performance. The machine here shown has solved this problem for both the leather shoe and the canvas shoe manufacturer. The method involved differs in that it figures in terms of square feet instead of pounds.

To install the service, the manufacturer first sends a model size of each pattern or die, such as men's quarter, size 8, boys'

THE KRIPPENDORF CALCULATOR.

lining, size 5, misses cloth heel, size 13-2, to the laboratory of the machine company for survey. The result of this survey is a pattern value or index which, when computed on the Calculator, will tell exactly the number of square feet of stock needed to cut out the required number of pairs at the best percentage of waste.

To operate the machine, the pattern value for the model size is set on the indicator. Supposing the ticket to be cut is 36 pairs: 3 pairs, size 6; 4 pairs, size $5\frac{1}{2}$; 5 pairs, size 5; 6 pairs, size $4\frac{1}{2}$; 5 pairs, size 4; 6 pairs, size $3\frac{1}{2}$; 4 pairs, size 3; 3 pairs, size $2\frac{1}{2}$. These sizes and pairs are recorded on the cylindrical dial, the width is set on the scale near the base of the machine, and the answer is found in the center— $5\frac{3}{4}$ square feet. This gives the cutter an accurate goal. He knows that this is the best possible performance.

In cutting leather the general policy is to grade down from the best possible, giving a scale of 8 or 9 performances, leaving it to the manufacturer to decide at which performance he will begin to pay bonus. Leather is so irregular in shape and the quality of different parts of the hides is so varied, that this wide latitude is necessary.

In cutting rubber or canvas duck a scale of 3 or 4 performances is sufficient. The tables of stock are generally uniform in width and length. This makes it desirable to transpose the square feet answer into running feet. Thus, if it requires 51 square feet of stock to cut 36 pairs of vamps, and the tables of stock are 15 feet long and 3 feet wide, it will take 17 running feet of stock or one table and a fraction. The fact that the stocks are laid from 20 to 40 plies in thickness does not complicate matters. The number of pairs in each cut can be easily computed.

There are several advantages of this system over the present methods used in rubber shoe cutting rooms. It eliminates the

weighing of waste, stock, and cut stock, all of which takes time and therefore costs money. The only additional equipment it requires is the making of each cutter's table into a scale of feet. A cost clerk can thus very easily complete the cutting record after each performance without moving the stock from the cutters' table. The cost accountant has a reliable figure as to how much stock it takes, including the waste which must go into the cost of the shoe, to cut a pair of every pattern used in all goods from light gum shoes to boots and heavy gaiters. The cutter who has difficult patterns which do not fit or dovetail together well, knows the limits of his patterns, and is not penalized because his percentages are not as low as the cutter who cuts insoles or some oblong shape patterns. The machine is double, thus enabling two patterns to be figured together such as toe tips and fillers.

Another advantage of the Calculator is that it enables the planning department to figure exactly how many running feet of stock the mill room needs to run for each day's ticket. This avoids surplus rolls in the stock room and means less money tied up in unfinished material. (Krippendorf Calculator Co., Lynn, Massachusetts.)

SAFETY MOTOR STARTERS.

As a safety measure, motor starters should be completely enclosed to protect workmen from coming in contact with live parts. The two safety starters of the enclosed type here shown are therefore of interest.

The first is the familiar type of direct-current face-plate starter enclosed in a sheet metal case having an external lever which engages the movable arm of the starter. The external or operating lever is insulated from the revolving contact arm by a block of molded insulation. A pointer on the lever and legends stamped on the cover indicate whether the starter is "off" or "on." In the smallest size of starter a knob of black insulating composition is provided in place of the operating lever. A low-voltage release coil in series with the shunt field protects the motor in case of voltage failure or if the field should be opened while the motor is running. The armature resistor is completely enclosed in the starter case, which is kept well ventilated by a flue in the top.

This starter is used with direct-current motors up to 50 h.p., operating at 115, 230 and 500 volts.

OPEN.

CLOSED.

FACE PLATE ENCLOSED MOTOR STARTER.

The second is an automatic motor starter panel of the counter-E. M. F. type completely enclosed in a cast iron case with a hinged cover. The automatic feature is obtained by an accelerating contactor which closes when the motor attains about three-fourths full speed, and automatically shunts out the starting resistor. A magnetic main line contactor mounted on the panel allows remote control from two push-button switches of the momentary contact type.

When remote control is not desired the magnetic main line

contactor is omitted, and the motor is started by a fused knife switch mounted on the panel with an operating handle outside of the case. The handle can be locked in the open position to

OPEN.

CLOSED.

AUTOMATIC ENCLOSED MOTOR STARTER OPERATED BY HANDLE OR PUSH-BUTTONS.

prevent unauthorized operation. Interlocks prevent lifting the cover while the switch is closed or throwing the switch with the cover opened. This starter is for use with small direct-current motors not rated over 2 h.-p. at 115 volts or 3 h.-p. at 230 volts. (The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin.)

HYDRAULIC ACCUMULATOR SYSTEM.

The illustration shows a type of hydraulic accumulator installation that is representative of those in use in up-to-date rubber factories. It is a high and low pressure hydraulic accumulator and intensifier system that is automatic in operation and furnishes both high and low pressure to a battery of hydraulic presses without attention from the operators other than the manipulation of the regular press operating valves.

The high and low pressure triplex hydraulic pumps that furnish the water supply against the pressure of the accumulators are motor driven. Each pump is automatically controlled from an electric switchboard which stops the pump when the accumulator load is raised to a predetermined point and again starts it when the accumulator recedes below this point.

This system has the capacity for developing any pressure from 850 to 10,000 pounds per square inch. (The Hydraulic Press Manufacturing Co., Miami Gilead, Ohio.)

HYDRAULIC ACCUMULATOR

MACHINE FOR MAKING BIAS FABRICS.

Cotton and silk cloth of ordinary square-woven type in which the warp and filler threads are at right angles, may be converted into bias fabrics on the machine here shown. The warp threads

remain in their original position but the fillers are inclined at an angle other than 90 degrees to the warp. This is effected by two series of interconnected grippers that grip the fabric edges and being mounted on endless chains, one of which is retarded, the filler threads, while remaining parallel, are drawn into an angular position with regard to the warp; the width of the web being slightly reduced.

The bias web thus produced is impregnated with rubber solution on a spreader, after which two plies are superposed with the bias threads at opposite angles and united by passing through pressure rollers of a doubling machine. The result is a strong, non-raveling bias fabric suitable for the manufacture of rain-

BIAS FABRIC MACHINE.

coats, auto fabrics, imitation leather, mechanical goods, and possibly, tire fabrics. (Albert Herzog, 118 East 25th Street, New York.)

A FLEXIBLE COUPLING FOR MILL LINES.

This coupling is designed for use on shafts where absolute rigidity is not desired and a certain amount of flexibility is required. The device consists of two sprockets rigidly fixed to the ends of the shafts to be connected. An endless chain encircles these sprockets, thereby coupling the ends of the shafts but affording sufficient lateral play to accommodate ordinary differences in shaft alignment.

The smallest coupling of this type transmits less than one-quarter of a horse-power, while the largest weighs three-quarters of a ton and transmits 3200 horse-power. (I. H. Dexter Co., Goshen, New York.)

CLARK FLEXIBLE COUPLING.

A SAFETY INTERLOCKING NUT AND BOLT.

This is a bolt with a nut that it is said will stay locked under all conditions and may be easily unlocked if required. The principle of construction may be seen in the accompanying illustrations. The washer has two extending inner lugs which slide in two lateral grooves extending the full length of the threaded portion of the bolt. The nut, which in the hexagon type has three or in the square nut, four recesses or chucks

formed in the base, is then applied and brought home to the desired point of contact and the washer upset or bent into the

STEVENSON SAFETY BOLT AND NUT.

recess by means of a cape chisel and a hammer blow. For releasing, the upsetting operation is reversed, the same washer being used repeatedly. (The Safety Nut & Bolt Co., 1836 Euclid avenue, Cleveland, Ohio.)

MACHINERY PATENTS. CORD COVERING AND CORD FABRIC MACHINE.

STRANDS of fabric are covered with rubber and strand fabric for making cord tires is produced on this machine by the calender method, and without crushing or distorting the strands.

CORD FABRIC MACHINE.

A series of bobbins 1, 1, supply the strands 2, that are aligned by comb 3, and grooved roller 4. In passing between the calender rolls, the strands are enclosed, without pressure, between two sheets of

rubber, one from the calender roll A, and the other from stock roller 10.

The sheet is thus passed between fluted pressure rollers 13 and 14 that embed the individual strands in the rubber without flattening them, and the completed fabric is then wound up on drum 17 with a liner from drum 18. (Melvon A. Marquette, Springfield, assignor to The Fisk Rubber Co., Chicopee Falls, both in Massachusetts. United States patent No. 1,321,223.)

HOSE MAKING MACHINE.

As shown in the horizontal sectional view, this is a two-screw forcing machine for coating hose with rubber.

TWO-SCREW FORCING MACHINE.

In the operation the rubber from the pockets 3 is forced into the die at diametrically opposite sides of the tube H. It flows in both directions about the guide 19 as it moves through the die to the opening 17. Rubber from one screw pocket passes upwardly about the guide 19 while other rubber from the same pocket passes downwardly about the guide. These two bodies of rubber meet corresponding bodies from the second screw pocket at a point substantially midway and, due partly to the reducing diameter of the die and partly to the churning, or agitating, action of the closely juxtaposed screws, the joint between the meeting bodies becomes more or less kneaded. A homogeneous union and an even density is thus secured as the joining bodies are forced out through the opening 17.

The disposition of the screw pockets at an acute angle relative to the line of feed of the tube H enables the rubber to move toward and through the opening 17 without material change in its general direction of travel. This also increases the efficiency of the device and provides a structure in which no packing is required between any of the moving parts. (John M. Oden, Brooklyn, New York. United States patent No. 1,322,464.)

New Goods and Specialties.

A GLOVE THAT GRIPS.

A PATENTED GLOVE suitable for automobile driving and other uses where it is essential that a firm grip be secured is illustrated in the accompanying picture. It is made of canvas or other fabric, to which is vulcanized a thin membrane of rubber in any form desired. The illustration shows a series of circular gripping surfaces provided on the glove, one large one on the palm and other smaller ones at intervals on the fingers and thumb. These rubber surfaces are ribbed to produce a somewhat roughened contact. The glove may be made with the back open for hot-weather wear. The same idea is also not limited to gloves, but is applicable to mittens as well. (Joseph M. Reynolds, Atlantic, Iowa.)

RUBBER GRIP GLOVE.

TO PROTECT SHOE TOES.

An ingenious device for the protection of the toes of the shoes of bootblacks, chauffeurs, or other persons whose work entails wear on that portion of the shoes, is illustrated herewith.

The cap or crown is formed of rubber vulcanized to a fabric foundation and having the edges turned inward under the sole. Beneath the sole is a piece of woven wire with the edges turned upward and embedded in the rubber. This layer of wire is covered on the outside with rubberized cloth and on the inside with a layer of rubber. The device is held in place by straps which connect with each other and buckle, one around the foot and one from beneath the arch back of the ankle. (Anthony S. Stebor, Jr., 914 George street, Plainfield, New Jersey.)

SHOE PROTECTOR.

A RUGGED CORD TIRE.

The Castle cord tire recently developed, of which a photograph is reproduced herewith, strives for perfection of type coupled with a practical non-skid tread of rugged design.

CASTLE CORD TIRE.

This tire is the combined result of research and experience in tire manufacturing, with the idea of producing a tire of balanced quality. (New Castle Rubber Co., New Castle, Pennsylvania.)

TWO NEW GOLF BALLS.

Those who follow the offerings of the sporting goods dealers to the devotees of golf will be interested in two new dimpled golf balls recently put on the market. They are known as the Eagle No. 1 and No. 2. No. 1 is high-powered, small and heavy, being 1.63 inches in diameter and weighing 1.64 ounces. No. 2 is light and soft, is 1.655 inches in diameter, and weighs the same as No. 1, being intended for the average golfer who should not attempt too much weight. (A. J. Reach & Co., Philadelphia, Pennsylvania.)

A RED RUBBER FAN BELT.

A new red rubber belt for the operation of automobile fans has just been put on the market under the name of "Samson." It is made in various sizes to fit practically all cars made or used in Canada, and is put up in boxes containing six of a size, with a label stating the size and the makes of cars which the belt will fit, thus enabling the dealer to lay his hand at any time on any size of belt required for a particular make of car. This belt, it is claimed, will withstand severe tests, one having comprised soaking in cylinder oil for 500 hours at one time. This was done to demonstrate that the tensile strength of the belt is greater than would ever be actually required. (Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario, Canada.)

"SAMSON" FAN BELT.

A NEW DUST CAP FOR TIRE VALVES.

A new dust cap for tire valves, known as the "Kwik-on-an-Off," slips over the valve stem and locks with one turn. It remains securely fastened until it is necessary to remove it, when a slight turn in the reverse direction disengages it and permits easy removal. The mechanism is patented and consists of a one-piece shell enclosing a friction spring which fits into the tapered portion of the cap and contracts to grip the threads of the valve stem. (A. Schrader's Son, Inc., 783 Atlantic avenue, Brooklyn, N. Y.)

"KWIK-ON-AN-OFF" DUST CAP.

AN ENDLESS AIR BAG.

The gray endless air bag pictured here prevents damage or marks, it is claimed, to fabric when placed inside tires during vulcanization of retread or recover. A smooth, even pressure is insured to every part of the tire, and separation and blister-

FIRESTONE AIR BAG.

ing are avoided. The bag is of tough, high-grade fabric, coated with a special rubber friction not easily affected by heat. (Firestone Tire & Rubber Co., Firestone Park, Akron, Ohio.)

A RUBBER GLOVE WITH KNUCKLES.

Surgeons' gloves are now made with allowance for the knuckles, thus, it is claimed, preserving the "cuticle touch" in all its sensitiveness and acuteness at the same time that a perfect-fitting sanitary hand covering is provided. These "KnukliT"

SURGEON'S "KNUKLI-T" RUBBER GLOVE.

gloves give free and easy finger action, free circulation of the blood, and eliminate tension on the finger tips. Oversize gloves are no longer required, with their awkward wrinkles and folds. It is also claimed for these gloves that they retain their shape and may be sterilized more times than most other rubber gloves. (The Lincoln Rubber Co., Akron Ohio.)

A REINFORCED BLOW-OUT PATCH.

A new kind of blow-out patch is constructed with a layer of wire mesh inserted in the center, embedded in a layer of cushion stock that is vulcanized to fabric on each side. This permits flexibility without separation, while the wire insert resists pressure evenly and affords protection to any rupture in the tire casing. It extends to within three-quarters of an inch of each edge with at least five plies of fabric covering the wire completely. This patch contains from five to nine plies of high-grade fabric, the number being determined by the size.

"DURA-BUL" WIRE-KNIT BLOW-OUT PATCH AND "EASY-ON" HOLDER.

With these patches is used the "Easy-On" holder, which hooks them around the casing and holds them securely to the sidewall while putting on. The holder is removed after inflation. (Durham Manufacturing Co., 1518 Grand avenue, Kansas City, Missouri.)

PNEUMATIC LIFE SAVING GARMENT.

A convenient inflatable garment intended to be used as a life-preserver is shown in the accompanying photograph. This garment, however, may be worn underneath or over the clothing, as desired. Three seconds is said to be sufficient time for inflating, and, as the garment weighs only ten and one-half ounces and folds up compactly when not inflated, the whole may be carried in the coat pocket.

When desired, this garment can be fitted into coats, vests, bathing suits, knitted sweaters and jerseys, or any other wearing apparel.

The inner tube of the Griffin pneumatic life-saving garment is of rubber, and it is claimed that the speedy inflation valve took three years to perfect. (The Griffin Manufacturing Co., 113 State street, Boston, Massachusetts.)

GRIFFIN PNEUMATIC LIFE-SAYER.

RUBBER SPLICE INSULATOR.

A new kind of insulator for electrical splicing is explained by the accompanying drawing. It consists of a small rubber cap, long and narrow, with an enlarged mouth which permits it to be stretched over end-splices at outlets, in junction boxes and the various fittings of conduit, cable and metal molding work, on terminal splices in motor leads and on splices in fixtures. The use of this device is said to eliminate grounding and entirely prevent short-circuits at end-splices in outlet boxes, etc.

Besides, it smoothly covers the rough surfaces of soldered splices and saves time and labor in applying. "Elasticaps"

"ELASTICAP" ELECTRICAL INSULATOR.

now come in one size, but a larger size is planned to accommodate larger splices such as three No. 14 wires or two No. 10 wires spliced, etc. (The Elasticap Co., Hoboken, New Jersey.)

AN AUTOMATIC SAFETY TIRE VALVE.

An automatic safety tire valve that "whistles" when it's had enough" air has a large hole through the valve stem, from end to end. The inside or check valve seats on top of the stem and is held securely in place, making an airtight seal by the joining of the stem with the pressure regulator. When sufficient air has been pumped into the tire, a whistle announces the fact, from which the name of the device is derived—the "Whistler." (The Automatic Safety Tire Valve Corp., 1765 Broadway, New York City.)

**VALVES AND SQUAWKER ENDS FOR TOY BALLOONS.**

Two new valves for toy balloons, on which applications for patents have been made, consist in the main of perforated metal caps, within which are positioned disks of paper. One has three inward-turning tabs, enclosing two disks. (E. J. Dunbar Co., 28 West 22d street, New York City.) The other has a tri-perforated metal insert, enclosing a single disk. (Howe Baumann Balloon Co., 187 Murray street, New York City.)

New squawker ends for toy balloons, turned from wood, slightly ribbed for ornament, and varnished lightly, include two general forms. One has a simple flange over which to fasten the balloon and the other, in addition to the flange, has a groove in which the fastening may lie. (Novelty Turning Co., Norway, Me.)

**"PARCO" INNER TIRE.**

The inner tire shown here is of sponge rubber to replace the usual pneumatic tube. In this case it is shaped and enclosed in fabric. The "Parco" inner tire comes in different sizes to fit all makes of standard size casings. (The Pan-American Rubber Co., Watertown, Wisconsin.)

"PARCO" INNER TIRE.

Activities of The Rubber Association of America.

ASSOCIATION MEETINGS.

THE REGULAR MONTHLY MEETINGS of the Executive Committees of the Foreign Trade Division, Mechanical Rubber Goods Division, Tire Manufacturers' Division and the Industrial Relations Committee were held during February, but the matters handled were of a routine nature.

TRAFFIC COMMITTEE.

The Traffic Committee is handling with the United States Railroad Administration several matters of importance to the industry, and particularly the application to the Consolidated Classification Committee at Chicago for reduced carload ratings on guayule rubber and the less carload and carload rates on rubber compounds. The Traffic Committee was given a special hearing at Chicago on Friday, February 20, and a favorable decision is expected.

There is now pending before the same committee an application for a reduction from one and one-half times first class to first class on pneumatic tires in less carloads on all kinds of packages, which is a very important subject to the tire manufacturing industry. The application is predicated to a certain extent upon the greatly increased use of paper for the wrapping of tires.

An application is now before the Western Classification Committee at Chicago for a reduction in the ratings on crude rubber from first class L. C. L. to second-class, and from second-class C. L. to fourth class.

An application to the Consolidated Classification Committee is being prepared for the establishment of a rule permitting the mixing of mechanical rubber goods and other general lines of rubber goods in carloads, on the basis of third-class, carload minimum weight thirty thousand pounds. If this application is granted it will have the effect of permitting jobbers to secure complete stocks of goods at a considerable reduction in the present rate and will enable them to order more advantageously.

A recent accomplishment of the Traffic Committee was to secure the adoption in the Virginia State Classification of a provision for the acceptance of pneumatic tires in wrapped bales or bundles. Heretofore the classification was restricted to tires when shipped in crates.

An application will be submitted to the Consolidated Classification Committee for a more flexible provision in the specifications for rubber hose, which will not be so restrictive as to the kind of paper to be used for wrapping hose.

There will be filed shortly with the State Public Utilities Commission of Illinois an application for a reduction in the carload rating on rubber footwear for movement between points in the State of Illinois or points governed by the Illinois State Classification. The present classification provides for first class on this commodity in any quantity and the application asks for a reduction in carload rates to second class minimum, carload weight twenty thousand pounds, the same as applicable in intrastate movements.

ELECTION OF MEMBERS.

The following new members of the Association were elected during the last few weeks:

FIRM MEMBERS.

Ames Holden Tire Co., Limited, Montreal, Quebec, Canada. Firm representative, Talmon H. Rieder.

Emery Manufacturing Co., 43 Main street, Bradford, Pennsylvania. Firm representative, W. A. McCafferty.

Rotary Tire & Rubber Co., Zanesville, Ohio. Firm representative, Edward O. Sterns.

Universal Tire & Rubber Co., San Francisco, California. Firm representative, George M. Stevens.

Duffy & Sears, 133 Front street, New York City. Firm representative, Stephen H. Sears.

Thornett & Fehr, Inc., 66 Broadway, New York City. Firm representative, Henry G. Perry.

Syracuse Rubber Co., Inc., Syracuse, New York. Firm representative, G. R. Loggie.

Trent Rubber Co., Trenton, New Jersey. Firm representative, Henry A. Ludeke.

Hardy & MacArthur, 82 Beaver street, New York City. Firm representative, R. S. Hardy.

Parker Tire & Rubber Co., Indianapolis, Indiana. Firm representative, Paul P. Parker.

Osborn Engineering Co., Cleveland, Ohio. Firm representative, B. L. Green.

ASSOCIATE MEMBERS.

Herbert L. Baxter, Hood Rubber Co.

Robert L. Tonner, Hood Rubber Co.

Robert Muir, Hood Rubber Co.

Robert S. Quinby, Hood Rubber Co.

Edmund S. Kochersperger, Hood Rubber Co.

W. B. Wiegand, Ames Holden Tire Co., Limited.

Claude M. Butler, Syracuse Rubber Co.

William E. Greer, Syracuse Rubber Co.

STANDING COMMITTEES FOR 1920-1921.

NOMINATING COMMITTEE.

The following committees have been appointed by the Executive Committee of the Association:

Harvey S. Firestone, Firestone Tire & Rubber Co.

George B. Hodgman, Hodgman Rubber Co.

Bertram G. Work, The B. F. Goodrich Co.

Frederic C. Hood, Hood Rubber Co.

Henry C. Pearson, THE INDIA RUBBER WORLD.

SPECIAL JOINT EXCISE TAX COMMITTEE.

Charles Neave, chairman.

Kennedy M. Thompson, United States Rubber Co.

F. C. VanCleaf, The B. F. Goodrich Co.

Bernard M. Robinson, Firestone Tire & Rubber Co.

C. L. Landon, The Goodyear Tire & Rubber Co.

W. B. Stratton, The Fisk Rubber Co.

J. C. Weston, Ajax Rubber Co., Inc.

F. I. Reynolds, Empire Rubber & Tire Corp.

A. A. Garthwaite, Lee Rubber & Tire Co.

W. E. Pouse, General Tire & Rubber Co.

E. S. Hochersperger, Hood Tire Co.

Herbert H. Maas, Ajax Rubber Co., Inc.

STATISTICAL COMMITTEE.

R. S. Butler, United States Rubber Co.

W. C. Arthur, The B. F. Goodrich Co.

E. M. Bogardus, The Fisk Rubber Co.

LEGISLATIVE COMMITTEE.

Charles Neave, chairman, general counsel of The Rubber Association of America, Inc.

F. C. VanCleaf, The B. F. Goodrich Co.

Ernest Hopkinson, United States Rubber Co.

AUDITING COMMITTEE.

F. A. Seaman, Kelly-Springfield Tire Co.

W. J. Kelly, Pool & Kelly.

ARBITRATION COMMITTEE.

Horace DeLisser, chairman, Ajax Rubber Co., Inc.

Andrew H. Brown, Meyer & Brown, Inc.

George A. Ludington, The Fisk Rubber Co.
 Van R. Cartmell, Kelly-Springfield Tire Co.
 A. B. Jones, The B. F. Goodrich Co.
 J. T. Johnstone, J. T. Johnstone & Co., Inc.
 W. T. Baird, Rubber Trading Co.
 Homer E. Sawyer, ex-officio, United States Rubber Co.

BANQUET COMMITTEE.

Horace DeLisser, chairman, Ajax Rubber Co., Inc.
 A. W. Warren, Hodgman Rubber Co.
 C. W. McLaughlin, Mohawk Rubber Co.

OUTING COMMITTEE.

A. H. Brown, chairman, Meyer & Brown, Inc.
 G. A. Ludington, The Fisk Rubber Co.
 W. O'Neil, General Tire & Rubber Co.

SPECIAL COMMITTEE ON UNIFORM CRUDE RUBBER CONTRACT AND NOMENCLATURE.

Col. H. Stuart Hotchkiss, chairman, United States Rubber Plantations, Inc.

W. E. Bruyn, L. Littlejohn & Co., Inc.
 George B. Hodgman, Hodgman Rubber Co.
 Frederic C. Hood, Hood Rubber Co.
 W. J. Kelly, Poel & Kelly.
 Paul W. Litchfield, The Goodyear Tire & Rubber Co.
 Charles T. Wilson, Charles T. Wilson Co., Inc.
 Homer E. Sawyer, ex-officio, United States Rubber Co.

COMMITTEE ON RUBBER AND KINDRED PRODUCTS.

Charles T. Wilson, Charles T. Wilson Co., Inc.
 George B. Hodgman, Hodgman Rubber Co.
 Homer E. Sawyer, United States Rubber Co.
 Bertram G. Work, The B. F. Goodrich Co.
 Col. H. Stuart Hotchkiss, United States Rubber Plantations, Inc.

W. J. Kelly, Poel & Kelly.
 E. H. Huxley, United States Rubber Export Co., Limited.
 E. H. Broadwell, The Fisk Rubber Co.
 W. E. Bruyn, L. Littlejohn & Co., Inc.

INDUSTRIAL RELATIONS COMMITTEE.

NEW YORK, FEBRUARY 18, 1920.

To firm and affiliated members:

Referring to our two letters of December 26, respecting the Industrial Relations Committee, particularly our letter asking information respecting industrial relations organizations now functioning in the organizations of all members:

The replies received to our inquiry were very gratifying and indicate clearly to your committee that there is a real opportunity in the industry for cooperative work of this nature and particularly for a medium through which ideas may be exchanged, information given respecting new developments, and assistance offered and supplied wherever required.

The interest in this work indicated by communications received in response to our letter of inquiry prompts your committee to make a further statement of purpose with respect to its work, and to adopt working principles that shall constantly remind the committee and members of the high standard we hope to attain.

As representatives of the rubber industry of the United States and Canada, we are sure, in so far as our relations with our employees are concerned, that our house is in order?

The rubber industry to-day ranks among the largest industries in the country and its place in industrial life is becoming more important each year. Your association wishes to cooperate with you in adopting industrial relations policies that will make the rubber industry the best in the country for all those whose livelihood depends upon it. This large and rapidly growing industry may well bend its efforts toward working out the proper relations between employer and employee with happiness and contentment of worker and management as the outstanding objective. If such a condition is created in our industry it will be a very positive factor in removing causes which result in industrial unrest throughout the whole country and will set a very wholesome example to all other employers.

Let us adopt for our slogan, "THE RUBBER INDUSTRY FOREMOST IN INDUSTRIAL RELATIONS."

The results which we are endeavoring to accomplish can come

only through the sincere interest and cooperation of every member of the Rubber Association and it is expected that on such an important matter every member will aid in the work of the Industrial Relations Committee by sending in subjects for discussion, investigation and report.

The maintenance of harmonious and helpful industrial relations ranks in importance with production, distribution, finance and other important functions of management. This is just as true of the small concern as it is of the large one.

Believing in this as a fundamental, your Industrial Relations Committee, desiring to serve your interests, asks you to advise us on the attached return postcard, the name of the official of your organization who supervises or who will supervise this important work, an executive with whom we may correspond on these matters.

A. L. VILES, General Manager.

THE OBITUARY RECORD.

SECRETARY OF AN OLD TRENTON RUBBER COMPANY.

ALFRED WHITEHEAD, secretary and general manager of the Whitehead Brothers Rubber Co., Trenton, New Jersey, died of pneumonia February 3, 1920, at his home, 16 Perdicaris avenue, Trenton, aged 67 years.

ALFRED WHITEHEAD.

Son of the late John and Martha Whitehead, Alfred Whitehead was born in 1853 in the Whitehead farmhouse on Whitehead's Road, where he lived most of his life. His parents died during his childhood and he was brought up by his uncle. Upon completing his elementary education in the country schools, he went to work, at the age of sixteen, in the Whitehead Brothers' rubber factory, then conducted by his uncle and other relatives, but formerly owned by his father. From a minor position he elevated himself to the management of the plant and was admitted as a member of the firm when the business was incorporated in 1892, later being elected secretary.

He was a director of the Trenton Banking Co., a trustee of the Fourth Presbyterian Church, a member of the advisory board of the Union Industrial Home, and a trustee of the Y. M. C. A. He contributed liberally to charitable institutions and the various war drives held in Trenton. In 1919 he was chairman of the Trenton rubber manufacturers' Salvation Army drive.

In addition to his wife, Pauline W. Whitehead, he is survived by two brothers, Horace and John, and a twin sister, Agnes Whitehead, who is a missionary in India. Interment was in the family plot in Trenton.

FOUNDER OF THE DIAMOND RUBBER CO.

Although Ohio Columbus Barber is best known as the "Match King" and the chief energies of his very active life were devoted, first to the successful development of his own match factory in Akron, Ohio, and later to the amalgamation of the match business in the United States and the English-speaking world, it was almost inevitable that he should take a deep interest in rubber also, should help develop that industry from almost the beginning of its expansion.

As his name indicates he was an Ohio product, born and reared at East Akron where his father's match factory was situated. He lived there all his life from the year of his birth, 1841, to that of his death, 1920. It was there and in the town he built out of it, Barberton, that he carried on his business and saw develop before his eyes the amazing growth of the rubber industry in the district around him. He had foresight and shrewdness to take a hand in that and as early as 1893, when the bicycle tire was making its influence felt he induced some

other wealthy men to join with him in starting a company which was named the Diamond Rubber Company, after his Diamond Match Company.

Very soon some Harvard graduates and other Boston young men entered its service and mapped out its work, which became the manufacture of rubber goods of all descriptions. Mr. Barber gave them a free hand, but remained a director of the company to the end, was president for many of the early years and always made his influence felt. That he retained his interest in rubber is shown by his becoming a director of the Alkali Rubber Co., the subsidiary formed in 1904 to reclaim rubber. The Diamond Rubber Co. was amalgamated with The B. F. Goodrich Co. in 1912 and Mr. Barber became a director of the latter company also.

After his ostensible retirement from business about ten years ago, he turned to the development of a 2,500 acre farm in his home town, a model experimental farm for all kinds of crops and plants and for the rearing of high bred stock. This farm which is believed to be worth \$4,000,000, will go to the Western Reserve University, Cleveland, Ohio. His fortune is estimated at \$10,000,000.

The wife to whom Mr. Barber was married in 1866, Laura L. Brown, died many years ago; three years before his death he married Miss Mary Orr, his private secretary. Mr. Barber was a giant in size, over six feet tall, and a picture of health till he fell a victim to influenza.

ASSISTANT SALES MANAGER MILLER RUBBER CO.

William Quigley Cramp, assistant sales manager of The Miller Rubber Co., Akron, Ohio, died suddenly of neuritis January 23, 1920, at the Akron City Hospital, aged 41 years.

WILLIAM Q. CRAMP.

Mr. Cramp was born in Philadelphia, Pennsylvania, October 9, 1878, and on December 30, 1915, married Frances M. Smith, of Buffalo, New York. He had been with the Miller company for over five years, first as a tire salesman in southern territory. His record in this field was so enviable that he was made branch manager at Atlanta, Georgia, and two years ago went to the Akron factory as assistant sales manager, in which position he became one of the most efficient and popular executives of the company. Held in high regard by his associates, his loss is keenly felt. Funeral services were held at the family residence, 491 North Howard street, January 26, and interment was in a vault at Glendale Cemetery.

Mr. Cramp is survived by his wife, Frances M. Cramp; his parents, Mr. and Mrs. Harry A. Cramp, Philadelphia, Pennsylvania; two sisters, Mrs. Thomas Patten and Miss Elsa Cramp, of Philadelphia, and a brother, Howard S. Cramp, Richmond, Virginia. He was a member of the Buffalo, New York, Commandery, Knights Templars.

SOUTH AFRICA IN 1918 IMPORTED \$2,112,718 WORTH OF RUBBER goods, including tires, of which the United Kingdom's share was \$1,283,476 and that of the United States was \$589,090.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(776.) A manufacturing concern requests information as to where it can purchase lead oleate.

(777.) An inquiry has been received for the addresses of manufacturers of machinery for making dress shields of rubber without the use of cloth.

(778.) A request has been received for the addresses of dealers in benzo-hydro.

(779.) A European manufacturer asks for the address of the manufacturer of the Sarco thermostatic regulator.

(780.) A Canadian concern requests the addresses of manufacturers of or jobbers in ear drums for use in swimming.

(781.) Inquiry is made for the address of the manufacturer of the "E. Z. Walk" and "Slipknor" insoles.

(782.) A subscriber requests the addresses of manufacturers of spreaders for valves for inner tubes.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Requests for each address should be on a separate sheet, and state number.

DISTRICT OFFICES.

New York: 734 Customhouse.
Boston: 1801 Customhouse.
Chicago: 504 Federal Building.
St. Louis: 402 Third National Bank Building.
New Orleans: 1020 Hibernia Bank Building.
San Francisco: 307 Customhouse.
Seattle: 848 Henry Building.

COOPERATIVE OFFICES.

Cleveland: Chamber of Commerce.
Cincinnati: Chamber of Commerce;
General Freight Agent, Southern
Railway, 96 Ingalls Building.
Los Angeles: Chamber of Commerce.
Philadelphia: Chamber of Commerce.
Portland, Oregon: Chamber of Commerce.
Dayton, Ohio: Dayton Chamber of Commerce.

(31,841.) Importer in Brazil desires to secure agencies for and to purchase caoutchouc direct. Correspondence in French or Portuguese.

(31,843.) A firm in Sweden wishes an agency for the sale of inner tubes for bicycles.

(31,849.) A firm in England desires to purchase dressing combs of vulcanite, chiefly 7, 7½ and 8 inches long. Quote f.o.b. English port or f.o.b. New York.

(31,896.) A firm in Mexico wishes to purchase white canvas rubber-soled tennis shoes. Quotations c. i. f. city of Mexico or f.o.b. shipping point. Cash against documents.

(31,916.) A firm in Mexico desires to purchase tires. Quote f.o.b. shipping point.

(31,928.) A firm in Spain wishes an agency on commission for the sale of rubber overshoes and rubber goods. Quote c. i. f. Spanish port. Correspondence in Spanish.

(31,939.) A merchant in Spain wishes to secure an agency to sell rubber raincoats on commission. Quote c. i. f. Spanish port. Correspondence in Spanish.

(31,943.) A firm in Norway wishes to purchase automobile accessories, rubber, and rubber goods. Quote c. i. f. Norwegian port. Payment through banks in Norway and New York.

(31,954.) Agency desired by a firm in Holland for the sale of motorcycle and bicycle tires and tubes. Quote f.o.b. New York. Cash against documents.

(31,965.) A firm in Norway desires agency for sale of rubber, rubber goods, and kindred lines. Quote c. i. f. Norwegian port. Payment through banks in Norway or New York.

(31,995.) A firm in Brazil wishes to represent manufacturers of rubber tubes and tires.

(32,016.) Importer in Belgium wishes an agency for bicycles and tires. Payment two-thirds cash with order, balance upon receipt of goods. Correspondence and catalogs in French.

(32,042.) Commercial agent from Bulgaria wishes to secure an agency for belting and rubber shoes.

(32,044.) A merchant in India desires to secure an agency for motor accessories, tubes and tires. Quote f. o. b. Bombay. Payment through bank in Bombay.

(32,050.) A man in France wishes an agency for the sale of motor tires and tubes and all articles for automobile and pneumatic trade. Quotations c. i. f. Bordeaux. Correspondence may be in English.

(32,059.) Agent in South Africa wishes to secure agency for rubber soles and heels; either one or two-piece.

NEW TRADE PUBLICATIONS.

THE HOOVEN, OWENS, RENTSCHLER CO. OF HAMILTON, OHIO, which for nearly forty years has been installing its Hamilton Corliss engines in power plants throughout the country, has issued a striking folder describing its sugar mill machinery.

THE APSLEY RUBBER CO., HUDSON, MASSACHUSETTS, is mailing to the trade a handsome 80-page catalog of its extensive lines of rubber footwear for the year 1920. Rubbers, arctics, and rubber boots and shoes of many styles are shown, including first- and second-grade brands, an extra quality brand, and the special wear-resisting "Rock-Hill" line.

T. W. MORRIS, 3304 WARREN AVENUE, CHICAGO, ILLINOIS, has published a well illustrated 26-page brochure describing and containing operating instructions for his automatic trimming machines for heels, soles, mechanical goods, plumbers' supplies, etc., also his water bottle and fountain syringe machine and patent cutters. These trimmers have already been described in **THE INDIA RUBBER WORLD**.

"FACTS ABOUT PNEUMATIC TRUCK TIRES" IS A LARGE AND interestingly illustrated brochure of 48 pages, issued by the United States Tire Co., New York City, to tell by word and picture about the use of nobby cord tires throughout the country for a great variety of purposes and under the most trying conditions. Much useful information is presented and the practicability of pneumatic tires for heavy commercial vehicles is amply shown.

"THINGS THAT INTEREST FIRESTONE SHAREHOLDERS" IS THE title of a handsome 16-page brochure, bound in boards, which outlines the rubber situation and the tire demand in America and presents the outstanding features of the accomplishments, future plans, plant enlargements, and organization of the Firestone Tire & Rubber Co.

THE EAGLE RUBBER CO., ASHLAND, OHIO, MANUFACTURERS OF toy balloons and novelties, has issued a new catalog, illustrating and describing its complete line of toy balloons. This is an especially attractive catalog with an appropriate cover design.

THE GOODYEAR TIRE & RUBBER CO., AKRON, OHIO, HAS PUBLISHED an attractive 84-page booklet telling the history of the industrial representation plan which was inaugurated in its factory in April, 1919, and is said to be functioning successfully. The plan or constitution of the Council of Industrial Relations, as it is called, is given in full, indicating that the assembly is based on the plan of the United States Government, with a Senate and House of Representatives as legislative bodies, the factory manager holding the executive position corresponding to the President.

Following an account of the election of factory representatives with specimen posters, ballots and the actual result of the polling, there is a section devoted to the assembly as now constituted

with portraits and biographical sketches of all men holding office. It is a booklet that will be read with interest by all students of industrial relations.

"AUTOMOBILE RACING SEASON, 1919," IS THE TITLE OF A HANDSOME 48-page, profusely illustrated booklet dedicated to the drivers of racing cars, who have contributed the valuable lessons of the speedways to the advancement of automobile and tire development. Published by The Goodyear Tire & Rubber Co., Akron, Ohio, and intended primarily to show the popularity of Goodyear cord tires among the racing fraternity, it also contains much general information of interest regarding the development of automobile racing, its place in automobile development, racing tires, how races are timed, the pit and tire service rendered to each car, and the principal racing records of the season.

THE EDITOR'S BOOK TABLE.

"CEYLON RUBBER PLANTER'S MANUAL." By R. Garnier. The Times of Ceylon Co., Limited, Colombo, Ceylon. (Small quarto, 7 1/4 by 6 1/4 inches, 206 + 15.8 pages, illustrated.)

A THOROUGHLY TECHNICAL AND PRACTICAL HAND-BOOK designed for planters in Ceylon, but, with certain modifications, useful to planters in Southern India and Malaya, wherever the conditions of climate and soil are similar. The author begins by clearing the ground for rubber cultivation; he then examines the soil, fertilizes it, plants the trees, and nurses them to tapping age. He describes the methods of tapping and the diseases to which plants are subject, then turns to "manufacturing" and the factory. These are the local terms for preparing the rubber for market, and for the buildings where the smoking and packing of the crude rubber are done.

The latter half of the book is taken up with provisions for the coolie labor employed, the housing, sanitation, medical care of the laborers, and with architectural plans for the many buildings required. At the end are interesting and instructive statistical tables of the yearly cost of running a large plantation, with detailed lists of expenditures. It teaches the Ceylon planter all that a book can tell him, and will be helpful to planters in neighboring lands.

"THE FINANCIER RUBBER SHARE HAND BOOK," SIXTEENTH edition, December, 1919. The Financier and Ballionist, Limited, London. (Cloth, octavo, 954 pages.)

This useful and convenient annual contains detailed information regarding the British stock companies that own rubber plantations in any part of the world and whose shares are dealt with in the London rubber market. Compact data will be found regarding capital, officers, business addresses, financial status, dividends, the acreage of the plantations, the crops, yield prices and so forth. In the introduction E. L. Killick, the rubber expert of the Financier, gives his views about the immediate future of rubber production.

"HENDRICKS' COMMERCIAL REGISTER OF THE UNITED STATES for Buyers and Sellers." S. E. Hendricks & Co., New York City. 1,270 pages.

The 28th annual edition of this work deals as usual with both raw materials and finished products of all industries, electrical, engineering, chemical, steel and so forth, including rubber. A new method of exterior indexing by coloring has been added. A "trades index" of 162 pages, with cross references, is followed by a classified trades list of 1813 pages, containing over 18,000 different products. After this come the names and addresses of manufacturers, 216 pages, an alphabetical index of 487 pages and an index of advertisers. It has been brought up to date in every respect and is an invaluable work for sales and purchasing departments in all business houses.

Index to "Rubber Machinery" will be sent free upon request.

CONDAMINE, THE POPULARIST OF INDIA RUBBER.

HOW INDIA RUBBER was made known to Europe by Charles Marie de La Condamine, of the Academy of Sciences, and later of the French Academy is told very entertainingly by André Dubosc in his "*Histoire du Caoutchouc*." La Condamine was a typical product of the eighteenth century; a thorough Parisian, born of a commercial family that had been ennobled because it was in the Government employ. He left school at seventeen to enlist in the army, where he distinguished himself by foolhardy valor, but when peace came he threw up his commission and became a literary man about town. He showed the hereditary business sense and ability to push his way socially; he frequented the salons of literary ladies, could work off clever verse, and was interested in all scientific novelties. He dabbled in chemistry, in mathematics and in astronomy; he was a friend of Voltaire, and of most of the prominent literary Frenchmen of his time. He lived this life of fashion until he was thirty-four, and indulged in an adventurous journey to the Orient, spending a year in Constantinople.

A scientific quarrel as to whether the earth was flat or projected at the poles, resulted in two French expeditions setting out to measure the degrees of longitude, one to Lapland, the other to some place near the equator. La Condamine joined the latter expedition, which picked out Ecuador, then a portion of Peru, as the scene of its activity. The men in charge kept quarrelling, and La Condamine left the others at Playa del Oro to make his way to Quito alone. He had a hard time on his journey along the Andes and reached his destination a month after the rest of the expedition; but he was a good botanist and he kept his eyes open, and on reaching Quito the first thing he did was to send to the Academy of Sciences "some rolls of a blackish, resinous material" which he had gathered in the forests; namely, caoutchouc. This was in 1736. The expedition stayed on for several years measuring the meridian, constantly quarrelling among themselves and being interfered with by the Spanish Viceroy.

La Condamine in writing home explained that this liquid flowed out of a tree, *Hevé*, after a single incision, milk-white and gradually hardening and blackening in the air. The natives made torches of it; they spread the liquid on cloth and used it as we use waxed cloth. Along the Amazon the Indians made boots of it which kept out the water; they put it around molds shaped like bottles, and when the gum had hardened they broke the mold, producing a light, unbreakable bottle that would hold any liquid. He set to work himself and made waterproof cloths, and also a splendid rubber case for his quadrant. He noted too, that the natives made small bottles of the rubber which they filled with hot water and used as syringes; they in consequence, called the tree, *seringueira*.

By September, 1742, after he had made important discoveries in physics and mathematics, he decided that his work was done and that he would make his way down the Amazon to the

French settlement at Cayenne, a journey of 2,000 miles in nearly unexplored regions. He made the journey alone, with only native attendants and reached Guiana in May, 1743. On his trip he had plenty of opportunities of examining the manner in which the rubber grew and the natives utilized the rubber. As France was at war with England he was obliged to wait two years at Cayenne before returning home, but he reached La Rochelle at last on March 7, 1745. He returned to his literary pursuits and told in the salons the story of his adventures and the wonderful qualities of the rubber which he had found, specimens of which he exhibited. Paris of the eighteenth century, however, did not take the discovery any more seriously than it did the beginnings of modern science, and it was reserved to Hancock and Good-year in the following century to break the way for the modern uses of rubber.

In the five years following his return La Condamine wrote six big volumes, and, despite his social activities and his literary quarrels, kept up his interest in rubber. His friend Fresneau found the rubber tree in Guiana and wrote to him the description of the native method of gathering it, smoking it and using it. He and the French chemists who examined the new substance reached conclusions that are startlingly similar in many points to those reached by modern rubber chemists. Fresneau, for instance, thought it was a kind of condensed resinous oil; the name now used is polyterpene. To prevent it from sticking he used Spanish white, ashes or dust.

La Condamine induced other explorers to search for rubber and learned before he died in 1775 that it had been found in the Isle de France and in Madagascar. Nevertheless, the only practical commercial use found for the caoutchouc in that century was as an eraser of pencil marks, which led to Priestley's christening it by the name it has retained in English, "India rubber."

NEW INCORPORATIONS.

Accurate Cover Co., Inc., February 5, 1920 (New York), \$50,000. R. M. and D. Coen, G. A. Woolf—all of 373 Canal street, New York City. To deal in rubberized fabrics, etc.

Associated Tire Corp., The, December 15, 1919 (Massachusetts), \$60,000. H. L. Michaels, H. C. Cashman, W. Hartstone—all of 40 Court street, Boston, Massachusetts. Principal office, Boston, Massachusetts. To buy, sell, exchange, repair and dispose of rubber, fabric, cord tires and inner tubes.

Bell Tire & Rubber Co., Inc., January 28, 1920 (Virginia), \$50,000. R. J. Bell, president; A. R. Hall, vice-president; H. W. Powers, secretary; T. Bell, treasurer. Principal office, Richmond, Virginia. To deal in automobile accessories.

Bliss Rubber Co., The, November 21, 1919 (Massachusetts), \$5,000. J. E. Crowley, 80 Dean road, Brookline; P. C. Adams, 514 Liberty street, South Braintree—both in Massachusetts; A. Bliss, 130 Empire street, Providence, Rhode Island. Principal office, Boston, Massachusetts. To manufacture and deal in tires, tire rims, woven hose and rubber hose.

Boston Sanitary Belt Co., December 10, 1919 (Massachusetts), \$50,000. J. W. Barlow, 80 Tyler street, Wollaston; E. M. Sanger, 120 Glenville avenue, Boston; A. C. Gould, 1704 Beacon street, Waban—all in Massachusetts. To manufacture elastic and non-elastic sanitary belts and other sanitary articles.

Central Tire Co., December 2, 1919 (Massachusetts), \$25,000. N. T. Balch, 35 Lincoln street, Gardner; R. L. Chandler, 219 Washington street; B. W. Jenkins, 35 Lancaster street—both of Leominster—all in Massachusetts. Principal office, Leominster, Massachusetts. To sell automobile tires, accessories and supplies.

Century Rubber Stamp Works, Inc., January 29, 1920 (New York), \$24,000. W. C. Campbell, 410 Fifth avenue; C. Trebing, 900 Hart street, both of Brooklyn; H. Heine, 286 St. Ann's avenue, Bronx—all in New

"*Histoire du Caoutchouc*."

CHARLES DE LA CONDAMINE.
(1701-1775.)

York. Principal office, 551 Pearl street, New York City. To manufacture rubber stamps, etc.

Cleveland Amalgamated Tire Stores Corp., February 9, 1920 (New York), \$20,000. S. and A. Newman, G. J. Bates—all of 1974 Broadway, New York City. To deal in tires, etc.

Crude Rubber Brokerage Co., Inc., January 31, 1920 (New York), \$10,000. M. Frankfurter, president; N. Diamond, secretary and treasurer. Principal office, 198 Broadway, New York City. To buy and sell rubber on commission.

Dalf Tire Co., Inc., February 16, 1920 (New York), \$50,000. G. Gaschoff, 135 Junction avenue, Corona; J. H. Jackson, Secaucus; M. M. Coughlin, 233 West 121st street, New York City—all in New York. To manufacture tires.

Dawson Tire & Supply Co., January 14, 1920 (New Jersey), \$75,000. Albert J. and James J. McGraw, both of 215 Parker street, S. Goldson, 24 Farley avenue—all in Newark, New Jersey. Agent in charge, A. J. McGraw. To manufacture buy, sell and deal in tires and automobile accessories.

East Manufacturing Corp., December 10, 1919 (New York), \$250,000. H. S. Esch, T. F. Fay, W. G. Wahaley, all of 27 William street, New York City. To make treads for automobiles.

Fond du Lac Oil & Rubber Corp., January 2, 1920 (Wisconsin), \$25,000. D. E. Russell, J. R. Matthews, R. W. Slater. Principal office, Fond du Lac, Wisconsin. To manufacture, buy, sell and deal in rubber tires, tubes, rubber specialties, etc.

Gammeter Co., W. F. The, December 26, 1919 (Ohio), \$100,000. W. F. Gammeter, president; L. B. Gammeter, vice-president; F. O. Gammeter, secretary and treasurer; J. M. Gammeter, assistant secretary and production manager; B. I. Gammeter, director. Principal office, Cadiz, Ohio. To manufacture Universal steel and fender stock shells, belting shells, tire machine drums, and steel specialties.

Globe Shoe Heel Corp., February 13, 1920 (New York), \$6,000. E. Roth, 230 New Main street; S. Roth, 55 Hawthorne avenue; M. Roth, 36 Madison avenue—all of Yonkers, New York. Principal office, Yonkers, New York. To deal in rubber and leather goods.

Hanes Rubber Co. of New York, January 15, 1920 (New York), \$10,000. E. O. Machin, W. T. H. Reilly, R. L. Deisser—all of 135 West 79th street, New York City. To deal in pneumatic tires.

Highland Tire & Rubber Co., November 24, 1919 (Delaware), \$200,000. P. P. Reilly, H. D. McCutcheon, T. A. McCullough—all of Pittsburgh, Pennsylvania. To manufacture, buy, sell and deal in tires, etc.

Hood Rubber Products Co., Inc., December 29, 1919 (Massachusetts), \$1,500,000. F. C. Hood, E. I. Aldrich, both of Brookline; J. D. Colt, C. H. Dwinnell, both of Newton; A. D. Bosson, Boston; H. Gage, Worcester; H. E. Warner, Lincoln—all in Massachusetts. Principal office, Watertown, Massachusetts. To buy, sell and deal in footwear, clothing, tires, tubes and rims.

International I. T. S. December 9, 1919 (Delaware), \$1,200,000. T. L. Croteau, P. B. Drew, H. E. Knox—all of Wilmington, Delaware. To manufacture rubber products, including leeches.

J. W. P. Tire Co., The, July 19, 1919 (Ohio), \$5,000. G. L. Webber, president; F. E. Simon, vice-president; W. E. Bennett, secretary and treasurer; F. M. Jessup, general superintendent; R. Sigler, works manager. Principal office, 952 Valley street, Dayton, Ohio. To manufacture tires. McClaren Rubber Tire Co. of New York, Inc., February 17, 1920 (New York), \$25,000. W. F. Smith, 644 Riverside Drive; C. E. Lynch, 720 Lexington avenue; A. F. Lynch, 56 East 59th street—all of New York City. To deal in tires.

Manhattan Insulated Wire & Cable Corp., February 20, 1920 (New York), \$50,000. S. A. Morrissey, 30 Church street; C. Karzon, 135 East Houston street, both of New York City; R. H. Cherry, Westfield, New Jersey. To manufacture insulated wire, cable, hose, etc.

Mustor Manufacturing Co., Inc., February 13, 1920 (New York), \$50,000. G. F. Mustor, 25 Hubbard place, Brooklyn; A. E. Barnes, 2120 Jerome avenue, Bronx; J. W. Mitchell, 1231 Grand Central Terminal, New York City—all in New York. To manufacture rubber and asbestos goods.

Ohio Valley Tire & Rubber Co., The, January 2, 1920 (Ohio), \$50,000. A. Stollmaier, president; R. C. Smith, vice-president; J. M. Ferguson, secretary and treasurer; A. Bernstein, general manager; J. Sagneimer, director. Principal office, southeast corner Eighth and Race streets, Cincinnati, Ohio. To distribute various makes of tires and deal in all standard makes.

Otto Tire & Rubber Co., December 13, 1919 (Indiana), \$100,000. H. J. Otto, president; G. F. Ahlenger, vice-president; A. J. Hoffman, secretary; H. E. Boppus, treasurer. Principal office, Princeton, Indiana, 208 W. Upper Fifth street, Evansville, Indiana. To distribute Perfection tires, repair and rebuild tires and tubes.

Prudential Rubber & Asbestos Tire Corp., February 16, 1920 (New York), \$25,000. H. Hennig, J. Parrino, J. Di Girolamo—all of Buffalo, New York. Principal office, Buffalo, New York. To manufacture rubber goods, tubes, etc.

Rambler Rubber Corp., December 28, 1919 (Delaware), \$50,000. N. N. Kenney, M. Butler, M. M. Lucey—all of Wilmington, Delaware. To deal in automobile tires.

Road Gripper Tire & Rubber Co., November 26, 1919 (Minnesota), \$150,000. F. M. and C. Trahm, T. W. and I. M. Bolzendahl—all of Minneapolis, Minnesota. Principal office, St. Paul, Minnesota. To manufacture leather and rubber goods.

Simplicity Valve Co., December 18, 1919 (Massachusetts), \$200,000. C. J. Reynolds, 30 Summer street, Melrose; S. L. Reide, 44 street, Cambridge; E. C. Conant, 140 Mt. Vernon street, Newtonville—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in automobile and pneumatic tires. Universal Rubber Products Co., Inc., May 29, 1919 (Delaware), \$2,000,000. T. L. Croteau, P. B. Drew, C. L. Rumliger—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture hose, belting, straps, tubes, tires and rubber goods.

Stockwell Rubber Co., Inc., August 20, 1919 (Pennsylvania), \$25,000. F. E. Stockwell, president; A. J. Vollrath, vice-president; W. P. Sibley, secretary and treasurer. Principal office, 229 North 12th street, Philadelphia, Pennsylvania. Wholesale distributor.

Traveler Tire Co. of Pittsburgh, January 14, 1920 (Delaware), \$100,000. S. D. Townsend, Jr., V. Barsky, G. J. Reed—all of Wilmington, Delaware. Universal Rubber Products Co., Inc., May 29, 1919 (Delaware), \$2,000,000. T. L. Croteau, P. B. Drew, C. L. Rumliger—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture hose, belting, straps, tubes, tires and rubber goods.

Vulcan Rubber Co. of New Jersey, December 11, 1919 (New Jersey), \$100,000. E. R. Crow, W. S. Goodrich, both of East Orange; W. E. Dunkinson, Newark—both in New Jersey. Principal office, 232 Halsey

street, Newark, New Jersey. Agent in charge, W. E. Dunkinson. To make, purchase, sell and deal in tires and tubes. Young Rubber Products Co., January 12, 1920 (Delaware), \$600,000. To manufacture "Ev-R-Wear" electric rubber patch, etc.

INTERESTING LETTERS FROM OUR READERS.

QUESTIONS OF INTEREST.

TO THE EDITOR:

DEAR SIR:—As a big holder of rubber growing companies' shares, I follow with interest the rubber trade and have posted to me each month your paper (THE INDIA RUBBER WORLD) by the International News Agency.

I should esteem it a great favor if you would kindly give me a reply to this letter, and at the same time tell me how I can repay you.

It has recently been stated in the press that the stocks of rubber in America exceed 50,000 tons. Is this correct, do you think?

Further, the English papers estimate that America will take (U. S. A. alone) 360,000 tons of rubber this year, roughly, 50 per cent more than last year. Do you consider this probable?

As a close follower of the market I am convinced that if your demands exceed 240,000 tons the stocks will be reduced so low that by December, 1920, rubber will reach at least 3s. 6d. to 4s. a pound.

Could you state also the number of motor cars registered in the U. S. A. December 31, 1919, including, of course, motor trucks and wagons? Also the number of cars and wagons made during 1919 and the number estimated to be built during 1920.

It would be interesting to know whether you consider that a shortage of rubber is likely in the autumn of this year or early next year.

ENGLISHMAN.

FINANCES REQUIRED FOR BALATA EXPLOITATIONS.

TO THE EDITOR:

DEAR SIR:—On my arrival here last month, I saw your balata article in your June issue, having just returned from the Rio Branco district via Manaus, Brazil, after exploring and starting a balata industry. This industry is now well started under the name of Norzagaray & Boyd.

I was the pioneer official (local secretary) of the directorate formed in Georgetown, British Guiana) from London sent out by the Consolidated Rubber & Balata Estates, Limited, and left after two years. The C. R. B. E., Limited, took over the grants and balata businesses of Garnetts, Davsons, Downer, McKinnon, Dr. Bovallius and north territories from a "Colonel" Link.

I intend returning to Manaus to do explorations for fibers chiefly, and incidentally balata, if I have capital at my disposal. If there are any live manufacturers in your country who want to carry out explorations and secure balata areas, please let them communicate with me. Agreements must be made and treated according to English laws. The areas just explored are now being transferred to an English combine. I know where there are other reefs, etc. No use opening bank credits in Manaus for the produce. If a large prospecting company is formed, I will take charge of the expedition and the financiers can send their own representative to manage the cash, accounts and correspondence.

In 1918 for end of season, and owing to shortage of bleeders, Norzagaray & Boyd shipped about 16 tons, and during 1919 season it will be between 35 and 40 tons. Bleeders had to be imported and trained. The Peruvians turn out very capable and reliable.

WILLIAM A. BOYD.

15 Seething Lane, London, E. C. 3.

News of the American Rubber Trade.

DIVIDENDS.

THE AMAZON RUBBER CO., Akron, Ohio, has declared its semi-annual dividend of three and one-half per cent on preferred stock.

The American Chicle Co., New York City, has declared its quarterly dividend of one and one-half per cent, payable April 1 on stock of record March 20, 1920.

The International India Rubber Corp., South Bend, Indiana, has declared the regular annual dividend of seven per cent in cash on the preferred stock for the year 1919 and has also directed a cash distribution out of earnings equal to six per cent on common stock. In addition, the directors have authorized the payment in cash of the entire accumulated dividends on outstanding preferred stocks for the years 1917 and 1918.

The Plymouth Rubber Co., Canton, Massachusetts, has declared its quarterly dividend of one and three quarters per cent, payable March 1 on preferred stock of record February 24, 1920.

The van der Linde Rubber Co., Limited, Toronto, Ontario, has declared its regular semi-annual dividend at seven per cent, payable to shareholders of record January 1, 1920.

The Tyer Rubber Co., Andover, Massachusetts, declared and paid on February 14, 1920, its quarterly dividend of \$1.50 per share on preferred stock.

FINANCIAL NOTES.

While the detailed statement of the operations of the United States Rubber Co. for the year 1919 is not yet completed, it is announced that the volume of sales and the net earnings for the past year are the largest in the history of the company. The surplus earnings for the year 1919 will doubtless be ample to cover all dividends paid during the year, including the cash dividends and the common stock dividend of \$9,000,000 declared January 8.

At the close of the year the company had no outstanding notes or obligations other than current accounts and acceptances necessary in the conduct of its business. The cash in bank was over \$15,000,000 and \$2,800,000 of Liberty Bonds were in its treasury.

It is estimated that the very substantial enlargement of the company's tire plants at Detroit, Michigan; Indianapolis, Indiana; Hartford, Connecticut; Providence, Rhode Island, and Kitchener, Ontario, Canada, now in progress will, when completed, more than double the present tire production.

The Portage Rubber Co., Akron and Barberton, Ohio, has offered 5000 shares each of its preferred and ordinary stock to its stockholders at par. Each stockholder could subscribe up to 20 per cent of his holdings, but was obliged to take equal amounts of common and preferred. The option terminated on January 10, 1920.

Sales of The Mason Tire & Rubber Co., Kent, Ohio, for the quarter ended January 31, 1920, amounted to \$1,313,927.35, an increase of over 100 per cent over the figures for the same quarter of last year, which were \$630,930.16. The Mason factory expects to show more than 100 per cent gain in business for the year. The net profits for the quarter show a handsome increase over those for the same period last year.

The Gillette Rubber Co., Eau Claire, Wisconsin, has issued \$750,000, 7 per cent cumulative preferred stock, par value \$100. The new capital will provide for expanding both the tire and the raincoat and waterproofing departments. The company began operations in March, 1917, turning out 100 tires a day; its present production is 1000 tires and, when the additions to the plant are completed, will be over 1500 tires a day.

The sales of the B. F. Goodrich Company in 1919 amounted to \$142,000,000 and at the present rate will be \$300,000,000 for 1920. The common stock paid 6 per cent and the year's earnings show that 24 per cent was earned on it.

A special meeting of the stockholders will be called for March 10, 1920, to consider a plan for financing which will be presented in detail. As part of the plan the directors propose to change the common stock to non-par value shares, in harmony with the action of many of the largest industrial institutions at this time. The stockholders will be asked to increase the number of shares of authorized common stock so as to provide, among other things, for the conversion of the proposed notes. In addition, the directors deemed it advisable to have shares of the new common stock available for purchase by the employees of the company, so that they may participate in the company's prosperity. If the stockholders take the necessary action to authorize the proposed convertible notes, opportunity will be given them, in due course, to subscribe thereto upon favorable terms. The issue has been underwritten by a group of New York bankers.

E. F. Jones, of Elyria, Ohio, formerly identified with the steel industry, has been elected president of The Republic Rubber Corp. to succeed Guy E. Norwood, who has resigned.

At a meeting held February 20, the stockholders voted favorably on the resolution of the directors advising amending the articles of incorporation so as to increase the number of shares of common stock without normal or par value from 650,000 to 1,500,000 shares, and also so as to increase the amount of working capital from \$15,750,000 to \$20,000,000.

The recommendation of the directors was adopted by the following vote, the respective vote of each class of stock exceeding 60 per cent of such stock; first preferred stock, 42,376 shares, second preferred stock, 15,819 shares and common stock, 269,787 shares. Total 327,982 shares affirmative, none in the negative.

FINANCIAL STATEMENT OF THE CONVERSE RUBBER SHOE CO.

The Converse Rubber Shoe Co., Malden, Massachusetts, has recently issued its annual balance sheet for the year ended December 31, 1919, which shows the following figures adjusted to the sale of a \$500,000 preferred stock issue now in the market:

CURRENT ASSETS.		
Cash	\$208,102.16	
Acc'ts receivable	1,261,754.38	
Notes receivable	1,361,811.31	
Liberty bonds	349,958.06	
Raw material	672,003.51	
Finished goods	1,634,891.00	\$4,253,327.56
Investments	\$ 37,436.21	
Other accounts receivable	12,995.01	
Plant and equipment	917,929.66	
Auto trucks	15,773.52	
Leases, trademarks, copyrights	255,000.00	
C.R.S. Co. general capital stock	38,300.00	
C.R.S. Co. preferred capital	4,100.00	
Prepaid expense	146,915.89	\$1,423,450.29
		\$5,676,777.85
CURRENT LIABILITIES.

General capital stock	375,000.00	
Three year gold coupon notes	283,000.00	
New York reserve	3,819.53	
Tire adjustment reserve	264.27	
Reserve	148,130.49	
Surplus	601,383.51	\$3,538,587.82
		\$5,676,777.85

The Converse Rubber Shoe Co., Malden, is offering to the

public a \$500,000 issue of seven per cent cumulative preferred stock, the par value of the shares being \$100. The proceeds of this issue will be used to reduce floating debt and to finance the greatly increased volume, the company's sales having jumped from \$977,180 in 1913 to \$4,923,206 in 1918, and an estimated total of \$5,500,000 for the fiscal year ending April 1, 1920. For the past four years the demand for the company's products has greatly exceeded the supply, and during the past two years alone orders aggregating \$2,000,000 were refused.

THE GOODYEAR TIRE & RUBBER CO. STATEMENT.

According to the annual report of The Goodyear Tire & Rubber Co. for the fiscal year ended October 31, 1919, the last year's business has been the largest and most profitable in the history of the organization. Sales were \$108,914,982, against \$131,247,382 for the preceding year; net profits (subject to Federal tax) were \$23,277,245, against \$15,388,150 for the preceding year. During the year dividends were paid on the capital stock as follows: first preferred, 7 per cent, \$1,064,806; second preferred, 8 per cent, \$1,149,074; common, 12 per cent, \$2,489,355. In accordance with the articles of incorporation, as amended, capital stock was redeemed during the year as follows: first preferred par value of \$609,900 and second preferred \$1,318,400. There remains an unappropriated surplus of \$33,332,666, subject to Federal taxes for the year.

During the year the authorized preferred and common stock of the company was increased to \$100,000,000 each. Of the new preferred stock offered to stockholders and employees, \$41,135,900 has been subscribed by 30,409 persons throughout the country, of which amount \$7,843,600 was subscribed by 17,407 employees of the company.

The balance sheet as of October 31, 1919, follows:

ASSETS.	
Plant, as per books:	
Real estate and buildings	\$17,752,094.19
Machinery and fixtures	17,507,512.49
	\$35,260,506.68
Patents, trade-marks, designs,	1.00
Securities owned—other than U. S. Liberty Bonds—book value	4,440,602.69
First preferred stock, purchased and held in treasury, 3,592 shares, par value \$359,200	326,993.19
Notes receivable of officers and employees on capital stock, secured by such stock to the par value of \$16,125.00	1,324,741.07
Employees' subscriptions for 2nd preferred stock (balance unpaid)	48,661.68
Inventory and current assets:	
Inventory	\$35,566,779.06
Accounts and notes receivable (provision in reserve for doubtful items \$23,445.30—see contra)	23,635,353.98
Advances to agents, salesmen and companies	3,648,895.19
United States Liberty Bonds, \$3,405,800.00—less notes payable, secured by same	1,120,000.00
	2,285,800.00
Cash on deposit and on hand	10,393,241.32
	75,532,069.53
Advances to the Goodyear Improvement Co. and to The Goodyear Heights Realty Co.	1,880,328.06
Suspended assets (provision in reserve for doubtful items, \$182,076.36—see contra)	182,076.36
Prepaid rentals, interest, insurance, etc.	1,280,851.42
	\$120,276,831.70

CAPITAL AND LIABILITIES

Capital stock (par value \$100 per share):	
First preferred (7 per cent cumulative)—Authorized and issued, \$35,000,000.00	
Less—redeemed	1,826,100.00
	\$33,173,900.00
Second preferred (8 per cent cumulative)—Authorized \$25,000,000.00, issued 14,468,700.00	
Reserved for issue to employees on partial payment subscriptions	347,100.00
	14,815,800.00
Less—redeemed	1,318,400.00
Common authorized, \$50,000,000.00 issued	20,737,600.00
	\$57,428,900.00
Current liabilities:	
Purchase accounts and acceptances payable	7,722,740.24
Sundry other accounts payable	2,766,021.69
Notes payable	9,560,000.00
Accrued first preferred dividends	138,738.84

Second preferred dividends payable November 1, 1919	289,200.66
Federal income and excess profits taxes to October 31, 1918, balance unpaid	1,368,782.17
	21,785,483.60
Reserves:	
For doubtful accounts (current)—see contra	231,445.30
For doubtful accounts (suspended assets)—see contra	182,076.36
For insurance on branch stocks	103,335.82
For industrial compensation	38,470.10
For pensions	100,000.00
For depreciation of plant	7,074,454.11
	7,729,781.59
Surplus, subject to federal taxes for the year	33,332,666.11
	\$120,276,831.70

Subject to contingent liability for notes receivable discounted, amounting to \$8,064,414.82.

STATEMENT OF THE WELLMAN-SEAVER-MORGAN CO.

The Wellman-Seaver-Morgan Co. has reduced borrowed capital from \$1,200,000 to \$425,000 and regularly paid quarterly dividends, besides the deferred dividends on the preferred stock for the years 1917 and 1918. The original issue of preferred stock has been redeemed and cancelled, and there is but one class of preferred stock outstanding. The working capital is ample for anticipated requirements. The condensed balance sheet as of December 31, 1919, follows:

ASSETS.	
Current:	
Cash	\$305,978.14
United States Liberty Bonds	188,541.70
Notes receivable	1,187,807.24
Accounts receivable	942,021.92
Inventories	379,953.40
Uncompleted contracts	1,529,837.24
Other assets	74,746.20
Permanent land, buildings and machinery	3,143,317.33
Patents	264,512.75
Deferred	31,708.85
	\$8,197,914.71

LIABILITIES	
Current:	
Notes payable	\$425,000.00
Accounts payable	72,929.29
Dividends payable January 2, 1920	81,850.00
Accrued	37,718.50
Advances on contracts	1,529,837.24
Reserves	274,722.29
Capital stock—preferred	2,500,000.00
Capital stock—common	2,540,000.00
Surplus	1,172,113.86
	\$8,197,914.71

HOOD RUBBER PRODUCTS CO., INC.

The Hood Rubber Co., Watertown, Massachusetts, which has formerly sold its products, both footwear and tires, direct to manufacturers, dealers and jobbers and through subsidiary selling companies, has organized a new corporation, the Hood Rubber Products Co., Inc., under the laws of Massachusetts, with a capital of \$1,000,000 preferred and \$500,000 common stock, to take over the sale and distribution of its products. To the new company will be transferred all the business and assets of the former subsidiaries, namely: Hood Tire Co., Inc., Watertown, Massachusetts; Pilgrim Rubber Footwear Co., Boston, Massachusetts; Pioneer Rubber Shoe Co., Minneapolis, Minnesota; Dearborn Rubber Co., Chicago, Illinois; Iowa Rubber Shoe Co., Davenport, Iowa; Southwest Rubber Footwear Co., Kansas City, Missouri; Capital City Rubber Co., Columbus, Ohio; Grand Rapids Shoe & Rubber Co., Grand Rapids, Michigan.

The Hood Rubber Co. retains all the common stock of the new company, and until February 3, 1920, offered the preferred stock first to its own stockholders. The directors of the Hood Rubber Products Co. Inc., include the directors of the Hood Rubber Co. and the officers are: president, Frederic C. Hood; vice-president, Francis S. Dane and Edward I. Aldrich; treasurer, Erle A. Bishop; assistant treasurers, Francis S. Dane and Thomas H. Burton; general manager, William W. Duncan. The sales for 1918 and 1919 amounted to \$25,000,000 each year and a substantial increase on this sum is expected in 1920.

PERSONAL MENTION.

W. H. Hurley has been promoted from the position of western district manager to that of eastern district manager of The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, with headquarters in New York City.

John D. Olwell has been elected president of the Akron Overland Tire Co., Inc., formerly the Akron Tire Co., Inc., Long Island City, New York.

H. W. Harwell has been placed in charge of the New York general sales office of the Henderson Tire & Rubber Co., Inc., Columbus, Ohio, with headquarters at 40 Exchange Place, New York City.

William B. Clowar, for several years superintendent of the hose department of the New York Rubber Co. at Beacon, New York, recently resigned that position to become superintendent of the Auto Topping Department of the Vulcan Proofing Co., Dean street plant, Brooklyn, New York.

Casper Smith, president of the Smith Chemical & Color Co., Inc., 116 Nassau street, New York City, has just returned from a two months' business trip throughout the United States. He reports business brisk, particularly in the West and Middle West.

Clarence F. Brown has been appointed director of advertising of E. I. du Pont de Nemours & Co., Inc., Wilmington, Delaware, succeeding George Frank Lord, resigned.

The following promotions are announced by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania: Alexander Taylor from manager of works to assistant to vice-president, in charge of production, stocks, and stores in all plants; R. L. Wilson from general superintendent to works manager, East Pittsburgh; E. R. Norris, director of works equipment, in charge of machinery, tools, and methods in the various plants; C. B. Auel, manager of employees' service department; G. M. Eaton, chief mechanical engineer; C. W. Johnson and H. W. Cope, assistant directors of engineering; C. H. Champlain and E. S. McClelland, assistant works managers; John E. Bonham, assistant to works manager; E. S. Brandt, supervisor of equipment and methods; managers of engineering departments—A. M. Dudley, automobile department; R. P. Jackson, material and process; F. E. Wynne, railway equipment department; and G. H. Garcelon, small motor.

Arthur E. Allen has been appointed district manager, at New York City, for the Westinghouse Electric & Manufacturing Co. He succeeds Edward D. Kilburn, who has been made vice-president and general manager of the Westinghouse Electric International Co.

Mr. Allen entered the service of the Westinghouse company in 1902. He is a native of Toronto, Canada, and served with the Canadian forces during the war, being commissioned a second lieutenant in the Royal Flying Corps.

Sidney Dillingham, Akron representative of Duffy & Sears, crude rubber brokers, New York City, began his rubber career in 1915 in the Federated Malay States where he spent one and one-half years with a European plantation company. He joined the Firestone Tire & Rubber Co., Singapore, Straits Settlements, Ltd., Singapore, Straits Settlements, in 1917 and remained there until 1918, acting in the capacity of rubber inspector and buyer. He left Singapore in 1918, coming to America where he enrolled in an officers' training school. After the armistice he entered the crude rubber department of the Firestone Tire & Rubber Co., Akron, Ohio, recently resigning to accept his present position.

Dr. A. Pirelli has been elected president of the Italian *Società di Chimica Industriale* (Society of Chemical Industry) at Milan.

James Gustavus Whiteley, Belgian Consul at Baltimore, Maryland, has been appointed special representative in the United States for the Belgian Committee that is preparing, under the patronage of King Albert, the festival at Antwerp late this spring, to celebrate the Olympian Games.

H. H. Coleman, president of the Bergougnan Rubber Corp., Trenton, New Jersey, sailed for Europe on the steamer *La Lorraine*, January 20, to attend the annual Bergougnan convention at Clermont-Ferrand, France.

NEW JERSEY ZINC CO., INC., TO INCREASE PRODUCTION OF ZINC OXIDE AND LITHOPONE.

The New Jersey Zinc Co. announces that it will construct additional zinc oxide and lithopone plants to meet the growing demand for these products. Work will be started at once in Colorado and Pennsylvania. This company, said to be the oldest and largest zinc company in the United States, was organized in 1848 and includes among its properties the famous Franklin, New Jersey, mine which produces a pure zinc ore. The company is now operating zinc oxide, lithopone and slab zinc plants in Pennsylvania, Virginia, Illinois, Wisconsin, Kansas and Oklahoma. It has warehouses for its products in Brooklyn, Newark, Philadelphia, Pittsburgh, Cleveland, Chicago, Los Angeles, and San Francisco and intends to establish others. Its headquarters are in New York City and it has sales offices in Chicago and Pittsburgh.

With the manufacturing plants now in operation and those about to be constructed the company will be in a position to serve promptly and economically its trade throughout the country.

LINCOLN HIGHWAY ASSOCIATION ELECTS OFFICERS.

At the annual meeting of the Lincoln Highway Association, held recently in Detroit, Michigan, F. A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, Ohio, who has been president of the association for the past two years, refused to accept a third term, and Colonel Henry B. Joy, formerly president of the Packard Motor Car Co., who was the first president of the organization, was again unanimously elected president. Mr. Seiberling continues to be identified with the work of the association as one of its vice-presidents and a member of its executive committee.

The tire industry is further represented by J. Newton Gunn, president of the United States Tire Co., New York City, who was elected to the board of directors. Probably not less than \$12,000,000 will be expended on the improvement of the Lincoln Highway in 1920, and the permanent marking of the route from Omaha to New York will be completed.

EASTERN AND SOUTHERN NOTES.

THE Firestone Tire & Rubber Co., Akron, Ohio, has made the following changes in the personnel of its eastern and southern branches: W. M. MacNinch, manager of Baltimore, Maryland branch, succeeding B. R. Leisure, promoted to be district manager, with headquarters in Philadelphia, Pennsylvania; E. D. Manley, manager of Washington, D. C., branch, succeeding W. M. MacNinch; L. L. Heidacher, manager of Memphis, Tennessee, branch, succeeding G. K. Meeks, transferred.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has promoted B. P. Davis from the ranks of its salesmen to be manager of the McGraw branch at Memphis, Tennessee.

The Kokomo Rubber Co., Kokomo, Indiana, has purchased a site in Louisville, Kentucky, for its branch plant established there six months ago. It will build a two-story and basement structure, of which the lower floor will be occupied by the retail sales force.

The Katzenbach & Bullock Co., New York City, manufacturer and importer of chemicals and colors for the rubber trade, has opened a new office at 119 South Fourth street, Philadelphia, in charge of R. M. Smith.

The Stockwell Rubber Co., Inc., 229 North Twelfth street, Philadelphia, Pennsylvania, has been appointed sole agent of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts.

The Lineitime Manufacturing Co., Inc., Rochester, New York, manufacturer of the "Line-a-Time" copolymer having a number of rubber parts, has increased its capital from \$50,000 to \$150,000.

The Philadelphia Rubber Works Co., Philadelphia, Pennsylvania, is to erect a \$4,000,000 reclaiming plant at Buffalo, New York, where it has purchased 97 acres of land on the Niagara river road. Construction has already begun on the first unit, which will have a capacity of 2,000,000 pounds per month finished weight of reclaimed rubber. The reasons given for going to Buffalo are the land available and the proximity to the water power of Niagara Falls. The company's plant at Akron will be maintained, the one at Buffalo being intended to take care of future expansion.

Tyrus Cobb, the baseball player, has been signed as a salesman for the Ty Cobb-Bill Sanford Tire Co., of Augusta, Georgia, distributors of Goodrich tires in the South.

The Courier Rubber Co., Inc., 150 Nassau street, New York City, has been established to push the sale of the Courier red floating inner tube. The officers are Robert E. Clift and William D. Laurie, president and vice-president, respectively, both formerly with Frazer & Co., 30 Church street, New York City, and Paul Cooksey, secretary and treasurer.

The Overman Cushion Tire Co., Inc., 250 West 54th street, New York City, will build a two-story addition to its factory, 50 by 138 feet, for use as a machine shop, service station, assembling and painting. It is expected that the new structure will be finished by May 1.

The K., F. & C. Tire & Rubber Corp., Roanoke, Virginia, has recently purchased 15 acres of property, with several buildings of reinforced concrete, at Roanoke, as a unit of its factory for the manufacture of its cord tire, which is neither a solid, pneumatic nor cushion tire, but a built-up tire of rubber, cords and cord fabrics such as are used in pneumatic tires. This was described in THE INDIA RUBBER WORLD, August 1, 1918. The company has patents in the United States, Great Britain, Canada and the other British colonies, France and Italy, and has applied for patents in other countries. The company expects to install \$200,000 worth of machinery during the coming summer.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has elected the following officers for the ensuing year: directors—Herbert DuPuy, H. Wilfred DuPuy, Charles M. DuPuy, Seneca G. Lewis, and George W. Daum; Herbert DuPuy, chairman of the board; H. Wilfred DuPuy, president; Charles M. DuPuy, vice-president; Seneca G. Lewis, vice-president and general manager; George W. Daum, assistant general manager; A. H. Price, treasurer; George W. Shively, secretary; James Q. Goudie, general sales director; C. G. Morrill, assistant treasurer; H. H. Salmon, purchasing agent.

In order to insure the carrying out of plans now under way for expansion in proportion to growth and to stabilize the policies of the company, a definite arrangement was made to retain Mr. Lewis for five years more, he having already completed ten years of service. As heretofore, the business will be built from the inside out and men and women promoted from the ranks when possible. Mr. Lewis is of the opinion that new plants should be built only to take care of the demand for the company's products and not before the business to run them has been obtained.

The Allen Machine Company, of Erie, Pennsylvania, has opened a New York office at 17 West 42nd street in order to care properly for their eastern and export trade. Morris A. Pearson, who is a well known rubber machinery engineer, is in charge.

The Akron Tire Co., Inc., Honeywell street and Skillman avenue, Long Island City, New York, has changed its name to Akron Overland Tire Co. and increased its capital stock \$750,000. It was incorporated in October, 1919, under the laws of Delaware, with 100,000 shares of stock without nominal or par value.

The Farrel Foundry & Machine Co., Ansonia, Connecticut, has purchased at Buffalo, New York, where it will establish a new branch, the "Victory" turbine plant of the Bethlehem Shipbuilding Co. at Vulcan avenue and the New York Central railroad, at a cost of \$431,000. This includes power plant, of-

FARREL FOUNDRY & MACHINE CO.'S BUFFALO PLANT

fice, restaurant, welfare and hospital buildings, in addition to the main building 225 by 700 feet, and 12 acres of land. The company has also acquired 33 additional acres of land for expansion.

The Poole Engineering & Machine Co. has removed its general sales office from 50 Church street, New York City, to its works at Baltimore, Maryland, where mail should be directed. It will still maintain a district office at the New York City address, however.

Taintor Trading Co., Inc., 9 State street, New York City, has incorporated to do a general trading business including the importation of chalk, English clifstone, china clay, etc., under the management of Starr Taintor, president.

The Sinclair Rubber Co., Inc., 1679 Broadway, New York City, incorporated in September, 1919, has a factory at 2864 Webster avenue, where it manufactures a rebuilt tire which is intended to counteract the popular impression that rebuilt tires are unsatisfactory.

H. Schatia & Co., 100 Fifth avenue, New York City, are selling an Australian wool-filled fabric to manufacturers of raincoats in this country. It is of especially shaggy texture of a type current in prevailing English overcoatings and ulster cloths and offers in ten different shades. The manager of the fabrics for rubber clothing department is R. G. Bryant, a son of Geo. C. Bryant, formerly manager of the Chicago Rubber Clothing Co., Racine, Wisconsin, now operating in rubber clothing in Milwaukee under his own name.

RUBBER DIVISION OF THE AMERICAN CHEMICAL SOCIETY.

The Rubber Division of the American Chemical Society will meet in St. Louis, Missouri, April 14-15, and extends an invitation to all rubber chemists and technologists to attend. Since the rubber chemist has ordinarily to deal with technical problems not entirely chemical, much material is usually presented at these meetings which is of general interest. One such item to be discussed at the next meeting is the report of the committee on "Physical Testing."

Authors desiring to submit papers for presentation at the meeting should send the titles of the papers, together with abstracts, to A. H. Smith, Research Laboratory, The Goodyear Tire & Rubber Co., Akron, Ohio, by March 25.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

BOSTON NOTES.

AS A RESULT of the exceptionally severe winter weather and series of blizzards which have visited this section during the past month, instances of profiteering in overshoe sales by retail dealers in the down-town district of Boston have been reported by inspectors for the state commission on necessities of life, acting on a communication from Thomas J. Boynton, United States district attorney. Taking advantage of the abnormal conditions and a shortage of rubber footwear, some dealers were charging \$5.50 or \$6 a pair for overshoes that cost only \$3.50 a pair. The usual and fair profit on such footwear, the commission asserts, is \$1 per pair.

The Firestone "Ship by Truck" movement is being energetically organized and advertised throughout New England, and shippers are invited to make use of the information being compiled by the Firestone Ship by Truck Bureau at 656 Beacon street, Boston. Fourteen routes radiating in all directions from "the Hub" have been scheduled and large space in the local press is being devoted to listing the truck transportation companies operating on the various routes. The Massachusetts routes embrace Lowell, Springfield, Greenfield, Lynn, Brockton, Fall River, Haverhill and Lawrence, Marlboro and Hudson, and Cape Cod points. Other routes are to New York City, Philadelphia, Pennsylvania, Providence, Rhode Island; Manchester, New Hampshire, and Portland, Maine. Every route covers numerous smaller intermediate cities.

The employees' association of the Boston branch of the United States Rubber Co. held a most successful dance at Heineman Academy, Somerville, late in January. Some 400 persons were in attendance, including executives of the company. Novel dance numbers and other unusual features provided special entertainment. The committee in charge included Helen Cullen, Agnes M. Lintaman, Margaret H. O'Brien, Charles P. Abbott, A. A. Lappin and Roger Hewins.

The Hood Tire Sales Co., with stores at 1041 Commonwealth avenue, Boston, and in Watertown, selling Hood tires and tubes exclusively at wholesale and retail, has opened a downtown Boston branch in Park Square at the corner of Church street. Lewis B. Clay is in charge. D. J. MacNichol, president of the company, states that other stores will be opened at suitable locations can be secured.

At the annual meeting of the Franklin Rubber Co., 134 Federal street, Boston, held February 4, the following officers were reelected for the ensuing year: Asa C. Merrill, president; Everett L. Fuller, treasurer; Lorin L. Fuller, assistant treasurer. The company had a very successful year and is anticipating a large increase for 1920.

The Gillette Rubber Co., formerly at 110 Federal street, Boston, has sold its furniture and fixtures and gone out of business.

The recently organized Holland System Trading Corporation, 949 Commonwealth avenue, Boston, has become the exclusive New England distributor for the Overman cushion tire for trucks and is seeking live agents in every city of this territory.

Coburn, Kittredge & Co., 10 State street, Boston, is among the New England investment houses now specializing in rubber company securities.

H. O. Allyn, for several years at the head of the Springfield branch of the Pennsylvania Rubber Co., has been promoted to manager of the Boston branch. Mr. Allyn brings to his larger work long experience in the tire industry and an enviable record of able salesmanship.

The Boston branch of The Fisk Rubber Co. has a new manager in the person of Corliss Wadleigh, who has resigned as manager of the eastern department of the Youngstown, Ohio, or-

ganization of the Republic Rubber Corp., to assume his new duties. Mr. Wadleigh originally came from the Knox automobile sales forces, and although young in years is old in tire experience and has a wide acquaintance throughout New England.

L. Arthur Watkins, one of Boston's best known automobile accessory men, has been appointed to the New England district managership of the Globe Rubber Tire Manufacturing Co., with headquarters in Boston, succeeding A. H. Lane, who goes to the factory at Trenton, New Jersey, as distributors' representative.

The Madison Tire & Rubber Co., Inc., 30 East 42d street, New York City, has arranged to occupy the building at 859 Boylston street, Boston, now occupied by The Miller Rubber Co. This will be a direct factory branch in operation on March 1, in charge of J. H. Connor, formerly manager of the accessory department of the Packard Motor Car Co. of New England.

MISCELLANEOUS MASSACHUSETTS NOTES.

The Boston police appear to have unearthed a well organized plot to steal rubber goods from the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, obliterate the firm's name from the goods and then dispose of them through jobbing houses. Hose worth from \$8,000 to \$12,000 was seized in a Causeway street cobbler's shop and in the buildings of a High street concern by which it is alleged the hose had been distributed. It is believed, however, that systematic thefts have been in progress since last October, and that rubber goods worth \$50,000 have been taken.

Following its usual custom, the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, on December 31, 1919, through its president, George E. Hall, presented gold pieces to such of its employees as had been with the company ten years or longer. Work was stopped at four o'clock and special exercises held, including a concert by the company band, an address of welcome by J. William Fellows, factory manager, and community singing.

Under the auspices of the Business Training Corporation, of New York, the Converse Rubber Shoe Co., Malden, is conducting a school for foremen and executives. The classes meet every two weeks, at which time the men get together at dinner to discuss problems in connection with their work. Among the subjects taken up are teamwork, handling labor, organization, machinery and materials, cost records.

At a meeting of the directors of the Plymouth Rubber Co., Canton, late in January, several of the former directors resigned, including the treasurer, J. E. Stone. A new board of officers and directors was then elected as follows: president, James J. Clifford; treasurer, Ronald T. Lyman; directors, James J. Clifford, Ronald T. Lyman, Nathan L. Amster, W. Lloyd Allen, Daniel H. Harris, W. F. Edlefsen and John Sweetser. John J. Batterman, who has been handling the sale of Toesans for the company for some time past, was appointed sales manager.

The ebonite bowling balls made by the Stowe & Woodward Co., Newton Upper Falls, Massachusetts, have sold well this season in spite of prohibition, which was expected to interfere with the sport of bowling, as many alleys were attached to saloons. Robert J. Wilkie, who is connected with the company and is the originator of the ebonite bowling ball, states that some of these hard rubber balls have been used constantly for ten years.

The Athol Manufacturing Co., Athol, Massachusetts, has reorganized its Metropolitan Air Goods Department under the firm name of Metropolitan Air Goods Co., with L. S. Starrett as president and R. A. Whall, treasurer and manager. A two-story cement building will be erected as soon as weather permits, with every modern facility for making up pneumatic rubber goods, to take care of the increased business of this department.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE RUBBER MILLS throughout the state have been handicapped during the past month by the heavy snow-fall, ice and other weather conditions. All were hampered through the inability of employes getting to the plants on account of the impassable highways and by the freight embargoes which curtailed the shipping of materials and production.

The difficulty in moving supplies reached the climax in the great storm at the beginning of February and most of the plants were hard pressed for raw material. The National India Rubber Co. at Bristol was obliged to close its rubber shoe division for about a week, laying off more than 3,500 hands, naphtha being the principal commodity needed. But use was made of the men in clearing the highways between the plant and Warren, a distance of about five miles, to afford an outlet for the company's freight.

Besides these the general outbreak of influenza throughout the state was responsible for many employes not reporting for work. In several departments in some of the plants as high as 50 per cent were out at the height of the outbreak, and a number of deaths were recorded.

The Mount Hope Spinning Co., which manufactures fine yarns for tire fabric, at Warren, Rhode Island, is going to build a new mill in that town and work will be started as soon as the weather conditions permit. The new mill, which is to be located alongside the company's present plant on Cutler street, will be 200 feet in length and 110 wide and two stories in height.

The Mount Hope Spinning Co. a few years ago purchased one of the mills with storehouses and other mill buildings from the Cutler Mills Co., completely renovating all the property, and installed new machinery throughout. It has prospered from the start and for more than a year now the plant has been operated at capacity both night and day. When the new mill is completed the company will be in a position to double its output. This company also controls mills in Taunton, Massachusetts, and other places.

The Lynn Rubber Co., Warren, has absorbed the Morrison Brothers Heel Co., Boston, and in the future will manufacture not only rubber heels but other articles, such as arch supporters, etc. The consolidation of these two plants will double the capacity of the Lynn Rubber Co., and preparations are being made so that the plant can be operated day and night.

The annual meeting of the stockholders of the Lynn Rubber Co. was held at Warren, February 7, when the following directors were elected: Elmer K. Watson, J. William Long, Walter J. Howland, Clarence H. Seymour and Leonard P. Bosworth. At a subsequent meeting of the directors, J. William Long was elected president and Elmer K. Watson, treasurer. William Wheeler and F. M. Cartland, former president and treasurer, respectively, will in the future represent the company on the road and also serve in advisory capacities. No dividend was declared at the meeting.

The offices of the Lynn Rubber Co. will for the present remain in the Wilmarth building, on Main street, Warren, but in the near future accommodations will be made for the offices of the concern at the plant on Cutler street. Mr. Long, the new president, has a thorough knowledge of the business coming from Stoughton, Massachusetts, where he has been employed for several years as superintendent and head chemist with the Panther Rubber Co.

John F. Sweeney, who has been acting plant manager of the American Winger Co.'s factory, Woonsocket, since the resignation of W. Maxwell Reed, some time ago, was made plant manager early the past month at the meeting of the directors. Mr. Sweeney has been with the American Winger Co. since 1889, when he entered the employ of the concern as office boy and

gradually worked his way up to his present position. He states that the plant is facing the most phenomenal year of its existence. Last year 500,000 wringers were turned out and this year it will be no surprise if 1,000,000 are made.

Henry C. Wagner, factory manager of the Woonsocket Rubber Co.'s plants in Woonsocket (the Alice Mill) and of the Manville Mills, at Manville, has been appointed general assistant to Myron H. Clark, general footwear factory manager of the footwear division of the United States Rubber Co. Mr. Wagner assumes his new duties March 1. Henry S. Marlor, now superintendent of the Lyeonring Rubber Co. at Williamsport, Pennsylvania, will succeed Mr. Wagner as the factory manager of the Woonsocket Rubber Co.

Mr. Wagner started with the Meyer Rubber Co., at Milltown, New Jersey, and then went to Bristol, Rhode Island, where he occupied an executive position with the National India Rubber Co. He remained there three years and then went to Woonsocket, where he has been a resident for 15 years. He has served as superintendent at the Millville rubber boot mill at Millville and as superintendent of the Alice rubber shoe mill at Woonsocket at different times, and for a number of years has been factory manager and has been in charge of both of the Woonsocket Rubber Co.'s mills.

It is understood that The Ninigret Co., Pawtucket, manufacturers of fabric for automobile tires, contemplates the erection of a large addition to its present plant which was purchased about six months ago from the Greene & Daniels Co., since which time it has been running night and day to fill its orders which are said to be accumulating faster than they can be filled.

Employes of the Davol Rubber Co., Providence, have formed a mutual benefit association under the direction of the welfare department of the company, and a fund of \$500 has been appropriated by the company in order that the association may start in a prosperous condition. Although membership is not compulsory, it is expected that a majority of the employes will join. Sick benefits will be paid at the rate of \$1.25 per day for a period not exceeding 13 weeks and the death benefit will be \$100. Group insurance was instituted by the company nearly two years ago.

The trade certificate of the Elliott Tire Shop, 143 High street, Pawtucket, has been filed at the city clerk's office, giving the name of Walter E. Elliott as owner.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

THE WILL of Alfred Whitehead, secretary of the Whitehead Brothers Rubber Co., Trenton, has been admitted to probate in the office of the surrogate at Trenton. He left his entire estate to his widow. The real estate is valued at \$20,000 and no inventory of the personal estate was filed.

The Empire Rubber & Tire Co., Trenton, has elected W. G. Heath and F. I. Reynolds to fill the vacancies on its board of directors caused by the resignations of J. E. Baum and J. Cornell Murray. W. M. Pepper has been elected president, succeeding Mr. Baum; F. I. Reynolds, vice-president; C. Edward Murray, Jr., vice-president and treasurer; H. R. Nason, secretary. The board of directors is as follows: General C. Edward Murray, chairman; W. D. Campbell, W. M. Pepper, W. G. Heath, C. Edward Murray, Jr., J. Frazier and F. I. Reynolds.

Associated with Mr. Reynolds are: W. A. Reynolds, former sales engineer of the mechanical rubber goods division of the United States Rubber Co.; J. Baker Taylor, former general eastern district sales manager of the tire jobbing department of the United States Rubber Co., and R. V. Dickinson, who formerly occupied a similar position in the West for the same company.

S. H. Smith, formerly factory manager of the Gillette Rubber

Co., Eau Claire, Wisconsin, has been appointed factory manager of the Empire Rubber & Tire Co., Trenton.

J. Cornell Murray, formerly treasurer and a director of the Empire Rubber & Tire Co., Trenton, has associated himself with The Crescent Insulated Wire & Cable Co., Trenton.

The Crescent Insulated Wire & Cable Co., Inc., Trenton, has contracted for a one-story addition to its factory, 50 by 132 feet.

W. E. Sanders, of the Essex Rubber Co., Trenton, recently gave an address on "Rubber" before the Trenton Knights of Columbus. He told of the various processes the material goes through from the tree to the finished products.

The Delton Tire & Rubber Co., of Baltimore, Maryland, which purchased the name and good will of the Delton Tire & Rubber Co., of Trenton, is preparing plans and specifications for its new building. A nine-acre tract of land has been purchased along the West Shore railroad, where the erection of the new buildings will begin at an early date. The plant will cost more than \$200,000, including buildings and power equipment.

The annual meeting of the Woven Steel Hose & Rubber Co., Trenton, was held February 2, when the following directors were elected: John S. Broughton, Karl G. Roebeling, Horace B. Tobin, all of Trenton; John H. Janeway, of New York City, and Albert Rogers, of Philadelphia, Pennsylvania. The directors will meet later to elect officers.

John S. Broughton, president of the United & Globe Rubber Co., Trenton, has been appointed one of the commissioners to condemn land for the city for the erection of a new city wharf.

Bruce Bedford, president of the Luzerne Rubber Co., Trenton, and Mrs. Bedford will leave here early in March for a trip to Jamaica, West Indies, for several weeks.

Bruce Bedford, president of the Luzerne Rubber Co., has been appointed a member of the Trenton City Planning Committee, to aid in the development of Trenton.

William J. B. Stokes, J. Oliver Stokes and General C. Edward Murray, prominent rubber manufacturers of Trenton, have each contributed \$25,000 towards the erection of a new \$500,000 home for the Young Men's Christian Association. Clifford H. Oakley, president of the Essex Rubber Co., and C. Edward Murray, Jr., second vice-president of the Empire Tire & Rubber Corp., each contributed \$500, while Horace L. Boyer gave \$1,000. Horace B. Tobin, secretary and treasurer of the United & Globe Rubber Co., gave \$500. General Murray was chairman of the general committee and spent considerable time in the work.

The Joseph Stokes Rubber Co., Trenton, will build a steel and brick addition to the plant on Taylor street. The structure will be two stories, 70 by 100 feet, and will cost \$35,000.

Plans are being drawn for a three-story brick and steel building for the Ajax Rubber Co., Inc., Trenton. The structure will be 60 by 350 feet and will cost \$39,000.

MISCELLANEOUS NEW JERSEY NOTES.

The Sterling Tire Co., Rutherford, New Jersey, has increased its capital from \$2,500,000 to \$3,700,000. The company has 19 factory sales branches.

The Smith Rubber & Tire Co., Inc., 625 Main avenue, Passaic, New Jersey, has broken ground at Garfield, New Jersey, for its cord tire factory which is to be two stories high, 60 by 200 feet, with an initial daily capacity of 600 cord tires. The excavating and grading has been completed, the concrete foundations put in, and the concrete forms for the corner posts and side walls partially constructed. Machinery and equipment has been ordered and the date for delivery set. It is hoped the factory will be in operation by May 15.

The officers are: Winfield Clearwater, president; Fred W.

Smith, vice-president; Dudley Gordon, secretary, and Thomas A. Hopkins, treasurer.

The Zee-Zee Rubber Co., Yardville, New Jersey, has increased its capital from \$1,000,000 to \$5,000,000 and expects to open 50 chain stores this year in addition to those already in operation. Irvin Zimmerman is president.

William G. Zimmerman, vice-president of the Zee-Zee Rubber Co., Yardville, who has been ill of pneumonia for several weeks at his home, has recovered and is now able to be about again.

The National Oil Products Co., Harrison, New Jersey, has elected M. A. Richards, formerly vice-president, its president, succeeding the resignation and withdrawal from the company of Arthur Phillips, the former president.

The Gibraltar Tire & Rubber Co., New York City, is having plans drawn for a modern rubber plant to be located in West New York, New Jersey. The plot has a frontage along the Hudson County boulevard of 90 feet and a depth of 150 feet. The company will engage in the manufacture of tires.

MILLER TIRE REPAIR SCHOOL A SUCCESS.

Many prominent tire men believe the time is not far distant when it will be necessary for the tire repair men to show proof of training and study under competent authority. Already there are being operated in Akron, Ohio, a few tire repair schools, among the largest of which is that conducted by The Miller

A SCHOOL FOR TIRE REPAIR MEN.

Rubber Co. This institution has averaged 35 graduates a month since last August and plans are nearly completed for doubling the size of the school.

Every graduate of the Miller school receives a diploma certifying that he has finished the regular course of instruction, consisting of lectures, text-book study, and practical repair work. The student is first made thoroughly acquainted with the details of tire construction before he is actually trained in repair work. Repair stocks, fabrics of all descriptions, air bags, vulcanizing machines and methods, common sources of tire trouble, etc., are among the subjects taken up. The chief instructor and his assistants in the school are thoroughly experienced tire men from both the factory and retail business standpoints.

Because of the great demand for the training, the course has been made as brief as is consistent with turning out expert tire repair men. It is said that the average man can complete it in a month. Some, however, require longer training. None is given a diploma until his work has passed the necessary high average standing. The wide interest taken in the school is evidenced by the class roll which shows students from nearly all of the states in the union.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

COVENTRY—AKRON'S NEW INDUSTRIAL CITY.

AN INTERESTING EXAMPLE of systematic and intelligent town planning is being carried out in the heart of the rubber district of Ohio, midway between the cities of Akron and Barberton, in the region known as "Greater Akron." It cannot be called an experiment because William A. Johnston, president of the Rubber Products Co., for many years has been developing the land in the vicinity of the Portage lakes into residential and industrial settlements, with the assistance of experienced landscape architects and of other experts, and already has Allenside and other communities to his credit.

For the present enterprise Mr. Johnston bought a tract of 350 acres of level ground, lying between the yards of the Pennsylvania and of the Erie railroads that serve the great rubber factories of the Akron district, together with the Belt line, on the one hand, and the bend of the Tuscarawas river on the other, and named the place Coventry. Across the river lies Allenside.

The industrial end of Coventry has two miles of double portage on the Belt line, and is within easy walking distance of the Firestone Tire & Rubber Co.'s immense plant, of the Miller Rubber Co.'s reservation for new buildings, and of that of the Akron Rubber Mold & Machine Co. The Rubber Products Co.'s buildings are across the railroad track. The plan provides for mills and factories, schoolhouses, churches, motion picture theaters, a community center, business streets with restrictions on the buildings, a stadium, streets, sewers, water and all modern conveniences, and 1,500 house lots.

The accompanying aeroview shows not only the location of the town in reference to the neighboring rubber centers and to its own corner of Ohio, but also the astonishing number of noted rubber establishments that are grouped about it. It will be interesting to watch the career of the new-born Coventry.

AKRON NOTES.

Rubber manufacturing concerns in Akron are holding surpluses amounting to approximately \$125,000,000 from distribution until the Supreme Court decides whether stocks issued against these surpluses are subject to the excess profits tax. If the Supreme Court hands down a decision permitting the issuance of the stocks without making them taxable, most of the rubber companies will issue stock. If the court holds they are subject to taxation, no par value shares will be issued.

Rubber manufacturers, builders and real estate men predict that Akron will become a city of tents and barracks this sum-

mer when the \$40,000,000 construction program gets under way. There is not a man in the city of Akron out of work now, and there is scarcely a room, not to speak of a house, vacant in the city.

If the work planned for this year, both in the rubber industry, city building and the building of private residences is to be undertaken at all, the men to do the work must be brought to Akron from other cities and the only place for them to live while they are working will be in tents and barracks.

The Coventry Land & Improvement Co., subsidiary to the Firestone Tire & Rubber Co., will begin its building program in Firestone Park this spring with 300 new homes.

Rubber footwear factories have reported that a large number of representatives from Europe are coming to Akron to make

contracts for the needs of their countries. The scarcity of leather has made the Europeans turn to rubber as the best substitute. Rubber heels and soles are especially in great demand in Europe, it is said.

Exports to foreign countries from Akron are now at the rate of approximately \$20,000,000 a year. But for the high rate of exchange the amount would probably be double this figure.

Announcement has been made that Plant No. 2 of The B. F. Goodrich Co. will

be ready to produce 3,000 tires daily, of small dimensions, within the next few weeks.

The Firestone Tire & Rubber Co., Akron, is educating its office employees by means of motion pictures. Sixteen films have been produced by the Division of Films, including "Most Miles Per Dollar," "The Rubber Industry in Malaysia," and "For the Common Good." Each series consists of five reels.

C. L. Mason, formerly western service manager, has been appointed manager of the north central district of the Firestone Tire & Rubber Co., with headquarters at Akron.

The General Tire & Rubber Co. is completing plans to take over permanently the coal mine which it leased during the coal strike and operated with rubber workers. Thirteen miles of track must be laid to the company's plant in order to produce and deliver coal economically.

The stockholders of The Miller Rubber Co. have approved the proposal of the directors that the capitalization of the company be raised from \$20,000,000 to \$60,000,000. The immediate issuance of \$10,000,000 worth of the preferred stock has been decided upon. The business for the past year aggregated \$26,495,482. Profits for the year amounted to \$2,193,547.

The Mohawk Rubber Co., Akron, has increased its capitalization from \$2,000,000 to \$5,000,000. The purpose for which the

funds derived from the sale of the stock will be used has not been announced.

The Amazon Rubber Co. has been bought by a syndicate headed by Dr. E. E. Quirk, an Akron financier. The capitalization of the company is to be raised from \$400,000 to \$1,500,000 in order to finance a material increase in the output of the company. A new site has been obtained and the first unit of a new plant will be built this year.

The Doyle Tire & Rubber Co., Doyle Block, Akron, has organized with the following officers: Dayton A. Doyle, Jr., president and treasurer; Myron J. Sophy, vice-president and sales manager; F. H. Kelsey, vice-president; and Arthur W. Doyle, secretary.

The company will build a factory one story high with basement, 410 by 54 feet, on the Baltimore & Ohio railroad, in the suburbs of the East Akron district.

The H. B. Bixler Co., Ohio Building, Akron, organized by H. B. Bixler, a consulting engineer, has taken over and is operating the Denmead Rubber Co., a heel manufacturing company. The consideration for the plant is said to have been \$160,000.

The following changes in personnel have been made at the factory of The Goodyear Tire & Rubber Co., Akron: James E. Hale, appointed manager of the rim and wheel department; William S. Wolfe, promoted from technical service division to head of tire design division; Walter B. Keith succeeding Mr. Wolfe.

With the promotion of I. R. Bailey, manager of the mechanical goods department of The Goodyear Tire & Rubber Co., to the position of assistant sales manager, two other changes in the Goodyear organization are announced. D. R. Burr, formerly assistant manager of the mechanical goods department becomes manager as successor to Mr. Bailey. Mr. Burr in turn is suc-

ceeded by C. A. Jones who has served as manager of the hose, railroad supplies and rubber band departments of the mechanical goods division.

ceeded by C. A. Jones who has served as manager of the hose, railroad supplies and rubber band departments of the mechanical goods division.

C. A. Jones is a "rubber city" product. He was born and educated in Akron, joining the Goodyear company eight years ago. Prior to that time he was with other rubber concerns in estimating cost work on rubber specialties and as assistant in charge of production. Mr. Jones joined Goodyear when the

mechanical goods department consisted only of molded goods such as tiling, bumpers and rubber soles and heels, and sold the first thousand pairs of Goodyear rubber soles to shoe manufacturing concerns.

Nineteen nineteen, was a record business year for the Miller Rubber Co. of Akron, Ohio, sales having increased nearly \$10,-

PLANT OF THE MILLER RUBBER CO., AKRON, OHIO.

000,000 over the previous year. The sales which amounted to \$1,914,443 in 1913 have risen to \$16,522,707 in 1918 and \$26,495,482 in 1919; it is now anticipated that in 1920 they will be at least \$40,000,000. During 1919 new branches were established in Albany, New York; Cedar Rapids, Iowa; Charlotte, North Carolina; El Paso, Texas; Erie, Pennsylvania; Great Falls, Montana; Jacksonville, Florida; Memphis, Tennessee; Oakland and San Francisco, California. Since January 1, 1920, branches have been opened in Cincinnati, Ohio, and Phoenix, Arizona, and the establishment of branches in twelve other cities is being considered.

The Akron shops of the Wellman-Seaver-Morgan Co. have taken on a complete line of rubber machinery and owing to the unprecedented demand they have run to full capacity for practically the entire year. The orders now booked will keep the shops running from six to seven months at the same rate, and to make deliveries some of this work has been transferred to the Cleveland shops.

CLEVELAND NOTES.

The Osborn Manufacturing Co., 5401 Hamilton avenue, Cleveland, has acquired the charter of the New York corporation of the same name. In November last, the Osborn company increased its capital to \$2,000,000 and doubled its plant capacity. Branches and warehouses are maintained at New York, Detroit, San Francisco, Milwaukee, and Chicago. The company also maintains its own representative on foundry molding machines in Europe, in addition to its agencies which include The Allied Machinery Co. of America in France and Italy; Isbecque & Co. in Belgium; and J. W. Jackman & Co. in England.

The Owen Tire & Rubber Co., Cleveland, will increase its capital stock from \$1,750,000 to \$3,000,000 for the purpose of obtaining additional working capital and adding to its plant and equipment. It expects to have its new building ready for occupancy about July 1.

The Zenith Tire & Rubber Co., Leader Building, Cleveland, expects to build a factory in Cleveland for the manufacture of tires and tubes.

C. A. JONES.

I. R. BAILEY.

D. R. BURR.

The Paralite Co. removes on March 1 from 609 Sweetland Building to its new building at 1684 Columbus Road, Cleveland.

J. M. Bushey, formerly truck tire sales manager in Cincinnati, has been appointed Cleveland manager of the Firestone Tire & Rubber Co., Akron, vice P. M. Pontius, resigned.

MISCELLANEOUS OHIO NOTES.

The Firestone Tire & Rubber Co., Akron, has made the following changes in personnel in two of its Ohio branches: Cincinnati—J. P. Patterson, former manager, appointed manager of south central district, with headquarters in Cincinnati; J. F. Evans, formerly trade sales manager, appointed manager of Cincinnati branch, succeeding Mr. Patterson. Toledo—G. F. Guin, formerly trade sales manager, appointed manager, succeeding G. E. Burkit, transferred.

The New Tread Tire Co., Columbiana, Ohio, at its annual meeting of stockholders voted to increase the capital stock from \$100,000 to \$500,000 to be issued in equal lots as to preferred stock.

This is for the purpose of installing the necessary machinery and equipment for manufacturing a new tire. The following directors were elected for the ensuing year: S. W. Tidd (president), C. V. Calvin (secretary and treasurer), E. P. Altenburg (vice-president and general manager), E. L. Dieffenbacher, H. W. Hammond, W. O. Wallace, C. R. Heck, O. W. Altenburg. Officers were elected as indicated.

ERIC P. ALTENBURG.

The Rotary Tire and Rubber Co., Zanesville, Ohio, has increased its capital stock from \$400,000 to \$800,000. It began the operation of its new factory in October last and has a capacity of 300 tires a day, which the former capital was insufficient to finance.

The Eagle Rubber Co., Ashland, Ohio, has completed a new fireproof addition which doubles its floor space and capacity. This plant is equipped with modern machinery and ventilating appliances for manufacturing on a scientific basis and safeguarding the employees' health.

HEAD OF AJAX SANDUSKY PLANT.

WILLIAM W. McMAHAN, who has been appointed vice-president in charge of the Sandusky, Ohio, division of the Ajax Rubber Co., Inc., is a veteran in the tire field.

In 1897 he entered the employ of Morgan & Wright, Chicago.

He was soon made factory foreman, then factory inspector, then assistant superintendent and, in 1911, general factory superintendent. For nine years after joining Morgan & Wright, Mr. McMahan remained in Chicago. Then he was transferred to Detroit, where he remained until he was secured by Ajax Rubber Co., to assume complete charge of its Sandusky plant. In recent years Mr. McMahan has been general factory manager of the Morgan & Wright division of United States Rubber Co., first in charge of general production and later in charge of development.

WILLIAM J. McMAHAN.

MID-WESTERN NOTES.

By Our Regular Correspondent.

STRESEN-REUTER & HANCOCK, INC., Chicago, Illinois, chemical manufacturer and broker, has elected the following officers for the ensuing year: F. A. Stresen-Reuter, president; A. S. Procter, vice-president; J. L. Biser, secretary and treasurer.

Mr. Stresen-Reuter, the newly-elected president, sailed from New York in January for an extended European business trip. Mr. Biser is in charge of the Chicago office in his absence.

The Birch Hintz Manufacturing Co., 1100-1110 South Kilbourne avenue, Chicago, Illinois, has dissolved partnership. John C. Hintz has severed connection with William T. Birch and will continue at the above address the manufacture of rubber molds and rubber mold machinery, under the name of The Hintz Manufacturing Co.

The Ilg Electric Ventilating Co., Whiting and Wells streets, Chicago, Illinois, has nearly completed an H-shaped two-story addition, approximately 200 by 300 feet, of concrete, which it expects to occupy by May 1. The company recently purchased the 10-acre tract of land on which the building stands and has provided for its water supply by an artesian well 200 feet deep. Oil-burning boilers will be installed in the factory and the company's own "Ilgair" unit heater system. This is the first of five units planned for erection during the next few years.

H. Thorpe Kessler has resigned as general manager of the Kinzie Rubber & Manufacturing Co., Chicago, Illinois, to manage the Modern Merchandising Co., a new Illinois corporation which he has founded and of which he is president. The new company deals in wearing apparel, including raincoats.

The Firestone Tire & Rubber Co., Akron, Ohio, has made the following changes in personnel in its mid-western branches: St. Louis—T. J. Barry, Manager, succeeding F. C. Rudisell, resigned; Denver, G. K. Meeks, manager; Detroit—G. E. Burkit, manager, succeeding R. H. Jeffers, promoted; Indianapolis—C. T. Barnes, manager, succeeding L. R. Jackson, promoted; Duluth depot—J. L. Bain, manager.

A controlling interest in the Mid-Continent Tire Manufacturing Co., Wichita, Kansas, has been purchased by The Zenith Tire & Rubber Co., Leader Building, Cleveland, Ohio, from which point most of the purchases for the Mid-Continent factory will now be made.

The International India Rubber Corp., South Bend, Indiana, has elected the following officers for the ensuing year: George W. Odell, president and treasurer; P. E. Studebaker, vice-president; B. F. Wulff, secretary, and G. W. Truxell and J. W. Ridge, directors, in addition to the foregoing.

THE MID-WEST RUBBER ASSOCIATION.

The February meeting of the Mid-West Rubber Manufacturers' Association was held at the Chicago Automobile Club, February 11, and was one of the largest and most enthusiastic that has been held by this association since its organization a year ago.

The new president, John T. Christie, of the Hawkeye Tire & Rubber Co., Des Moines, Iowa, was in the chair, and introducing the new general manager, H. S. Vorhis, formerly of The Rubber Association of America, and more recently of the Gutta-Percha & Rubber Manufacturing Co., New York City. Mr. Vorhis in a brief address outlined some of his plans for the development of an aggressive and helpful rubber association in the Middle West, and bespoke the cooperation of the entire membership to this end.

President John T. Christie then called upon a number of those present for brief remarks, among whom A. W. Caney, of The Achilles Rubber & Tire Co., Binghamton, New York, brought greetings from the Eastern contingent of the membership. W.

E. Byles spoke in an interesting manner of the proposed New York crude rubber exchange.

It was decided that future meetings of the association will be held on the second Tuesday of each month.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

SAN FRANCISCO NOTES.

THE UNITED STATES RUBBER CO., San Francisco Branch, has moved its headquarters from the location it has occupied for ten years at 50-60 Fremont street to its own building at 300-336 Second street, corner of Folsom. The structure is 137.6 by 275 feet, with two stories and basement, and is equipped in the most up-to-date manner. There is frontage on three streets and a spur track connects with the railroad.

The front of the second floor will be occupied by the executive offices of the Pacific Coast division which controls the operations of the fourteen Pacific Coast branches and, through a branch of the United States Rubber Export Co., Limited, the selling end of the company's business in the Hawaiian Islands, Alaska, Japan, India, Indo-China, the Federated Malay States, etc.

The Miller Rubber Co., Akron, Ohio, has opened a new branch in Oakland, across the bay from San Francisco. This is under the management of J. A. Hopkins, operating directly under the San Francisco branch. The territory includes several adjacent counties besides the City of Oakland.

The American Rubber Manufacturing Co., 356 Market street, San Francisco, manufacturer of mechanical rubber goods, is building an addition to its plant near Oakland. The estimated cost will exceed \$100,000 when completed, which it is expected will be about the middle of the year.

The Wellman-Seaver-Morgan Co., Cleveland, Ohio, which recently discontinued its Seattle office, is taking care of business in that territory through its San Francisco office at 201 Rialto Building.

The San Francisco team of the Firestone Tire & Rubber Co. recently won against 64 branches the A. G. Partridge championship trophy in the national telegraphic bowling tournament, by bowling 2,758 pins. The same team also won the L. G. Fairbank cup in the second game for the highest team score for a single game. This is said to have been the first national telegraphic bowling contest, but it is expected that it will become an annual affair, so much interest having been shown.

L. R. Jackson has been promoted from the position of manager of the Indianapolis branch to that of the Pacific Coast district of the Firestone Tire & Rubber Co., Akron, Ohio, with headquarters in San Francisco.

LOS ANGELES NOTES.

Burgess Darrow has been appointed head of the technical service division of the Goodyear Tire & Rubber Co. of California, Los Angeles.

The United States Compression Inner Tube Co., a \$5,000,000 corporation of Tulsa, Oklahoma, will erect a \$1,000,000 factory in or near Los Angeles as soon as a site is decided upon and building materials are secured. It will be essentially a replica of the main Tulsa plant, which gives employment to several hundred workmen and has an annual capacity of 150,000 casings and 300,000 tubes. M. C. Hale, president of the company, is in Los Angeles perfecting plans for the project, and offices of the Pacific Coast division of the company have been opened in the Citizens' National Bank Building by C. R. Privett, distributor for California, Oregon, Washington, Utah, Idaho, New Mexico and Arizona.

SOUTHWESTERN NOTES.

The Savage Tire Co. of San Diego, San Diego, California, has changed its name to The Spreckels "Savage" Tire Co. The officers are: John D. Spreckels, president; Raymond V. Morris, vice-president and general manager; Claus Spreckels, secretary and treasurer; Read G. Dilworth, general counsel. L. S. Chamberlain, former Pacific Coast manager, has been appointed sales manager.

Although automobile casings will be manufactured in the new plant, the principal feature of production will be a patented puncture-proof inner tube.

The Miller Rubber Co., Akron, Ohio, has opened a branch at Phoenix, Arizona, under the management of W. T. Smith.

The New York Rubber Co., 84-86 Reade street, New York City, has opened an office at 805 Franklin avenue, Houston, Texas.

The Fisk Rubber Co. of New York, Chicopee Falls, Massachusetts, has appointed C. C. Fletcher manager of its Texas district which includes San Antonio, Houston, Dallas and El Paso. Mr. Fletcher was for several years manager of the Fisk company's Oklahoma City branch.

For some years the Fisk Co. of Texas, now the Southern Equipment Co., handled the distribution of Fisk tires, together with accessories, in the State of Texas, but in December last The Fisk Rubber Co. of New York assumed the tire division, the Southern Equipment Co. taking over the accessory end. Practically the same personnel will be retained in the various Texas branches.

J. H. McDunnough, formerly district representative of the central district of the Firestone Tire & Rubber Co., Akron, Ohio, has been appointed manager of the southwestern district, with headquarters at Dallas, Texas.

NORTHWESTERN NOTES.

The Kelly-Springfield Tire Co., New York City, has opened a factory branch at 24-26 North Park street, Portland, Oregon, under the management of C. H. Mead. It also maintains other Pacific Coast branches at Seattle, Fresno, San Francisco and Los Angeles. The branch at Bakersfield, California, has been closed recently.

CANADIAN NOTES.

The United Shoe Machinery Co. of Canada, Limited, Montreal, Quebec, has in process of building a four-story factory addition, 60 by 120 feet. It is expected that the new building will be ready for occupancy about the first of April.

A million-dollar tire fabric plant, which will employ 1,000 hands, is to be built near Montreal by F. L. Jenckes, of the Jenckes Spinning Co., Pawtucket, Rhode Island, U. S. A., and other cotton men associated with him.

John Myles, general manager, and E. Larose, sales manager, respectively, of The Columbus Rubber Co. of Montreal, Limited, recently spent a week in Winnipeg on company business, with G. W. Barrett of the Winnipeg branch, and G. H. Connolly of the Calgary branch. Arrangements have been made to increase factory production to take care of the growing business of the company's western branches.

At the recent convention of the Shoe Manufacturers' Association of Canada, held in Quebec, an address on "A Freshman's Survey of Our Industry" was made by Talmor H. Rieder, president of Ames Holden McCready, Limited, Montreal, and one on "Machinery in the Shoe Trade," by F. W. Knowlton, president of the United Shoe Machinery Co. of Canada, Limited, Quebec.

The employees of the Halifax branch of the Dominion Rubber System had the first annual sleighing party and dance on the evening of February 2, at the close of which a supper was served with rubber terms cleverly substituted for possible French ones in the menu.

The Rubber Trade in Japan.

By Our Regular Correspondent.

TRADE ASSOCIATIONS in Kobe and Osaka, Japan, seem to be geographically destined to prosper in commerce and industry, and since the World War, the Japanese rubber industry has made remarkable development, particularly in Osaka and Kobe. Osaka is the commercial and industrial center of the southwest half of Japan, including Korea, Formosa and southern Manchuria. Tokio is commercially the center of the northeast half of Japan. These cities are the largest markets and the distributing points for all commodities in their respective sections of the Empire, while Osaka is at present the chief trading place with Chosen and China, all Oriental countries and the South Sea Islands. Kobe, situated near Osaka, is the largest open port in the western half of Japan, and the biggest trading port of the Empire.

Thus important commercially and industrially as Osaka and Kobe are, they are juniors to Tokio in the history of the

Osaka and Kobe exceed Yokohama in quantities of both imports and exports of rubber manufactures.

The objects and officers of the Osaka-Kobe Rubber Industry Association and of the Osaka Rubber Association, whose organization was noted in *THE INDIA RUBBER WORLD*, June 1, 1919, are as follows:

OBJECTS OF OSAKA-KOBE RUBBER ASSOCIATION.

- (a) To protect credits and transactions of the members;
- (b) To patronize trade-marks and inventions of its members;
- (c) To conduct investigations and make proposals;
- (d) To arrange arbitrations;
- (e) To advocate rewards and encouragement for faithful employees;
- (f) To exercise control over employees.

OFFICERS.

Chief manager, K. Yoshii, of the Kakuichi Rubber Co., Limited; standing manager and accountant, E. Kato, of the Settsu Rubber Co., Limited.

OBJECTS OF OSAKA RUBBER ASSOCIATION.

- (a) To dun for payment;
- (b) To suspend transactions with customers who refuse payment;
- (c) To determine measures for those who infringe contracts with the members, also losses resulting from such infringement;
- (d) To report on or to propose investigations ordered by the government;
- (e) To encourage and control employees.

OFFICERS.

President, R. Nakamura; vice-president and accountant, S. Tsuji; managers, Iguchi, Limited, S. Iida, Nishin & Co., Oishi Rubber Shop, Osawa & Co., S. Yoshikawa, T. Tanaka, Nakajima & Co., S. Muneda, Y. Miyakawa, Moriya & Co.

In April, 1919, both the Osaka Rubber Association and the Osaka-Kobe Rubber Industry Association held regular general meetings. No less than 70 members were present at the meeting of the former association at which addresses were made by the chief of Commerce and Industry Section, the deputy of the governor, the mayor of Osaka, the head of the Osaka Commercial Museum, the president of the Chamber of Commerce, the president of the Dunlop Rubber Co. (Far East), Limited, the president of the Tokio Rubber Association, and the president of Miyasaki & Co., of Tokio.

The following are the reports and matters decided at the meeting of the Osaka-Kobe Rubber Industry Association:

- (a) The business report.
- (b) Rubber manufacturers, especially tire manufacturers, should investigate concerning the total number of tires used in Osaka and Kobe and the western half of Japan.
- (c) This association to write for the members when applications concerning commerce and industry (trade-marks, designs for practical use, patents, sanction for exports, various reports, etc.), are required. When trouble takes place in respect to these applications or reports, the association to be responsible.
- (d) Purchase and sale of disposed goods and the introduction for newly invented or other novel articles, and new or old stock machines given special prices.
- (e) Rewards, encouragement and guidance for workmen shall be entrusted to the officers.
- (f) The financial report for last year, and consent for the estimate of 1919.

KAKUICHI RUBBER CO., LIMITED.

Japanese rubber industry. The amount of crude rubber imports at Osaka had been very small until 1912 as compared with that of Yokohama.

The rubber manufacturing industry of Osaka began with the making of hot-water bags by the cold cure method in 1887. Ten years later, Mr. Sailer, a British Indian, came to Japan and manufactured some rubber articles by the hot cure method, but it gave no animation to the rubber industry. The Chino-Japanese war and the Russo-Japanese war, however, stimulated the rubber industry in Tokio somewhat, and these influences also extended to Osaka and Kobe. Several rubber factories were established in these cities, with the view of manufacturing mechanical goods, rubber balls, bicycle tires, hot-water bags, etc., but they were still in an experimental state.

Owing to the revision of the customs tariff in 1911, the Dunlop Rubber Co. (Far East), Limited, and the Ingram Rubber Co., which had been importing tires and medical instruments, established factories for the purpose of making these goods. Most manufacturers of medical instruments subsequently removed to Tokio, while tire makers still remained there and have made good progress.

During the World War, Japan had to meet home demands with home-made articles owing to the decrease of imports. The scarcity of rubber manufactures in China and the South Sea created a demand for articles of Japanese manufacture, especially tires. Consequently Kobe and Osaka have prospered more and more. For instance, the total amount of imports to Japan during the seven months from January through July, 1918, amounted to \$3,507,000, of which \$2,431,000 were Kobe imports.

ASSOCIATIONS MAY UNITE.

These two associations have been considering amalgamation, and the Rubber Club was established with that very object. Apprehensive of the difference of opinion between manufacturers and tradesmen, however, some hoped to organize a legal association, consisting of manufacturers only, while others desired to establish an association of tradesmen. The Osaka-Kobe Rubber Industry Association finally applied independently to the Government in October, 1919, for the sanction of the Department of Agriculture and Commerce as the legal association of the principal rubber tradesmen. It is expected that the Osaka Rubber Association will also make a similar application at no distant date.

EUROPEAN NOTES.

OWING to a fire in the printing office in London on January 29, our esteemed contemporary, "The India Rubber Journal," is obliged to defer publication for a week, as all the manuscripts and materials were burned. A like calamity befell the "Waste Trade World," which was published at the same address, 37 and 38 Shoe Lane, London. Its special export issue must be postponed.

The British Rubber Tyre Manufacturers' Association, Limited, which controls the tyre industry in Great Britain, has made proposals for standardizing tyres that are being considered by the British Engineering Standard Association which will report on them shortly; they cover all classes of pneumatic and solid tyres and rims. The Association denies that it has adopted the sizes agreed upon by a meeting of manufacturers in Paris, who represented England, France, Italy and Belgium.

The British Dunlop Rubber Co. through its subsidiary, the Dunlop America Trust Pool, Limited, formed to establish and register Dunlop America Limited, holds 1,000,000 ordinary shares, or 25 per cent of the ordinary share capital of the American company, according to the "Financial Times" of London. It will have the right to nominate a majority of the board of directors, and any future issue of common stock will be subject to the right of the English company to secure 25 per cent of it at par. The English company will receive a fee equal to 10 per cent of the cost of erecting and equipping the American rubber mills and will also receive a royalty out of the net profits of the American company, which will be 6 per cent if the profits amount to \$250,000 a year.

PROPOSED LONDON RUBBER CLEARING HOUSE.

London dealers in rubber and rubber shares are considering the establishment of a clearing house for rubber on the lines of the terminal markets now existing for coffee and sugar. Some years ago an effort was made to include rubber among the commodities dealt in by the London Produce Clearing House, but the trade was opposed to it.

The present movement has been strengthened by a large failure due to speculation at the close of 1919, when brokers and dealers felt that greater security was needed in speculative transactions. One section of the trade now favors a clearing house, which would be convenient for handling speculation in futures, as dealings would have to be settled at short intervals and actual buyers and sellers would be brought into contact. An equally influential section, however, opposes it, because it facilitates speculation. The rubber men will meet soon and decide the question.

BELGIAN NOTES.

Bungé et Cie., Antwerp, one of the oldest houses in the rubber business, has been converted into a joint stock company, Société Anonyme Bungé, with a capital of 30,000,000 francs in 3,000 shares of 10,000 francs each. The directors are Edouard Bungé, Georges Born, Willy Friling and Clément Swolfs and the managers are Eugène Friling and Carlo Spruyt.

From Belgium comes the report that the *Brussels Compagnie de l'Hevea* and the *Antwerp Compagnie Financière des Caoutchoucs* are to amalgamate with the *Crédit Colonial et Commercial* of Antwerp, an export business with branches in London, New York, and Buenos Aires, to be capitalized at 80,000,000 francs.

ANTWERP EXHIBITIONS IN 1920.

The Olympic Games will be celebrated at Antwerp this year, under the patronage of King Albert. In connection with them, an international exhibition of motor cars will be held from May 15 to June 13, under the patronage of the Syndical Chamber of the Automobile and the Royal Automobile Clubs of Belgium. It will include seven classes, as follows: (1) Complete motor cars and chassis; (2) motor car carriage building and its elements; (3) automobile trade; (4) tires and wheels; (5) manufacturers of accessories, mechanical parts and separate pieces for motor cars; (6) accessories, mechanical parts and separate pieces for automobile trade; (7) iron and steel works and foundries relating to the automobile industry.

There will also be held at Antwerp an international exhibition of commercial and agricultural tractors, camions and motors, from June 26 to July 25, and an international exhibition of sports, sidecars, motorcycles, cycles and accessories, from August 7 to September 15. The Belgian Custom House will admit foreign exhibits free and every possible facility will be given to foreign exhibitors. All information and application forms may be obtained from the special representative in the United States, James Gustavus Whiteley, Belgian Consul, 223 West Lanvale street, Baltimore, Maryland.

JAVA'S ENGINEERING CONGRESS.

Brief mention was made in the October number of THE INDIA RUBBER WORLD of the General Engineering Congress to be held at Weltevredon, near Batavia, Java, May 8 to 15, 1920, under the patronage of the Governor-General of the Netherlands Indies. Among the papers promised that are of special interest to the rubber industry are:

"Life of Submarine Cables," by M. P. L. G. Hansen, M. E., engineer at the Post, Telegraph and Telephone Service, "Development of the Submarine Cable System," (author not announced). "The Relation between Vulcanizing Time and the Quality of Final Product in Rubber Manufacture," by Dr. O. de Vries, director of the government rubber experimental station in the Netherlands Indies. "Practical Use of Artificial Accelerators for Rubber Vulcanization," by A. Brzesowsky, chemical engineer of the Netherlands Indies rubber factory, Bandoeng.

There will be papers also by Dr. P. van Leersum, formerly director of the government rubber plantations, and L. A. van Ryn, general manager of the Netherlands Indies rubber factory.

Following this congress, an industrial fair will be held at Bandoeng, where manufacturers of tools, machinery, bicycles, motor cars, and domestic goods of all kinds, may exhibit their products.

Arrangements will be made for trips in Java, so that those attending the congress may visit important engineering works, and the places of interest of the island, like Buitenzorg, with its famous botanical gardens and museum, a rubber estate at Bandjar, and the rubber factories at Bandoeng.

The *Société Générale des Etablissements Bergougnan* whose American branch is the Bergougnan Rubber Corp., Trenton, New Jersey, has been holding the annual convention of department heads at Clermont-Ferrand, France. The company has manufacturing plants in France, Italy, Russia and the United States, plantations in Indo-China and branches in all the countries of Europe, in North, Central and South Africa, South Africa, South America, Canada, Mexico, India, the Straits Settlements, China, Japan, Australia, New Zealand and Tasmania.

The London View of the 1919 Crude Rubber Market.

SUPPLY EQUALS DEMAND.

THE DISTINGUISHING FEATURE of 1919 was the enormous supply and demand for crude rubber, especially since June. The prospects are that both will be kept up through 1920 and the succeeding years. There is an increased call not for tires alone but for all rubber articles as well. The total new supply of rubber of all kinds for 1919 was about 334,000 tons, and the stocks of plantation rubber held in addition are large. The supply of Central America and other wild rubbers has been insignificant in comparison and the low grades are very hard to sell.

THE MARKET.

The knowledge of the large supplies of plantation rubber sent prices down to a certain degree so that in June the price of standard crepe was 1s. 8d. and of ribbed smoked sheets, 1s. 7d. There were large sales, and speculative buying helped to keep the price up and the year closed December 31 with quotations of 2s. 10½d for both fine crepe and ribbed smoked sheets.

The large and steady supply of eastern plantation rubber naturally affects the demand for all grades of Brazilian rubber. The price for hard fine Pará was 2s. 7½d. at the beginning of the year and 2s. 7½d on December 31, though it rose and fell slightly throughout the year.

The prices in the last three years have been as follows:

	Fine Pará.
1919	2s. 7½d.
1918	2s. 7½d.
1917	2s. 8½d.

Jelutong is worth 1s. 2d. per pound; balata 4s. 4d. for sheets and 3s. 4d. for block, while gutta percha realizes high prices.

PLANTATION RUBBER.

PREPARATION AND PACKING.

The quality of the rubber, for the most part, was very satisfactory and creditable to the managers of the plantations. Some rubber cured by the Byrne process was much liked. There was some criticism of the packing. The close press packing which makes a case hold a heavier weight of rubber is not pleasing to the European market and is said to lead to deterioration of the rubber. Bales are also objected to. The packing should be carefully done, with the rubber laid as flat as possible, especially sheets, which should not be folded and not be packed too tight. This holds particularly for the lower grades. The cases should be strong and planed; 150 pounds is a useful size.

The rubber estates in the Far East are more than satisfied with the year's results. "The power of the British Empire and its vast resources were never more manifest and convincing." The Rubber Growers' Association and the Rubber Trade Association helped the trade greatly during the year.

ACREAGE OF PLANTATION RUBBER.

The estimate of planted areas is extremely conservative, nothing being added to the acreage for 1918. It is admitted that the plantations in India and Burma have increased; but the lands where the *Castilloa* is depended upon, Mexico, the West Indies, Central and South America have not progressed, and very slight results have been obtained so far from the attempt to obtain Ceara rubber from the *Manihot* trees in East Africa. The figures for plantation rubber therefore stand:

	1917.	1918.	1919.
Ceylon	291,000	300,000	300,000
Malaya, Malacca	289,000	800,000	800,000
Borneo	40,000	50,000	50,000
Dutch East Indies	650,000	700,000	700,000
India and Burma	50,000	55,000	55,000
Former German Colonies	10,000	8,000	8,000
Samoa, East and West Africa
Totals	1,820,000	1,913,000	1,913,000

LONDON SPOT FLUCTUATIONS OF FINE HARD PARÁ, FIRST CRÉPE AND RIBBED SMOKED SHEET DURING 1919.

	Negrohead. Scraping.	Negrohead. Island.	Caucho Ball.
1919	1s. 7d.	1s.	1s. 8d.
1918	1s. 7d.	1s.	1s. 8d.
1917	1s. 5d.	1s.	1s. 6½d.

SOUTH AND CENTRAL AMERICAN RUBBER.

The shipments of South American rubber diminished during the year. While the rubber from Brazil, Bolivia and Peru was equal in quantity to that supplied in 1918, the amount of cauchó was considerably less. The quantities of Ceara and Maniçoba were very small; Bolivia and Matto Grosso, Pernambuco and Assare, sent much less; Mollendo and Venezuela none. The Central American rubber was of slight importance. Mexico sent almost nothing, Columbia, Ecuador and Nicaragua very little.

The imports of medium Pará have fallen off; for certain grades there has been a fair demand, but soft, weak rubbers have been hard to sell. The following table shows the annual receipts and shipments at Pará during the past three fiscal years:

	1917.	1918.	1919.
Receipts of Pará	27,759	23,000	27,385
Receipts of cauchó	9,591	8,600	8,600
Shipments to Europe	14,320	6,035	11,308
Shipments to the United States	25,950	19,350	27,250

AFRICAN RUBBER.

The quantity of African rubber on the market has fallen off decidedly. Good qualities of the West Coast varieties—Niger, Gold Coast, Accra, Cameroons and Conakry—have sold well, but imports of lump have fallen off. The French Congo and Soudan rubbers, mostly from Senegal via Bordeaux and Havre, sold well. There was a fair supply from the Belgian Congo, but it was hard to sell, except a few good qualities. From the East Coast there was little rubber; very little from the *Manihot* plantations of British and German East Africa, hardly any from Abyssinia, none from Nyassaland, little from Madagascar and scarcely any red rubber from Zanzibar.

EAST INDIAN RUBBER.

The lesser Asiatic districts, Rangoon, Assam and Penang, sent small quantities to England; Borneo, very little wild rubber but more *Hevea*. The supply of jelutong was small. That of balata was less than in previous years though the demand was strong.

Good qualities of gutta percha brought high prices. Sumatra and Java produced much less Rambong rubber and much of the large export of Hevea rubber is not counted in the British figures.

BRITISH STOCKS.

British stocks on December 31 were 24,986 tons of which 770 tons were Para or caucho and 24,216 tons were plantation rubber. British imports and deliveries of all sorts for the year were 85,816 tons imports and 76,974 tons deliveries; of these 7,823 tons imported and 7,387 tons delivered were Para and caucho.

THE WORLD'S PRODUCTION AND CONSUMPTION.

The world's production of crude rubber of all kinds for the year 1919 is estimated by authorities at about 334,000 tons. If 30,000 tons is added for stocks on hand and rubber afloat on January 1, 1920, it will give 384,000 tons as the world's supply, the greatest amount on record. The demand during 1919 was nearly as great.

ESTIMATED WORLD'S SUPPLY, 1919.

	tons
Plantations, Malaya, Ceylon, India and Dutch East Indies	297,000
Brazil and Amazonia	35,000
Martin Gossio, Maracaba, Assaré	500
Central American	1,000
West Africa	5,000
East Africa	500
Total	334,000
At risk and afloat January 1, 1920	50,000
Total	384,000

The consumption of crude rubber of all varieties and grades, but excluding reclaimed rubber, is estimated as follows for 1919:

	1917.	1918.	1919.
England	26,000	24,000	30,000
Germany, Austria	1,000	1,000	2,000
France	10,000	10,000	20,000
Russia	7,000	2,000	1,500
Italy, Spain, Scandinavia	5,500	5,000	7,000
Japan and Australia	5,000	5,000	7,500
United States and Canada	155,000	187,000	230,000
Totals	209,500	210,000	298,000

This has been mostly consumed. Besides, there is the stock on hand in England, the East and America, say 70,000 tons and 16,000 tons afloat. This is admittedly an underestimate. Leaving out Russia and the Central Powers, where estimates are mere guesswork, the amount consumed by every country in Europe has increased, while the increase for the United States in a single year was about equal to the total normal consumption of the rest of the world.

Much of the information contained in the above review was supplied by J. Fievis & Co., London.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official report from Kuala Lumpur gives the export of rubber from the Federated Malay States in the month of December as 10,340 tons, compared with 9,848 tons in November and 7,085 tons in the corresponding month of 1918. The total for the year 1919 is, therefore, 108,393 tons, against 78,225 tons in 1918, and 79,831 tons in 1917. A better idea of the enormous strides made by the rubber industry in the Federated Malay States—leading producer of plantation rubber—can be obtained by a glance at the statistics a few years ago. So recently as 1909 the total export for the year amounted to only 2,641 tons. In 1912 it had risen to 15,506 tons, and in 1914 it amounted to 30,667 tons.

Details are appended of the monthly exports for the past three years:

	1917.	1918.	1919.
January	5,995	7,588	7,163
February	7,250	6,820	10,809
March	7,088	7,700	10,679
April	8,955	7,428	7,664
May	7,179	5,851	7,308
June	6,009	5,161	7,094
July	5,798	6,706	8,640
August	6,487	5,291	10,626
September	7,87	6,588	9,841
October	7,075	5,901	8,381
November	6,186	7,097	9,848
December	7,724	7,085	10,340

Totals 79,831 78,225 108,393

STRAITS SETTLEMENTS RUBBER EXPORTS.

The exports of plantation rubber from Straits Settlements ports in the month of December last (according to an official report from Singapore) amounted to 14,244 tons, compared with 13,426 tons in November and 4,839 tons in the corresponding month of 1918. Transshipments amounted to 1,855 tons in the month of December. For the past year, the total exports of rubber amounted to 145,960 tons as against 63,376 tons in 1918 and 73,092 tons in 1917. Part of last year's total was made up of rubber that had accumulated at Eastern ports owing to the lack of shipping; but there was undoubtedly a larger production of rubber on the Malayan estates, following upon the abolition of the voluntary restriction of output agreed upon by the principal producing companies. The above figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the non-Federated Malay States, as well as rubber actually produced in the Colony, but do not include rubber exports from the Federated Malay States. Transshipments last year amounted to 17,903 tons.

Appended are details of the monthly exports for the past three years:

	1917.	1918.	1919.
January	3,562	4,302	14,404
February	6,495	2,334	15,661
March	5,279	2,858	20,088
April	6,103	6,584	10,848
May	6,282	13,587	15,845
June	7,775	6,515	5,059
July	7,351	1,978	7,818
August	3,786	1,249	8,933
September	5,279	1,060	10,476
October	4,702	3,260	8,338
November	5,555	2,661	13,426
December	6,503	4,839	14,244
Totals	73,092	63,376	145,960

EXPORTS FROM PENANG FOR THE YEAR 1919.

To Great Britain	232,440
Europe	147,987
United States	380,427
Total	760,854

One picul equals 133½ pounds.

LOWEST AND HIGHEST NEW YORK SPOT RUBBER PRICES, 1913-1919.

Review of the Crude Rubber Market.

NEW YORK.

THE CRUDE RUBBER MARKET remained steady through February, declining gradually to the close. There was little buying by manufacturers, but good trading among the dealers. Plantation rubber continues to command higher prices than the Brazilian. The markets in London and Singapore are dull, all trading being affected by the uncertainty in exchange, especially the dealing in futures.

Prices for plantation and South American rubber at the beginning and toward the end of the month are shown in the following quotations:

PLANTATIONS. February 2, first latex crepe, spot 51 cents; futures, April-June, 52 cents; July-December, 53 cents; February 25, spot, 46-47 cents; futures, April-June 47½, July-December 49½ cents.

February 2, ribbed smoked sheets, spot 51 cents; futures, April-June, 52 cents; July-December, 53 cents; February 25, spot, 46½ cents; futures, April-June 47, July-December 49-49½ cents.

February 2, No. 1 amber crepe, spot, 52 cents; February 25, 48 cents; futures, July-December 49 cents.

February 2, clean thin brown crepe, spot, 48½ cents; futures, 49 cents; February 25, spot, 45 cents; futures, July-December 47½-48 cents.

February 2, No. 1 roll brown crepe, spot and futures, 42 cents; February 25, spot, 41 cents; futures, July-December 40-41 cents.

SOUTH AMERICAN PARÁS AND CAUCHO. February 2, spot prices; upriver fine 45 cents, islands fine 44 cents, upriver coarse 34 cents, islands coarse 23 cents, Cametá coarse 23 cents, cacho ball 34 cents. February 25, upriver fine 42½ cents, islands fine 42 cents, upriver coarse 31½ cents, islands coarse 20½ cents, Cametá coarse 21½ cents, cacho ball 32 cents.

NEW YORK QUOTATIONS.

Following are the New York spot quotations, for one year ago, one month ago and on February 25, the current date:

RECLAIMED RUBBER.

The market for reclaimed rubber during February has been active in all the standard grades. Production is practically sold up into the spring months by the leading reclaimers who are not seeking contracts from users at the present time. On the other hand, large consumers are holding back on the present market beyond their commitments for May in anticipation of a hoped for change of prices within a few weeks.

The prices on all standard grades remain the same as the quotations for January.

NEW YORK QUOTATIONS.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"During February there has been a fair demand for paper, mostly from out-of-town banks, and early in the month rates were about 6½ per cent for the best rubber names, but at the end of the month buyers wanted 6½ per cent and 7 per cent on almost everything. It looks as though rates will rule very firm for some time yet."

SINGAPORE RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [January 8, 1920]: At the usual weekly auctions held yesterday and today there was a good demand for all grades, with the exception of off qualities ribbed smoked sheet. Fine pale crepe sold at up to \$1.13 (one lot sold for \$1.13 and two lots for \$1.12½) and 2 cents better than last week. Ribbed smoked sheet fetched \$1.11½ (three lots sold at \$1.12) or the same as last auction. Last week's good demand for the lower grades of crepe continued, and these show advances of from 3 to 3½ cents.

Out of 871 tons cataloged 616 tons were offered and 348 tons sold, many lots of off quality ribbed smoked sheet being withdrawn.

The following is the course of values:

	In Singapore, per Pound ¹	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked.....	108c @ 111½c	2/ 8¼ @ 2/ 9¼
Sheet, good ribbed smoked.....	98 @ 107½	2/ 6 @ 2/ 8½
Crepe, fine pale.....	108½ @ 112	2/ 9¼ @ 2/ 10¼
Crepe, good pale.....	101 @ 107½	2/ 7½ @ 2/ 9½
Crepe, good brown.....	95½ @ 103	2/ 5¼ @ 2/ 7½
Crepe, dark brown.....	88 @ 96	2/ 3¼ @ 2/ 5¼
Crepe, dark brown.....	80 @ 90	2/ 1¼ @ 2/ 4¼
Crepe, dark brown.....	74½ @ 84½	1/ 11¼ @ 2/ 2¾

¹Quoted in Straits Settlements currency \$1 = \$0.567 United States currency.

BATAVIA RUBBER MARKET.

BIERMAN, MARSMAN & CO., Batavia report [November 16 to December 15, 1919]:

At the opening of the market, the tone was very weak, and during the first week of December did not improve; only a few transactions were made, at prices ranging between 1.31-1.42 guilders for fine pale crepe and prime smoked sheets.

The market closed with more demand and higher quotations, 1.44 guilders (57.6 cents) for prime smoked sheets and fine pale crepe, while some mixed lots consisting of off crepe and off sheets were sold at 1.27 guilders (58.8 cents).

AMSTERDAM MARKET REPORT.

TOOSTEN & JANSSEN, Amsterdam, report [January 30, 1920]:

During the present week the market was very firm, a good turn-over being done with rising prices.

At the beginning of the week a fair business was done for deliveries during the present year, mostly for the later months, at f. 1.40-1.41½, but later on inquiry was mostly confined to spot parcels, for which in consequence of coverings for January delivery, very good prices were obtained.

On Monday business in standard crepe was done at f. 1.42, on Tuesday in the inscription f. 1.45-f. 1.47½ was paid, and later in the week even f. 1.50.

During the last days only a little was being offered, but on the other hand the most pressing needs of the moment seem to have been satisfied.

On February 10 277,200 kgs. are being offered in the next inscription, of which about 58,000 kgs. are standard smoked sheets, 112,000 kgs. standard crepe, and about 100,000 kgs. lower qualities.

ANTWERP RUBBER MARKET.

CRISER & CO., Antwerp, report [January 30, 1920]:

There have been no serious fluctuations of late, the market is sound and was firm at the end of the month. Sales are of little importance, as dealers here are waiting for the auction on February 19. The stock on hand at the port of Antwerp was about 886 tons. The closing prices for futures on January 20 were: 14.05 francs for every month from February to October, 14.00 francs November, 13.85 francs December. The tone of the market is firm.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THERE has been a steady demand for shoe and tire scrap from the reclaimers who are operating at capacity in most standard grades.

The price of shoes is somewhat easier than last month. The unusually heavy snow of the past month has depleted stocks of rubber footwear and this enormous consumption of new goods will have a marked effect in increasing the spring collections. The spring collection of tires is due in two months and will be of larger than usual proportions.

The price of crude is but slightly affecting that of scrap.

The most important factor in the scrap rubber market has been the difficulty of making shipments. The heavy weather has em-

bargoed practically all consuming points. Dealers thus being unable to move their stocks freely either inward or outward. This situation has resulted in lower price offerings by the dealers.

Figures compiled by the National Automobile Chamber of Commerce indicate that the scrap tires produced in 1920 will total a net rubber content of 96,000 tons, scrap tubes for 1920 will net 20,000 tons, a total of 116,000 tons rubber scrap resulting from 1920 expansion in the automobile industry. Some dealers look with concern upon this output while others optimistically consider it affords an opportunity for them to do a bigger business than ever, possibly on a new scale of prices.

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

AMERICAN COTTON. Though the variations in prices amounted to 255 points, the market for cotton remained extraordinarily dull throughout February, "no sales" being recorded day after day for three weeks. On February 2, the spot price for middling uplands cotton was 39.50 cents; it declined day by day to 37.35 cents, rose slightly and hung around 38 cents for a week, then rose slowly to 39.35 cents on February 24 and 40.10 cents on February 25.

EGYPTIAN COTTON. The market for Egyptian cotton has been rather erratic, with violent fluctuations, but this has not seriously affected the actual sales. Conditions are much as they were last month, though prices have gone up somewhat. High grade Sakel is worth \$1.50 a pound and upper Egypt 8 or 10 cents a pound less.

ARIZONA COTTON. This is selling now at \$1.00 a pound for medium grades and little of it is to be had. The number of bales on hand is less than 3,000. The quality of the Arizona cotton makes it more desirable for the purposes of American manufacturers than the Egyptian. It has been figured that the

world's supply of long staple cotton will not fill the demands of the tire manufacturers.

SEA ISLAND COTTON. So little of this is left that it may as well be left out of account; it does not amount to more than 3,000 bales. Some has been sold recently at \$1.00 a pound for selected average extra choice. Some mills have given up Sea Island entirely and turned to Egyptian.

DUCKS AND DRILLS. The demand has been active and manufacturers have had nothing to offer for prompt delivery.

RAINCOAT CLOTH. The advanced prices in the raincoat trade have been maintained during the month. There has been little or no change in the market and there is absolutely no demand for the goods at the prices asked.

SHEETING. While buying during the past two weeks has slackened up very materially, prices have not weakened to any extent. Goods from mills are still hard to obtain.

TIRE FABRICS. The conditions existing since last fall continue and are not likely to change. The product of the mills has been sold out for the whole of 1920. Only futures are offered at absurdly high prices. Some tire manufacturing companies are selling the tire fabrics they have bought at a profit, instead of making tires themselves.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE GENERAL CONDITION of short supply continues unrelieved in most lines as was reported for January. Labor, fuel and transportation are the controlling factors in this situation which will continue to be readjusted slowly to the needs of industry generally.

ANILINE OIL. There is very little spot being offered; price 32 to 34 cents per pound.

BARYTES. There is considerable uncertainty in the production situation as regards labor, fuel, etc., which is reflected in limited nearby offerings at \$23 to \$25 per ton.

BENZOL. The pure grade is quoted at 27 cents and 90 per cent at 23 cents per pound.

DRY COLORS. Prices generally have been firm and latterly in the month were advanced to new levels.

LITHARGE. Production is keeping pace with demand. Prices are very firm with labor cost rising.

LITHOPONE. Output sold far ahead. There is very little spot stock and none for contracts. The price is 7½ to 7½ cents per pound.

SUBLIMED LEAD. The high price of pig lead has resulted in very firm prices for lead products. The demand for sublimed lead is beyond production capacity.

SULPHUR. There is steady demand at firm prices which remain unchanged the past month.

WHITING. There has been a persistent shortage of chalk importation curtailing output and supporting high firm prices for whiting.

ZINC OXIDE. The demand surpasses all records and production costs are mounting. The various grades are sold well ahead. The item of coopeage is a strong factor in the present high prices.

NEW YORK QUOTATIONS.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**PENNY WISDOM.**

THE AMERICAN RUBBER INDUSTRY, with its vastly increasing interests, may well view with grave concern the proposal in Congress to economize through a 28 per cent reduction in the appropriation for the upkeep of the Bureau of Foreign and Domestic Commerce and the Bureau of Standards. Very valuable has been the service of the former bureau in aiding in the development of this country's manufacturing industries and in extending their markets at home and abroad, not only by gathering, with the aid of trained experts, a great amount of helpful information, but also in actively directing through commercial attachés in other lands the speedy and profitable distribution of American products. So, too, have the functions of the other bureau been of great aid in establishing standards for scientific investigations, engineering, manufacturing, interstate and international trade, and educational institutions.

Reduced resources for those agencies would mean curtailment of the scope and volume of their work, impaired usefulness of the bureaus, and the consequent handicap that American manufacturers must suffer in trying to cope with powerful rivals overseas for a fair share of the world's post-war trade.

American business men know far better than politicians how quickly war-worn countries are being regenerated and how many obstacles this country must surmount if the United States is to hold its own in foreign commerce under conditions profoundly changed by the Great Conflict. They know only too well that if our industries are to flourish we must develop foreign trade as well as meet the needs of our home market. In other words, domestic stability and national growth are vitally dependent upon steady, increasing international commerce.

Congress cannot shirk its plain duty to fairly aid American enterprise; and it is incumbent not only upon rubber manufacturers, but upon those in all other lines to protest against such false economy and to demand of the Government not only for themselves but for the American people the aid and consideration that other governments only too gladly offer as a reward for their industry and to enhance their prosperity.

CLEAN RUBBER AT THE SOURCE.

CLEANING RUBBER at the source of production was a project that once attracted considerable attention and was also successfully and profitably accomplished, although in a small way. When only wild rubber was available some process was needed, for washed and dried rubber in the manufactory showed an average loss of 40 per cent for African, 30 per cent for Centrals, and 20 per cent for Pará's. The "loss" was chiefly dirt and water and presumably could just as well be removed before shipment as after.

It, therefore, was natural that small cleansing plants should be erected on the African coast; in Central and South America. They were never very successful nor generally patronized. The main reason was, that there was always the feeling that rubber should be gathered in a cleanly manner and not need further cleansing, and furthermore, a multiplicity of grades gave greater profit to those alert in substitution.

With the advent of plantation rubber the problem solved itself. Almost at once clean dry rubber ready for "breaking down" was on the market in great quantities. Scrap and earth rubber were cleaned at the plantation factories.

To show what an advance this is, one has only to imagine plantation rubber as showing 20 per cent shrinkage. If this were the case American rubber manufacturers would pay freight upon 30,000 tons or more of water and dirt plus the costs of extraction.

Other suggestions for doing some of the initial work at the source are massing and compounding. The former is not viewed with favor as the plantation identity is lost and massed rubber is likely to perish in transit. As for compounding that has been done experimentally, both by adding sulphur and fillers to latex and in the usual manner. In neither case was it found practical.

So far, therefore, cleansing at the source is the only rubber process that has been transplanted from the factory to the forest.

A CENSUS FOR SAFETY.

THIS BEING CENSUS YEAR, it is fitting that the rubber trade, thinking along with the Government, should have a census of its own. Thus, the plan of the Rubber Section of the National Safety Council, to secure a census of accidents in the rubber industry is not only timely but of the greatest importance. The facts thus gathered, classified and analyzed by a committee made up of practical men from the big rubber plants, will result in prompt remedies, in new safety appliances, and in a marked lessening of accidents.

Much has been done in the past to make rubber factories safe to the worker. But regrettable accidents still occur. It is so in every great industry. In our United States 80,000 fatal accidents occur in factory and home annually. Of these the rubber trade has its share. And it is to this safety census that we look with confidence for a good measure of relief.

IT KILLED THE PAPER SOLE.

THAT IS WHAT THE RUBBER LEATHER SOLE did for mankind. When leather was the only substance that shod foot bottoms, anything that looked like it was used. Sole leather veneers backed up with rags, strawboard—any cheap filler that could be obtained was used, and the novice bought and repented. But with the advent of the rubber leather sole, the producers of leather and near-leather woke up. Their business was jeopardized. They had forfeited the confidence of the great shoe-wearing public, and the paper sole disappeared. Not only that, but the very best that the leather man could produce was put into soles. Furthermore, thousands of dollars were put into frantic advertising of certain best makes. Thus rubber did a great service, and best of all the rubber sole won for itself a place, from which no policy, no advertising appropriation can evict it.

KANSAS STRIKES AT GENERAL STRIKES.

THE STATE COURT OF INDUSTRIAL RELATIONS established in Kansas is urged upon other states by Governor Allen, who says:

"Any minority which has secured control of a product upon which human life depends, and which undertakes, for the purpose of affecting wages or profits, to withhold that product from the public until the public shall freeze or starve, has, in effect, superseded government and has arrogated to itself the control of the destinies of human life which government alone may have the power to safeguard."

This is plain talk and foreshadows the day when no clique, either of labor or capital, will have it in its power to paralyze industry.

In this connection, the report of the Second Industrial Conference which is now in the hands of President Wilson is of great interest. This takes a firm stand against "collective bargaining," holding that individual plants should settle their own labor problems.

Of further interest and of much significance is the action of certain large cities that have declared themselves as wholly "open shop" communities.

All of the above point to a cessation of labor struggles and fewer strikes.

TIRE PRODUCTION FOR 1920.

PROPHETS, of course, are as fallible as those who do not venture opinions. Furthermore, the major part of prophecies fail. There are two lines of forecast however, that have gone far beyond the wildest hazards; the production of crude rubber and the annual increase in tire production. As to the latter, estimates vary rather widely. Based upon the figures of a well-known automobile man, one of the directors of the Motor and Accessory Manufacturers' Association, 1920 will see 51,500,000 tires produced. A statistician of the "Boston News Bureau," basing his figures upon facts furnished by the Firestone Tire & Rubber Co., predicts 72,000,000 tires. This, however, may not be possible because of scarcity of fabrics. Experts state that the present spindle capacity is 150,000,000 pounds of fabric, enough for 40,000,000 tires, which would suggest more spindles or use of some other fiber in tire building.

LUDWIG C. A. K. MARTENS, RUSSIAN SOVIET REPRESENTATIVE, recently published a long list of American firms who were "anxious to do business" through him with Russia. Among the names were certain large rubber companies. A protest was promptly filed with the Senate Foreign Relations Committee by whom an examination is being conducted and Martens conceded that "they (the companies in question) have been solicited to sell goods and have not sought orders."

It may be of interest in this connection to state that a very cleverly written article from Soviet headquarters was sent to THE INDIA RUBBER WORLD months ago, describing Russian markets and the millions to be spent in America. It was not published.

FORMER PREMIER CLEMENCEAU of France announces that he is tired of politics and is going to the deserts of Africa to "seek a fortune in rubber." It seems that one of his compatriots has discovered a new process of refining the gum of the *Eucalyptus*, and that is to be exploited. Frankly, we wish he wouldn't. He is too good and too great to be wasted upon a hopeless quest. If only he would take up a big tract of land and plant cotton, that would help the world, the rubber trade, and himself. But to-day wild rubber from any minor producer does not spell success.

Is Hard Rubber Wood a Dream?

LLOYD W. PARSONS, a regular contributor to "The Saturday Evening Post," who furnishes much interesting and informing matter for that great weekly, thus speaks of rubber:

"Henry C. Pearson, of THE INDIA RUBBER WORLD, sees the day when you can take the milk of the

Mr. Parsons characterizes hard rubber wood as a dream, and does it most courteously. He classes it with that type of dream known in the dictionary as "an idle fancy." If, however, it should transpire that certain American factories were marketing products made of hard rubber wood, taking the place of

AN ARTISTIC RUBBER WOOD CABINET.

rubber tree, convert it into an elastic resin, then bake this resin with sulphur and turn the product into rosewood, walnut, mahogany and ebony of the finest sort.' He says: 'Any rare wood can thus be simulated. It will not warp or check, and it will not absorb moisture. Its sawdust and chips can be molded again into the first shape. Even the boards

of tropical woods, the statement of the Editor at once is transformed from fancy to fact. Such is the case.

BLACK OAK RUBBER WOOD.

Before starting to discuss present products it is well to recall that a few years ago a French artist built some very beautiful

RUBBER WOOD CLOSET SEAT, MAHOGANY.
A AND B INTERIOR LAMINATION.

once out of use can be ground up and used again and again.

"Whether such dreams materialize or not, rubber is sure to become one of the mightiest essentials in the life of civilized man."

RUBBER WOOD CLOSET SEAT, FRONY.

cabinets and bookcases not from wood but from hard rubber veneer backed with papier-mâché. The effects secured were equal in every way to the best rosewood, mahogany and black oak. They were free from all of the faults that wood possesses. Heat or cold, moisture or dryness were absolutely without effect upon the product. No coating or varnish was used in the surface finish, as none was needed. The cabinet shown in the

illustration was pronounced by wood connoisseurs to be a wonderful effect in black oak. A worn out cabinet of this sort could be broken up, the cellulose backing dissolved by the familiar process of acid rubber reclaiming and the hard rubber ground

REGULATION RUBBER WOOD BOWLING BALL. PLAIN BLACK.

and used in the production of new goods. At last reports, panels from this cabinet were reposing in a bonded warehouse in New York City.

HARD RUBBER LIGNUM-VITAE.

There is in the West Indies a tree, the *Guaiacum*, from the heart of which comes a dark-colored, heavy, cross-grained wood known as lignum-vitae. The wood is scarce and costly as it is in great demand for rollers, pestles, pulley blocks, and particularly for bowling balls. No other wood is comparable with it for such use. No other substance or combination of substances anywhere near equalled it in weight, solidity, polish and effectiveness until a hard rubber substitute was tried. Then it was not only equalled but outdone. To-day a bowling ball made of

REGULATION RUBBER WOOD BOWLING BALL, MOTTLED LIKE LIGNUM-VITAE.

hard rubber compound designed to imitate lignum-vitae reigns supreme. For weight, color, and polish it is everything that could be desired. And as for grain, Nature is beaten to a finish. Hard rubber lignum-vitae outwears the West Indian product. It contains no knots nor imperfections. And after years of service the worn out ball can be ground up into hard rubber dust and worked into sheet, rod or a thousand other useful hard rubber products.

HARD RUBBER EBONY AND MAHOGANY.

For interior finish hard rubber wood already has a firm foothold. The product is not called rubber lumber or rubber wood, however, but Whalebonite. Responding to a call for rubber from the medical fraternity, a closet seat made of hard rubber wood, imitating in color either ebony or mahogany, has been created. From the first it was a great success. It is so far superior to the best wooden seat that scores of hospitals, clubs, hotels and office buildings have adopted it. Unlike wood, it has no joints, will not split, crack or warp, is light in weight, and is absolutely unaffected by moisture, or by acid or acid fumes.

Not fancies, these, but facts—facts that forecast a great future for rubber wood.

THE POSITION OF PLANTATION RUBBER IN 1919.

AN INTERESTING SURVEY of the present condition of the plantation rubber market is made by E. L. Killick, the rubber expert of the London "Financier" in that periodical's "Rubber Share Handbook" for 1919. His judgment is as follows:

"A scrutiny of the figures relating to the production and consumption of rubber indicates that the world's stocks of all kinds at the present time are not less than 100,000 tons, and probably more. As far as can be ascertained at the moment, the total production in 1919 was about 350,000 tons, of which some 330,000 tons appear to have gone into consumption. The year consequently begins with but a comparatively small addition to the surplus on hand twelve months before. In 1920 an addition of some 50,000 tons to the world's output is expected, so that the total quantity of rubber of all kinds available this year, including stocks brought forward, seems likely to be something over 500,000 tons."

These figures are not so formidable as they seem to be at first sight, he goes on to say, because of the increased demand due to the development of motor traction. They leave a margin of three or four months' supply, as compared with the single month of a few years ago, but this is largely nullified by the congestion at the docks and the delays in distributing cargoes.

While there is no shortage in sight there is no fear of a glut of rubber; the production will hardly increase at the rate that the consumption will. An enormous development has taken place in the use of solid tires for commercial motors and the railroad strikes have shown the advantages of both these and the passenger motor cars. It is conceivable that there may be a shortage of rubber in a few years, with higher prices in consequence and a larger use of inferior grades and reclaimed material.

Mr. Killick explains that investment in rubber plantation shares is attractive not only on account of the huge returns obtained but also because the investment is steadily appreciating as the value of the plantation and its output increase yearly with the growth of the trees planted. His estimate of the finances of an acre of land in the Far East is very interesting.

"We may take it that an acre of jungle can be cleared, planted and brought to bearing at an approximate cost of £50. In Malaya, Sumatra and Borneo the tree should be of tappable girth at the end of the fifth year, and by the end of the seventh year the annual crop of rubber may be as much as 400 pounds per acre, given good average soil, suitable climatic conditions and capable management."

The question of producing costs is a little uncertain now, one disconcerting factor being the rise in the rupee and one trouble with exchange. In the past rubber has been marketed at an average cost of 10d. a pound, but to-day it costs at least 1s. and prices are advancing so that it is safer to take 1s. 6d. as the cost of a pound of rubber ready to ship. The mean price obtained for it in the last five years has been 2s. 6d. a pound, and when Mr. Killick wrote, it was 2s. 10d. It is safe to call it 2s. 6d.; the profit on a pound would therefore be 1s. and on 400 pounds, an acre's crop, £20. That is the equivalent of 40 per cent on the capital investment of £50 to bring the acre into bearing.

The Effect of Location on Prosperity of American Rubber Industry.

By L. W. Allyn-Schmidt, Consulting Economist.

THE VALUE of all the rubber goods manufactured in the City of Akron, Ohio, during the year 1914 amounted to \$93,980,000, representing 41.4 per cent of the total output of rubber goods during that year valued at \$300,994,000. No other city of the United States, or in the whole world, can show such an enormous production of rubber goods. The nearest approach to it in the United States is the City of Trenton, New Jersey, that produced rubber goods valued at \$8,000,000 in 1914. It is, therefore, no wonder that Akron gives Ohio a superior lead in the manufacture of rubber products and makes it the leader among the states of the Union. During the year in question the value of rubber goods manufactured in that state amounted to \$109,659,000. New Jersey with Trenton came second with a total production value of \$25,458,000. Massachusetts, having Boston as its main center of rubber production, followed with a production valued at \$23,000,000. Pennsylvania with \$12,000,000, while Connecticut and New York each reported \$10,000,000 approximately.

Both Akron and Trenton have kept their superiority as producers of rubber goods practically since rubber manufacturing started in the United States, but their influence upon American rubber production was considerably less during the preceding census when only 38.4 per cent of all the American rubber goods were manufactured in Akron, while Trenton did slightly better with 3.9 per cent to its share. As to rubber boots, Boston takes the lead, holding practically the whole of the production of Massachusetts, which also leads as a state

in the production of rubber footwear, with a total production valued at \$13,000,000 before the war. New Jersey, as in the past, still claims to be the leader as a producer of rubber belting, the industry giving to the city of Trenton its great importance as a rubber manufacturing center.

Such concentration of one industry might be easily understood in the case of industries which are bound to their location by reason of their markets or the supply of raw materials. It appears, therefore, rather surprising that the rubber industry, which is not tethered by any of these considerations, has selected these localities for its home in the United States. Considering the enormous economic importance of the United States rubber industry one can say with some degree of correctness that the condition existing here is not repeated in any other country. Nowhere in the world is the rubber industry as concentrated as to include practically half of its total production inside the limits of one city which does not even claim to be of

exceptional size. Neither is there anything in the present situation that could have forced the United States rubber industry to develop the plan of its original growth upon so narrow a basis as has been the case.

RUBBER INDUSTRY ECONOMICALLY INDEPENDENT.

Speaking from the viewpoint of national economy the rubber industry is an independent industrial unit. It is one of the master industries of the country and not supplementary to others. There is, therefore, no reason to locate in districts where it might be situated in easy proximity to other industries requiring its products. Such considerations may have influenced the location of the drop-forging industry, for instance, or the shoe findings

industry, both industries that look for their market to related industries for which they prepare the raw materials. But the rubber industry has an independent market. While it is supplementary to certain industries which employ its products for the purpose of completing their own, there is no need for the rubber industry to rely upon the custom of these industries. It has its own markets and marketable products that are increasing in number and range of consumption from year to year. It is, therefore, tied less to location than many other industries, and its selection of locality is not determined by this one factor which narrows down considerably the choice of a home of many other industrial enterprises.

The explanation of the present situation in the geographical location of the United States rubber industry is, undoubtedly, historical development. The industry, having originally found a home in certain cities of the United States, continued to grow within these limits as the result of a natural division and subdivision of formerly united forces and, having once provided the ground for development, remained there by the simple force of habit. The outcome is analogous to that experienced in many other industries similarly placed, but just as conservative in the selection of their locations.

Having once acquired the habit, the industry has been slow to mend its ways. There was, no doubt, a certain advantage in the beginning in locating as much as possible in one city or district. The labor of other factories could be drawn upon. The men who formed the new enterprises were themselves at home in the district and had grown up in it. Finally, when the industrial development of the rubber industry started in earnest there was the main consideration of participating in the pros-

THE COMPARATIVE GROWTH OF THE UNITED STATES RUBBER INDUSTRY IN LOCALIZED DISTRICTS.

perity of the existing enterprises by starting operation from the same basis that had proved successful in their instance. But it is questionable whether the limits of this earlier development of the industry have not been reached, whether in the meanwhile in fact it has not outgrown the surroundings of its childhood.

This is a point which deserves the most serious consideration of the men in charge of the future of the rubber industry.

ECONOMIC CAPACITY OF ANY ONE CITY IS LIMITED.

The economic possibilities of any given neighborhood and its capacity for sustaining an industry are by no means inexhaustible. If this fact had not been already known to economists our most recent war history would have brought new proof. Under the pressure of the unprecedented war demand many industries were forced to expand, and finding it convenient for their purpose carried through the process of expansion upon the apparently fertile soil of their own location. New factories were erected in the immediate neighborhood of the mother enterprises and labor was attracted to the localities by the artificial means of offering high wages and similar inducements. The so-called war prosperity of the nation has not diminished since this happened. In fact, always excepting those industries that were connected immediately with the war, there has been a continuous growth in the economic activities of the country. Nevertheless, there is evidence that many of the works erected under the spur of the war were not destined to prosper under normal conditions. They find it difficult to hold their full complement of labor, they complain about the lack of fuel and power, and the distribution of their products is not proceeding as evenly as might be desired.

The cause is obvious. The existence of these new enterprises, planted upon the already heavily charged soil of one district, is menaced by the increasing economic exhaustion of that soil. A railway line can transport only a certain quantity of goods from and to one location. Charge it with a larger load and it must break down under its own real or imaginary prosperity. A community can house only a given number of inhabitants, and its facilities to provide for more are the limit of its progress toward increased population. It must take years to change these fundamental factors affecting the economic energies of a district and the industrial progress of the nation cannot wait until the process has been completed. Hence the failure of the industrial plants that come in contact with conditions as those described.

To apply this rule to the rubber industry there is much in the present location of that industry that calls for caution. The rubber industry in certain of its branches is a lavish employer of labor. It needs great quantities of water in others, and spacious factories are essential to the successful conduct of its affairs. This is not written to discourage the location of rubber factories in certain parts of this country, but to point out the danger of overloading the facilities of certain districts to the detriment of the industry as a whole.

EXCESSIVE CENTRALIZATION OF INDUSTRIES CAUSES INCREASE OF OPERATION EXPENSE.

It is only too obvious that industries working under artificially inflated conditions affecting their most essential manufacturing operations must work more expensively than others. Let three water-mills compete for the water power of one stream, and the system for carrying the water to the mill wheels will be more expensive to each mill than if only one mill operated on the same stream. The cost of mill operations will increase by the simple fact that the upkeep of the installations is more expensive. The same applies to a number of rubber factories competing for water, labor and the shipment of raw materials and manufactures inside the limits of one district or one city. Increased demand for these facilities will tend to increase their cost and while such a tendency may not show on the surface it is bound to influence each factory in one manner or another.

The need of having a large labor surplus, so essential to the operation of the rubber industry, causes a rather serious situation. To house this surplus, to make it comfortable and content with working conditions, is more difficult in a neighborhood dangerously overcharged than where living conditions are easy, where housing is plenty, and where labor may stay on comfortably even if temporarily unemployed.

If conditions are different, if they are in fact as witnessed just now in several of our great rubber manufacturing centers, labor will not stay. It will keep floating from city to city in search of better conditions, and it will certainly leave those locations where it finds it most difficult to remain. The result in each instance is an ever-recurring shortage of labor which makes work easy for the professional agitator. It degrades labor to the standard of a commodity shipped from city to city and prevents the growth of a healthy labor market based upon a labor force that owns its own home and commands a banking account that may be drawn upon during the short periods of unemployment which will happen even in the best organized industry. Incidentally it will give to the industry a labor force that stays on the job and does not leave for reasons entirely unconnected with conditions in the factory.

It seems from this that the present policy of centralization followed by the rubber industry is faulty from practically all reasons that apply to the selection of industrial location. It is not justified by the supply of raw materials and the markets of distribution. It has no support from the existence of special facilities for the operation of its enterprises because these conditions are not exceptional and are found practically in every city of importance in the United States. It is not advisable out of the special national consideration that may necessitate the location of certain valuable industries in regions where their presence is needed as a matter of economic policy.

While centralization is not wrong in itself and has its uses, a time may come where it can be dispensed with, where in fact a change in policy is advisable in the interest of the future growth of the industry. This time seems to have come for the American rubber industry.

The truth of this contention has been fully realized by many leading rubber manufacturers, and during the war attempts were made to place new rubber plants outside the more common range of location of that industry. No revolutionary steps have been undertaken, but the geographical location of the field of production has been broadened, with the result that many new cities have been entered by the rubber industry. The statistical records that are available for the study of such a development are still incomplete, and the following statements, therefore, are based upon general impression rather than upon statistical facts. The student of the more recent development in the United States rubber industry, however, will consent that this development while it has carried the industry over its former geographical limits, nevertheless has followed the lines of a distinct regional evolution. It has left the municipal centers and spread over states.

EFFECT OF RELOCATION.

The attempted relocation of the rubber industry has principally affected all the states that were originally important as rubber manufacturing centers, but it seems to have affected them not always in the same manner. In Ohio, for instance, the rubber industry has seen many additions. A close investigation of the situation, however, shows that the growth in the importance of that state as a rubber goods producer is still the result of increasing centralization, instead of the more desired decentralization of location. Akron still holds the overwhelming producing power of that state, and what new rubber works have been formed are located mostly in this city or in its immediate neighborhood. The gain of the rubber industry in that region, therefore, may not be an entire blessing, although it only falls in with the general tendency of the pre-war growth of the industry.

CENTRALIZATION IN EASTERN STATES.

Of more interest, however, is the industrial development of the industry in such states as New Jersey, New York, Massachusetts, Pennsylvania and Connecticut. The strength of the rubber industry of the first two states named is now concentrated upon an ever-widening area around the cities of Trenton and New York, with New York and its economic dependencies gaining an increasing influence upon the industry. In watching the development of the rubber industry in that particular field it is necessary to view the whole industrial district comprising the city of New York proper, Jersey City and Long Island as an economic entity which it really represents. The great part of New York divided between the two states of New York and New Jersey binds the district and makes it practically indivisible for all industrial purposes. Labor floats easily over it and may be drawn from its outskirts without necessitating even the re-location of its homes. The supply of raw materials, the distributing facilities of the whole district, its resources of industrial energy are all the same. It will take many years before the economic possibilities of this vast district are exhausted and before the rubber industry will be forced to vacate.

But while the whole district of New York has proven of exceptional strength, its subdivisions are showing considerable differences as to their general suitability for the location of the enterprises of the rubber industry. High ground rents, expensive railroad transportation, and high trucking cost, have made the industrial development of many parts at the mouth of the Hudson river uncongenial for industrial development and permit their industrial use for only the industries that can settle in such localities owing to special character of their production. Industries producing staple goods and having to compete with factories working often under the most favorable competitive conditions can hope to prosper only if they can create the same favorable conditions in their own location. The rubber industry of New York, therefore, has selected locations outside the circle of the most progressive industrial development of the Metropolitan district and has endeavored to duplicate the favorable characteristics of a location in a small city with the advantages of having at its disposal the facilities of the big city.

The same tendency is shown in Massachusetts, where the rubber industry in the beginning found its home in Boston proper, but is now spreading rapidly to the suburbs and is flowing over to the smaller cities of the state. Connecticut and Pennsylvania finally represent the newest phase of the evolution of the industry by introducing the decentralization of the industry over a district with a distinct mixed industrial character.

SCIENTIFIC GROUPING OF INDUSTRIES NEEDED.

It is obvious that the location of any industrial enterprise cannot be a matter of entire indifference to its owners, neither can it remain so for the nation as a whole. If decentralization, therefore, is recognized as a desirable aim it should be encouraged. But the selection of the new policy should not mean an entire cutting adrift from the past. The world progresses by evolution and not by revolution. We cannot hope to be benefited by throwing over the old without having first provided for the new. This is particularly the case in the instance under consideration. Nothing can be gained by placing factories outside the great centers of their industry for only the purpose of decentralizing industrial effort. What is required rather is a more scientific grouping of industries in order to make them supplementary in their economic wants and effort.

A new rubber factory for instance might be most advantageously placed in a district having already a few chemical plants of a general nature. The existing plants may easily furnish their floating surplus of labor to the rubber industry and in turn the new rubber works might attract labor to assist the chemical industry during the period of their high peak of operation. Generally speaking, districts with mixed industries are always preferable to such as specialize because they offer larger opportuni-

ties for the new plant in respect to labor, supply of raw materials, and markets. Port cities and cities with a plentiful water supply will always attract the rubber industry. But the case of Akron shows that a large industry can very well prosper without the advantages of a port of its own.

The problem of location, of course, must always be dealt with strictly individually. But it is just for that reason that it requires more thought and care than is generally given to it by the man in search for a new factory site. The thousands of factory buildings, standing empty in the United States before the war because their owners had failed to take the apparently so essential precaution to inquire into their special suitability for the intended purpose, speak a language of caution. There is waste in this form of handling the fortunes of our industry that could easily be avoided. After all, the rent for these buildings and the cost of all industrial failures has to be borne by the few who are destined to succeed. Every failure, every mistake in one of those fundamental conditions, makes success more difficult and production more expensive.

PRESIDENT MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.

It is particularly fitting that John T. Christie should be president of the Mid-West Rubber Manufacturers' Association. He is a native son of the Middle West, and typifies the business

enterprise of that section. He was born June 28, 1878, at Waterloo, Iowa, and has lived in the Hawkeye state ever since. Following his education in the public schools of Des Moines, he began his business career with the W. W. Wise Ice Co., of that city. He was later elected Deputy County Treasurer, and upon the expiration of his term became a partner in the Harter-Christie Insurance Co., eventually acquiring sole ownership of the agency, which is still being conducted under his supervision.

JOHN T. CHRISTIE.

In 1915 Mr. Christie was one of the incorporators of the Hawkeye Tire Co., a Delaware corporation, and of the Hawkeye Tire Co., an Iowa corporation, both with an authorized capital of \$500,000 to manufacture and deal in all kinds of automobile tires, inner tubes, etc., and was elected president, which office he has since held. Under his leadership the company has made continuous progress, and it is through the success of this organization that he has become prominent as one of the most promising of the younger rubber men. A year after its incorporation the firm name was changed to the Hawkeye Tire & Rubber Co., and later the capitalization of the company was increased to \$3,500,000, and a new factory costing approximately \$350,000 was erected.

A man of rare executive ability, quick perception, keen business judgment, and deeply interested in every movement pertaining to the rubber industry, Mr. Christie was among the leaders in organizing the Mid-West Rubber Manufacturers' Association, and was its first vice-president. In December, 1919, he was elected president.

New Uses for Old Tires and Tubes.

WHAT TO DO with cast-off automobile tires is a burning question. Some 40,000,000 of them are now being discarded annually, and every year there will be more. Utilizing waste materials of every sort is one of the great problems of the times, and the item of old tires is of the first magnitude.

Both the practical and the facetious man has many suggestions to offer, and both have contributed much toward solving this great problem. With the best grades of crude rubber selling around half a dollar a pound and scrap rubber almost a drug on the market, the junk man will pay only fifty cents to a couple of dollars for a tire that when new cost \$20 to \$75. Plans to get more than the junk man offers have therefore appeared by the score.

THE BUSINESS OF SALVAGING USED TIRES.

The most feasible uses for discarded tires have been developed by rebuilding the best of them, dissecting the badly damaged ones in large quantities, reclaiming the rubber, stripping the fabric and using it again in numerous lines of manufactured goods. With tire duck selling at three to four times pre-war prices, weavers scarcely able to keep pace with the demand and a shortage of the best long-staple cotton, good peeled tire fabric has a monetary value worth considering; it is now the chief value of an old tire.

Repairable casings of guaranteed makes, prematurely discarded but not worn out, are first selected for rebuilding. Tires with perfect beads, only minor defects of fabric, but one or two small blow-outs and no rim-cuts or loose plies are the ones chosen. The beads are first removed with a bead trimmer, the bead fabric stripped off for reclaiming and the hard rubber bead

ASH SIFTER MADE FROM AN OLD TIRE AND WIRE SCREEN.

cores ground fine for use as hard rubber dust. The various plies of fabric are separated by a fabric stripping machine. This pulled fabric, single or multiple ply as specified, is extensively used in rebuilding and repairing tires, and for the manufacture of blow-out patches and reliners, as well as for a variety of small rubber articles requiring strong fabric. Tire accessories made up from sound pulled fabric, properly prepared, are recognized as equal in serviceability to such articles produced from new fabric.

PATENTED USES FOR OLD TIRE MATERIALS.

Quite apart from tire repair and manufacture, many new uses are being found for peeled fabric. Within the past year many patents have been taken out both in the United States and abroad.

Under F. L. Harley's United States patent No. 1,285,992 a new built-up fabric product is made by stripping the rubber from the tire carcass and subjecting the fabric body to heat and heavy pressure in order to thoroughly compress the rubber particles with which the fabric is impregnated and to vulcanize the two together. The resultant stock is then cut into pieces of proper size and shape for the purpose intended, the waste being ground

up, reduced to a mass, spread over and by pressure applied to the cut pieces, thereby forming a built-up stock.

J. J. Dettling and E. A. Tinsman in United States Patent No. 1,309,118 protect a method of stripping the built-up plies of fabric of a tire carcass from each other and reshaping segmental portions with the addition of rubber into leggings of fixed shape and outline.

According to British patent No. 121,043 of 1919, attachable soles and heels, heel tips and protectors are made by vulcanizing a layer of rubber or rubber substitute on to a foundation of waste canvas from tire covers or waste balata belting.

U. Chandeysson's French patent No. 488,979 of 1919 covers the utilization of used or unused pneumatic tires for the manufacture of soles, heels, shanks and uppers for shoes; of gaiters, saddle bags, etc.; and more generally of all articles of rubber or rubberized fabric.

Another French patent, No. 490,382 of 1919, granted to V. C. Thé-nant and L. Méliorat, is for the utilization of pneumatic tire casings for making lounging shoes of all kinds.

THE FUTURE OUTLOOK.

Probably this is but the beginning, and many patents along these lines will follow. Converting old tire materials to new uses promises to become a great business in itself.

BASKET FRAMES FOR BASKET-BALL ARE EASILY EVOLVED FROM DISCARDED BICYCLE TIRES.

Outlets for the stripped fabric are already developing rapidly, which takes care of one of the two principal factors. And new uses for great quantities of low-cost reclaimed rubber will soon be found to take care of the other factor. This latter field is one for the opportunist, the rubber chemist and the man of vision. The above are but a few of the suggested uses, however, some serious, some facetious.

HOME USES FOR OLD CASINGS.

More numerous and varied are the suggested uses for discarded tire casings. Some of the most amusing are those for the average home. To begin the list, an old casing with a circular

SECTIONS OF OLD CASINGS MAKE EFFICIENT DOCK OR FLOAT BUMPERS.

piece of wire screen cloth attached to one of the beads in place of the rim makes an efficient hand sifter for coal ashes. A lawn sprinkler of the ring type can be made by attaching a garden hose connection through the tread, punching numerous holes

together, applying cement and vulcanizing to make the ring water tight. Two or three sections of an old casing cut to proper lengths, the cut ends being sewed together with waxed thread to form rings of suitable diameter provide the basis of excellent tree-guards. Protective strips of wood are then placed vertically around the tree and lashed to the rings with tarred rope. Short lengths of old casings are useful for temporary repairs to leaky eaves gutters, and clincher beads cut from casings may be nailed to the bottoms of doors for weather strips. A novel baby's walking chair can be made with two old casings, one held above the other by a series of spokes from an old wire wheel run through them vertically and provided with several casters at the bottom. Probably a revolving wheel for pet squirrels could be made in much the same manner.

IN ATHLETICS AND RECREATIONS.

The gymnasium, athletics and outdoor recreations have brought forth a few ideas. In an improvised gymnasium two old casings may be provided with dependent nets and used as the baskets for basket ball. One such casing properly suspended and rigged makes a strong and nearly noiseless punching bag frame.

Tire sections of uniform length laced together along the beads and hung over the sides make effective motor boat buffers. They are also good dock and float bumpers when similarly attached. Small size whole casings encircling the wharf piles and supported by wooden floats within them are effective at all tides. Clowns and jugglers might even use old tires instead of the conventional circus hoop.

FARM USES.

On the farm quite as many schemes have been thought of. Pieces of tire casing cut to proper shape and combining tread rubber and fabric, it has been found, are effective for tapping heavy farm shoes to prolong their wear. A length of tire casing furnishes a convenient flexible means of conducting water occa-

A GRINDSTONE WATER TROUGH DEVISED FROM AN OLD CASING.

sionally from the pump to a trough nearby, yet does not prevent filling pails at the pump direct. Half a tire casing hung under a grindstone and filled with water gives an automatic stone wetter that will not rust. With four old casings and two tackle blocks a sling can be rigged to lift sick animals to their feet or support them while helpless. Old tire casings laid over the floor of a truck body afford an excellent shock absorbing layer on which to pile crates of eggs or other fragile merchandise. A pile of them in diminishing sizes and suitably fastened together has been suggested as a near approach to the much pictured conventional beehive. With a larger entrance cut at the base a small dog kennel could be made in the same way.

REPAIR SHOP SCHEMES.

In a small repair shop

old tires have their uses quite apart from furnishing patch stock for tubes and pulled fabric for stopping up blow-outs. A whole tire suspended over the door with a circular canvas replacing the wheel makes an excellent sign on which to paint the proprietor's name. A segment cut from a giant truck tire and mounted on a wooden stand provides a water trough in which to test patched inner tubes.

AN INNER TUBE MAKES AN IMPROVED "TROT-LINE."

IDEAS FOR THE GARAGE AND CAR.

For the home garage and the car itself there are still other uses to which old casings may be put. Cut into quarter sections and fastened to the sides of a garage door they make excellent bumpers. Old tires can be made to save new ones by using sections of them spread flat to pad the automobile stand. Similar sections of rim-cut tires with the non-skid tread little damaged can be attached to the running board of the car and used as mats for wiping the feet.

Turning to more practical ideas, an old casing cut into sections and with edges skived to form a very gradual beveled edge provides a useful collection of home-made blow-out patches. Rim-

EMERGENCY TIRE BOOTS CAN BE MADE FROM SECTIONS OF OLD TIRES.

cut tires with the beads cut away have been used as overshoes to prolong the tread wear of tires of smaller size, while the fabric carcasses of discarded tires with beads and all rubber removed have furnished many reliners to reinforce weak tires

a size larger. The overshoes may be sewed to the tire or held in place by occasional straps riveted to the edges and passing from side to side about the felloe of the wheel.

USES FOR DISCARDED INNER TUBES.

It should not be forgotten that more inner tubes are scrapped than are tire casings. As they are free from fabric, however, they are reclaimed more easily and do not present the problem that is found in the worn out casing. Suggestions as to their use are, nevertheless, multitudinous.

A GARDEN SPRINKLER EVOLVED FROM AN OLD INNER TUBE.

The whole inner tube, when too much patched to risk in a tire, yet still air tight, has several uses suggested and actual. Its buoyancy on the water when inflated is the delight of the bathers learning to swim, while fishing lines suspended from it are said to excel a "trot-line," as the motion of the waves jiggles the hooks and attracts fish to the bait. It is an effective life preserver, and in a double sense, for bootleggers have used the spare tires on their cars as containers for beverages having an alcoholic content greatly in excess of one-half of one per cent. With a length of pump hose attached to the valve stem an inner tube can be filled with water under pressure, slung over the shoulder and used to spray plants. To fill, slip the hose over a faucet and press the valve. Inner tubes have been used as tow lines for disabled automobiles, and they furnish swing ropes that give much amusement to children.

Part of an inner tube, including the valve, makes a serviceable

air pressure chamber for a brazing or soldering torch. The cut ends of the tube may be sealed by two clamps consisting of two pieces of wood drawn together by screws. The bag is inflated in the ordinary manner by a tire pump. For an outlet hose connection, a second valve stem and base from another discarded tube should be attached to the tube section and the valve inside removed.

Inner tubes cut with shears transversely into narrow strips furnish excellent elastic bands to put around documents. Lengthwise strips cut from them offer good substitutes for the long, slender coil springs used for sash curtain rods and to close screen doors. Pieces of all sizes and shape may be used for patch stock for mending other tubes, hot water bags, boot legs and various rubber articles. With the aid of shears and rubber cement, aprons and even overalls can be made out of large truck tire inner tubes for protection when washing cars or doing other wet work. A length of inner tube closed with cement at one end and having a ring support and handle of heavy wire at the other end makes a handy folding dipper for filling automobile radiators.

Note.—The illustrations used in this article were furnished by "Popular Science Monthly."

ELECTRICAL YARNS.

BEFORE THE WAR the electrical or insulating yarns used to cover wires conveying electricity, were spun almost wholly in this country. The war caused the demand for them to increase greatly, because insulated wires were used for new purposes, as, for instance, the airplane magnetos, which demanded very fine qualities. The yarns had to be imported, the amount in 1918 being 651,887 pounds, whereas in 1914 the importations were 12,256 pounds.

The electrical yarns imported are all gray, combed, mule-spun, single yarns, made of long-staple cotton, chiefly Egyptian (Abbassi (white Egyptian) or Joannovich. The growing of these cottons has nearly ceased and in 1918 much yarn of inferior tensile strength, in which American Allen seed was used instead of Abbassi, and Mitafi (brown Egyptian) in place of Joannovich, was imported. For extremely fine combs Sea Island cotton is essential; that was cut off by the British restrictions on the exportation of Sea Island, and by the ravages of the boll weevil in this country.

GROUP-WOUND YARN FOR WIRE INSULATION

In 1914 the chief item of import was 8,058 pounds of 117/1; in 1918 there were imports of 301,441 pounds of 97/1, of 181,829 pounds of 98/1, of smaller amounts of 78/1, 120/1, 140/1 and 117/1 and of a very little 200/1. Part came with a multiple number of single ends wound together on cheeses (tubes or cones), and part with one thread on large warp caps. The leading item is usually described on invoices as "97s super combed Joan twist on cheese, 6 ends laid flat," which, being interpreted, means that it is made of Joannovich Egyptian cotton, carefully combed, spun with a warp twist, and put up on cheeses with 6 ends wound on side by side. The number of ends grouped together in winding varies from 3 to 30, though 5 or 6 is the usual number. Occasionally the yarn is invoiced as 6/97, 12/97, 30/97 and so on; this would indicate, first, the number of single

yarns twisted or folded together, and, second, the individual yarn count; namely, that 6, 12 or 30 ends of 97s had been twisted together to make ply yarns. This would be misleading for electrical yarns, as they had not been twisted together.

Electrical yarns imported on warp caps are usually sold to thread mills or to firms which have facilities for winding them on cones and grouping together the number of ends desired. They supply electrical firms who use braiding machines in covering the bare copper wire with the grouped yarn. Yarns which come already grouped are ready for braiding. The English winding charges are low, but if the patented Universal machine is used for patent spools, they charge more than is customary in this country for the same work. The electrical yarns are supplied chiefly by Manchester and Bolton; some spinners do their own exporting, but in 1918 half the imports were in the hands of one Manchester agent who passed them on to one American firm.

IMPORTS OF ELECTRICAL YARNS BY COUNTS.

Count	1914.	1918.

WOULD STIMULATE FOREIGN TRADE.

A special invitation has been extended to members of the rubber industry to attend the Seventh National Foreign Trade Convention to be held in San Francisco, May 12-15, when special trade advisers will be present from the Far East, Australia and South America, and may be consulted by American business men. The Los Angeles and Seattle Chambers of Commerce are preparing special trade exhibits and a large number of Americans who are now doing business in foreign countries have been invited to attend. The National Foreign Trade Council is headed by James A. Farrell, president of the United States Steel Corp., and among the active members are A. C. Bedford, chairman of the board of the Standard Oil Co. of New Jersey; Robert Dollar, president of the Robert Dollar Co., San Francisco, California; Alva B. Johnson, former president of Baldwin Locomotive Works, Philadelphia, Pennsylvania; William Cooper Procter, Procter & Gamble Co., Cincinnati, Ohio; W. L. Saunders, chairman of the board, Ingersoll-Rand Co., New York City; John N. Willys, president of Willys-Overland Co., Toledo, Ohio; and Thomas F. Wilson, president of Wilson & Co., Chicago, Illinois. It is pointed out that Europe's debt to the United States means a drive of imports, and methods of offsetting it by expanding exports will be one of the chief subjects of the convention. Such kindred subjects as credit information, direct and commission selling, financing of foreign trade, etc., will be discussed.

Some Labor Problems in the Rubber Industry.

THE POST-WAR PERIOD has presented to the rubber manufacturer labor problems undreamed of in the cost-plus, work-or-fight era from which we have just emerged. Radicalism and strikes have fortunately been less frequent and serious than in many of the allied industries, but this circumstance has not blinded the manufacturer to the necessity of a fair and liberal labor policy. For enlightened production, men realize that a high labor turnover is expensive.

Acting upon this principle, they have granted two wage increases in the rubber shoe field during the past six months and have secured the cooperation of the workers themselves by more intelligent welfare work, shorter hours, schools for non-English speaking employes and schools for foremen, all of which have helped toward the goal of increased production.

WOMEN WORKERS INCREASING.

Owing to the war the influx of women in rubber manufacturing of all kinds has been notable. Twenty per cent of the factory work in the plant of The Goodyear Tire & Rubber Co., Akron, Ohio, is done by women. Among the jobs performed by women workers are: finishing tires, cutting and splicing fabrics for balloons, weighing rubber, molding and trimming rubber heels, operating electric trucks, running machines for refining and straining reclaimed rubber, running rubber washing machines, splicing and trimming tire tread bands, making tubes, and separating sheets of rubber. The war also proved that the work of time clerks, inspectors and stock room attendants is ideally suited to women workers. In the rubber shoe industry women have been employed from the beginning. They are used in the cutting room for sorting and booking work, in the preparatory departments for stitching tennis uppers, making quarters, cementing linings and inside work, and in making gum shoes and gaiters. Inspectors and forewomen in these departments have nearly all graduated from the bench. Among the more recent jobs for which women are being trained are making boots and heavy gaiters, formerly done exclusively by men, and operating clickers and cutting machines. The introduction of sole layers and machine lasters has removed the former obstacle of strength required to perform these operations.

The bettering of working conditions has been a direct result of the increased number of women workers. The factory nurse and the rest-room have been introduced. Some factories make a practice of serving hot coffee or tea during the morning hours. Boarding and lodging houses, even in the larger cities, and day nurseries where mothers can leave their children under competent care while at work, are signs of the times.

HOW TO ENCOURAGE REGULAR ATTENDANCE.

Irregular attendance is the greatest problem with female help. In rubber shoe manufacturing this not only means loss of production but also the danger of valuable material, cemented and prepared for making, becoming air cured and scrapped. One factory takes care of this by having several "drop" teams of workers who make up the tickets of the girls who are out. Others have tried giving a weekly bonus for perfect attendance, but in these days of high wages this scheme has lost its appeal. A more recent idea has been the creation of a spirit of rivalry between team and individual workers for the best record of "firsts" with a prize for the winners which they hold only so long as they can maintain their record.

Still another idea has been the "committee" system in accordance with which groups of workers are organized under the heads of "attendance" committees, committees on "economy and efficient production," etc. One objection to this system is that if

it is not carefully handled it may create jealousies among the operators, and be looked upon either with suspicion or jealousy by the girls not included.

Baseball teams in the summer, and a bowling league with each department represented by a team in the winter, serve to stimulate teamwork and interest among the men, and if this interest is fostered by the factory paper it will often lead to beneficial results. Foremen and executives can help matters a great deal by showing a knowledge of the games and interest in them by their attendance at matches between rival teams. Along the same lines, one factory holds a dance every day during the noon hour and reports that it helps a great deal toward keeping the women workers in regular attendance and contented and happy.

FAULTS OF THE EMPLOYMENT DEPARTMENT.

The employment department in itself is not especially new, but manufacturers are watching and studying it more closely than ever. How does it function? Are the applicants for employment examined for the job to determine their qualifications or are they picked in hit-or-miss fashion? If there is no job available for the applicant at the time, how is he turned down? A letter from a rejected applicant woke one concern up to the fact that it was losing its reputation and help as well by the cold-blooded policy of its employment department. The man had waited an hour and a half for an interview only to be told finally by an office boy that all the jobs had been filled. He had no opportunity to talk to anyone in authority and went away in an exceedingly bitter frame of mind.

One morning not long ago a man about 45 years old and of slender build walked into the employment bureau of a rubber company and asked for work. The only job available was trucking rubber from the freight cars to the stock room. "It's a very heavy job. I don't know whether you would want it or not," he was told. "How heavy?" asked the man. "Oh, the rubber weighs from 200 to 300 pounds a load," was the answer. The man was obviously unsuited to the job, yet he hesitated. He needed the work. "Take it or leave it," was the impatient rejoinder from the narrow, forbidding ticket window. The man did not take the job, but if he had he would have been allowed to take it. Many of the large concerns now require a physical examination of all applicants, and in this case, it would have been a protection for the worker as well as for the employer.

START THE NEW WORKER RIGHT.

Much depends upon the first day on the job for the new employe. If he is kept idle for several hours waiting for the busy foreman to assign him to his task, he naturally forms the impression that time doesn't amount to very much in that particular plant. There are many things he wants to know about the working conditions which very often he has to pick up from his fellows. When do they pay? How much time do they have for lunch? Any morning rest periods? Any smoking privileges? Where are the sanitary accommodations located? These are little things, but to the new man they are the things he naturally wants to know.

Nearly all of the waste of material and petty pilfering caused by green employes can be laid at the door of the foreman who failed to instruct his men. The workman who cut a piece of tire duck from the roll and used it for a towel was not wholly to blame. Not more was the apprentice shoemaker who mixed her upper scrap with the friction trimmings. Breakage of cases in the packing and shipping room is a loss often allowed to continue without any attempt to check it. "Fat, you wouldn't tear up a five-dollar bill, even if it wasn't yours, would you? Well,

that case you just smashed cost this company just that," may sound trite, but it is often effective. The war and this era of high prices have taught workers to save through Liberty Bonds and War Savings Stamps, and the lessons can very readily be applied in the shop. Getting started right is half the battle. The shipyards and munition factories demonstrated that green workers often turn out better than experienced hands because they had nothing to unlearn. It was possible to teach them the exact methods of the concern without encountering opposition due to methods learned in other shops. The story is told of an experienced carpenter employed in an airplane factory. All his life he had been used to trimming off ends of boards that stuck out. He ruined \$700 of seasoned ash in a very few minutes by sawing off the ends of some partially constructed planes.

Some factories separate the training of apprentices entirely from the regular departments, particularly in the case of shoemakers, tire builders, etc. In the mill room there is opportunity for training operators through various stages. Operators come in as helpers, whose duty it is to change rolls and carry stock; later they become mill men, then assistant calender hands, with the chance to become calender men. Similarly in the cutting room, workers can start as stock carriers and work up to clicker and Parsons machine operators.

RUBBER WORKERS OF THE OLD SCHOOL.

But what of the old rubber workers who served their apprenticeships forty years ago? No rubber shop to-day is complete without them. What a picturesque lot they are, playing their knives with sturdy strokes over in the far corner of the cutting room where the long rows of machines have crowded them! They openly scoff at the youngsters, to be sure. But spend a lunch hour getting acquainted with them. They will tell you of rubber shops long since closed and incidentally give you a friendly tip on foremen who have come and gone. They swear at the makers who are always "short" and ask you where they lose or scrap the work, yet they cut it over just the same. They chew tobacco and take snuff, but what of that? There are few industries to-day which have as loyal and as hardworking men in the ranks as these fellows of the old school.

THE IMPORTANCE OF EFFICIENT FOREMEN.

Rubber factory executives have gradually learned to appreciate the fact that the labor problem rests a great deal with their foremen. The college professor who went into the steel mills during the war disguised as a laborer, was not far wrong when he said to the general manager, "Your men are fine; but your foremen are a bunch of blackguards and slave drivers." Foremen are being sent to school not only to learn the technical side, but also to emphasize the human side. The day has gone when the foreman can order his men as a sergeant would a platoon. In those days there was a line of men waiting outside to take the job of the man who fell down. To-day that man can go across the street and get as good a job or better. And he knows it. He cannot be bullied or coddled. The foreman fires a man to-day only as a last resort in exceptional cases. When he does, he has lost.

It is an unwarranted assumption to take it for granted that the workman is interested in the product. He is not. He is only there because it brings him the wherewithal to get what he wants and needs. And their interests are as wide apart as the two poles. "John, how is the new baby getting along?" "Mike, are the hens laying well?" "George, have you got your house painted yet?"—these are the things that interest men. I saw a foreman not long ago stop to admire the pictures of three children, proudly displayed by their father, a rubber worker. The man was a piece worker, yet he stopped five minutes to display them. That production time lost was more than made up to the company by the good-will it created. Usually the way a man feels toward his foreman is the way he feels toward the company and his job.

MAINTAINING PLANT MORALE.

A wide-awake executive can scent trouble in his plant and nip it in the bud. It takes very little these days to start wild rumors. Some petty grievance of a workman is magnified by gossip; piece rates obviously unfair; carelessly worded and ambiguous notices; petty rules; a thousand little things can impair morale irretrievably if not watched. Not many weeks past I heard a workman berating the company as crooked. His argument was based on a story that six months previously a workman had left, having paid six installments on a Liberty Bond, amounting to five or six dollars, and the company had only returned 50 cents to him. Upon investigation it was found that there was nothing to the story at all; but that did not prevent it from being repeated and doing harm.

Many pay-rolls are full of unfairness, due to the weakness in management which allows a group of workmen to secure a raise for themselves by making threats, while the more efficient yet timid ones plug along at the old rates. Records of work performed are the true basis for promotion. And nothing is gained by secrecy regarding production methods or records. Gradually the old mists which have obscured rubber shops for a quarter of a century are clearing away. Men are beginning to hark back to Solomon who said "There is nothing new under the sun." The old type of foreman who put off with vague and false answers the ambitious workman with a desire to learn has now discovered that his prized trade secrets are no longer of value to anyone except himself as keepsakes. Education, fairness and equal opportunity for all, with the plums for ability, are the new standards.

RUBBER WORKERS A FAVORED CLASS.

Ten years ago the man just out of college who went to work in a factory was scoffed at. Most of the graduates flocked to offices and banks for a "white-collar" job. The personnel of the graduates is changing now; the sons of the mill hands are beginning to outnumber the sons of the directors. And the whole thing is reversed. The factory worker's son seeks the office job, and the director's son is going into the shop. What does he find in the rubber factories? Instead of the bushy-bearded I. W. W. he finds a cheerful, wholesome class of people, proud of their occupation and holding shares in the corporation. If a census were taken of the so-called labor class in the rubber industry many of them would be classed as capitalists. For rubber workers are noted for sticking to their trade, and many are part owners in the shops where they work.

The purpose of this paper is not point out a royal road to a cure-all for labor troubles. There is none. Rather is it to indicate the tendencies of the times which combine to make the problem. The actual solving of it depends upon the individual manufacturer's condition which only he can know and analyze for himself.

LOOKING FOR BETTER HEVEA.

The scientific improvement of plants that are cultivated for commercial purposes in tropical countries is urged as a necessity by Professor W. Bateson in "Production." In his brief survey of rubber, one of the commodities he deals with, he takes the same point of view as that of J. P. Romein in *THE INDIA RUBBER WORLD*, October 1, 1919, and proposes much the same mode of action. He thinks the government scientific stations should pick out the best yielding *Hevea brasiliensis* trees and distribute cuttings from them to planters. The attempt to do this on a large scale at Peradeniya in Ceylon was a failure, as only one cutting in 3,000 succeeded, but the method has worked with no great difficulty in other cases. It is from cuttings and not from seeds that improvement in *Hevea* must be looked for.

"RUBBER MACHINERY" BY HENRY C. PEARSON, IS FILLED WITH valuable information for rubber manufacturers. Price \$6.

Rubber Tariffs of Europe.

THE UNITED STATES in 1918 exported manufactured rubber goods to European countries to the amount of \$6,055,568, a sum about one-half that obtained for rubber exports in 1917 and less than a third of what Europe paid in 1916. The value reverts to that of the trade before the war. The change from the fiscal year running from July 1 through June 30 to the calendar year, January-December, makes the comparison with previous years, somewhat confusing, inasmuch as the exports for the fiscal year 1917-18 were \$9,500,763 but fell off so rapidly in the last six months that the total for the calendar year 1918 was only \$6,055,568.

There is a marked decline, not only from the too busy war years, but also from the years before the United States entered the conflict. The only exception is in the item of rubber boots of which there were phenomenal exports in the first months of the year. The best customer was France, which took about two-

cans have been successful; as in the campaign the Dunlop Rubber Co. has initiated and proclaimed.

While the countries which have suffered and are still suffering from the lack of rubber during the war years are letting the tariff bars down for raw materials and even in many cases for manufactured goods, the Entente Powers, even those inclined to free trade, alarmed at American progress, are imposing protective restrictions, which, even if they do not take the form of tariff duties, make it difficult for foreign, and especially American, goods to enter their countries.

The succeeding extracts from the traffic of the principal countries of Europe show the competition to which rubber manufacturers of the United States are subject under existing tariff conditions. Owing to frequent tariff changes the figures and information given below should be periodically verified and small trial shipments made to test the rates:

*Calendar year 1918.

thirds of all the exports, \$4,155,457 worth, and nearly three times as great a value of rubber goods as England, the next on the list.

France's investment was \$2,120,031 in rubber boots and \$105,570 in shoes; she also took \$901,013 of automobile tires and \$947,480 of miscellaneous goods including druggists' sundries.

England was the main purchaser of belting, hose and packing, buying \$144,724 worth; she took \$232,983 worth of rubber boots, \$198,022 of automobile tires and \$782,386 of miscellaneous goods. Italy, third on the list, invested nearly all her \$259,463 in miscellaneous goods; the three Scandinavian countries—Denmark, Norway and Sweden, each bought from \$40,000 to \$60,000 of American goods and Iceland put \$16,833 into chiefly rubber boots and shoes.

The amazing drop in shoes from 2,404,052 pair in 1916-17 to 298,064 pair in 1917-18 and 91,581 in the calendar year 1918 may be due to oversupply, and doubtless in many lines the end of the war left big stocks in government hands. The falling off is partly due to the ability of the belligerent countries to turn men into their own factories, partly to the difficulties imposed on international trading by the drop in the rates of exchange, but seems also due in part to deliberate and aggressive endeavors to win for home manufactures the markets and goods where Ameri-

3.	India rubber, gutta percha, balata.....	Free
217.	India rubber, gutta percha, manufactured:	
a.	In sheets, including rubbered paper, rods, cards or threads, hose cables, blocks, buffers and rollers, even when combined with thread or tissues.....	Free
b.	Soles, rings, floor mats, pads for horsehoes, even when tread or tissues are inlaid in these articles.....	0.30
c.	Gloves and other footwear.....	1.00
d.	Other not specially mentioned.....	1.00

*No reduction allowed for weight of boxes, cards or paper wrappers.

PORTUGAL.

Equivalents.—Escudo, 1/100; kilo, 2.2 pounds.

Tariff No.	General Tariff.	Conventional Tariff.
47.	Rubber, gutta percha, ebonite and similar composition, crude and semiprocessed.....	0.015
295.	Rubber or gutta percha in waterproof or elastic silk tissues.....	2.50
296.	Surtax in addition.....	0.50
297.	In waterproof or elastic woolen tissues.....	1.50
298.	In waterproof or elastic cotton or linen tissues.....	1.00
314A.	Corsets of mercerized thread combined with rubber or gutta percha.....	2.00
	Surtax in addition.....	1.50

Tariff No.	General Tariff.	Conventional Tariff.
441.	Rubber and gutta percha, manufactured, not elsewhere mentioned.....	0.60
442.	Combs.....	2.00
557.	Tubes and thread.....	0.025
	Insulated wire.....	0.04
17.	Ribbons, and belts thereof, all kinds, even combined with elastic, gutta percha, etc.:	
(a)	Of silk, pure or mixed with metallic thread.....	10.00
(b)	Of half silk.....	5.50
(c)	Of wool.....	1.60
(d)	Of other.....	1.40
204.	Other.....	1.70
	Note 2.—In the case of (c) and (d) the weight assessed for duty shall include that of spools, boxes, paper wrappers and similar immediate packing	
	Clothing and made-up articles of tissue not specially mentioned in the tariff:	
1.	Impregnated or coated with oil, varnish, rubber, etc., or manufactured of such stuff:	
290.	a. When the tissue is wholly or partly of silk.....	6.00
291.	b. When the tissue is wholly or partly of wool.....	2.60
292.	c. Other.....	1.10
394.	Machine belts and transmission belts of all kinds, and sewing machine belts.....	8% 12%
	Veils.—Belts may be admitted free of duty if it is proved that similar articles are not manufactured in Norway.	
395.	Machine packing and engine cables.....	Free.
	Tissues:	
1.	Waterproof, painted, varnished, lacquered, impregnated or combined with rubber or gutta percha:	
694.	a. Emery cloth and sand cloth.....	0.20
695.	b. Tarpaulins, other goods weighing 250 grams or more per square of half meter side.....	0.18
696.	c. Roller window blinds.....	1.10
697.	d. Other goods, the stuff of which is wholly or partly silk.....	2.50
698.	e. Other goods not enumerated in the four preceding numbers.....	0.60
730b.	Outer covers for rubber tires for automobiles, all kinds.....	0.30

Equivalents.—10 cents; kilo, 2.2 pounds; g.w., gross weight.

Tariff No.	General Tariff.	Conventional Tariff.
455.	CRUDE RUBBER, ETC.	
	Crude rubber and gutta percha, in bulk, and broken articles of rubber.....	0.50
	100 kilos, g.w.	1.50
456.	PASTES, ETC.	
	Solutions and pastes of rubber.....	5.00
	100 kilos, g.w.	2.00
462.	BELTING, HOSE AND PACKING.	
	Technical articles of rubber, combined or not with other materials, and not specially mentioned with cotton or other materials.....	50.00
	100 kilos	6.00
79.	BOOTS AND SHOES.	
	Boots and shoes of any materials, with or without rubber heels and soles.....	100 kilos 650.00
461a.	Gloves and tennis shoes.....	7.50
	100 kilos	120.00
392.	OTHER GOODS.	
	Braces, garters, belts, with or without rubber thread:	
a.	Plain, of cotton, wool or linen.....	3.00
b.	Ornamented, of cotton, wool or linen.....	5.00
	100 kilos	0.10
394b.	Artificial flowers and parts of flowers of gutta percha, etc.	4.00
457.	Plates and rods of rubber.....	10.00
458.	The same combined with tissues, etc.....	20.00
459.	Articles of rubber and rubber thread.....	40.00
460.	The same combined with other materials, but not made up:	
a.	Threads, stuffs, bands, elastic ribbon of rubber threads, covered with common textile materials, cotton, linen.....	100.00
b.	The same covered with silk, pure or mixed with other textile.....	300.00
	(Note.—Elastic ribbons with rubber threads covered with textile materials used in making garters, shall be taxed under No. 460 a or b, as the case may be, even though not containing rubber threads on the edges and having the appearance of ordinary ribbons.)	
461.	b. Cloaks, cloth and other made up articles.....	250.00
	(Included are articles made from tissues coated with rubber or gutta percha on one side only, varnished or not, or from double tissues with intermediate layer of rubber or gutta percha.)	
462.	All other articles of rubber combined or not with other materials, and intended for medical or professional use.....	50.00
463.	Articles of vulcanized rubber combined or not with other common materials, such as combs, vaporizers, rulers, paperweights, pads, articles of dress, and other wares.....	240.00
750c.	Insulated cable and wire.....	15.00
809.	Technical specialties.....	85.00
	Special rubber.....	100.00

*A tax of 3% per cent is levied on the value of merchandise imported or exported through Rumanian ports.

*By convention the duty for Germany is 50.00 lei.

SERBIA.

Equivalents.—Dinar, 19 cents; kilo, 2.2 pounds.

Tariff No.	General Tariff, Dinars.	Conventional Tariff, Dinars.
CRUDE RUBBER, ETC.		
100. (i) Rubber, gutta percha, balata, substitutes, not manufactured	Free.	Free.
PASTES, ETC.		
252. Rubber and gutta percha cements	100 kilos 12.00	100.00
392. Soft rubber paste	100 kilos 50.00	30.00
401. Paste of hard rubber, vulcanized or not	100 kilos 100.00	30.00
BOOTS AND SHOES.		
395. Rubber boots and shoes, even combined with textile and other material	100 kilos 250.00	140.00
TIRES, ETC.		
394. Rubber tires for carriage wheels, covers for same, wheels, etc.	100 kilos 150.00	120.00A.
OTHER GOODS.		
392. Rubber, gutta percha, balata, refined, mixed or not with other material, colored, vulcanized or not in pieces, plates or patch sheets, but not further manufactured	100 kilos 50.00	30.00
393. Rubber threeds	100 kilos 100.00	50.00
(i) Solely of rubber	100 kilos 100.00	50.00
(ii) Covered with other materials	100 kilos 200.00	100.00
394. Tubes, straps, strips, also tissues saturated or coated with rubber and gutta percha, with linings or layers of rubber and gutta percha, or with layers of tissues, even combined with common metals and their alloys	100 kilos 150.00	120.00A.
396. Floorcloths, even combined with other materials	100 kilos 150.00	120.00
397. Tissues, felt and knitted stitches, coated or saturated with rubber or gutta percha or with a layer of rubber or gutta percha:		
(i) Silk or half silk	100 kilos 300.00	300.00
(ii) Other textile goods	100 kilos 200.00	130.00
398. Articles not otherwise mentioned, not vulcanized rubber, also wholly or partly covered, or saturated with rubber:		
(i) Solely of rubber or combined with common or fine material	100 kilos 450.00	150.00
(ii) With the finest materials	100 kilos 600.00	300.00
(iii) With precious metals:		
a. With gold	100 kilos 1,000.00	700.00
b. With silver	100 kilos 800.00	450.00
399. Elastic tissues, knitted goods and trimmings of every kind if the value is at least:		
(i) Silk or half silk	300.00	220.00
(ii) Other textile materials:		
a. For shoemakers	150.00	120.00
b. Other	200.00	170.00
(Note)—Embroidered goods of this kind pay a surtax of 30 per cent.		
400. Tissues and other manufacturers of rubber, or of other stuffs, combined with rubber or gutta percha for technical purposes, not mentioned or included elsewhere	100 kilos 60.00	36.00
(Note)—Clothes and other goods of this kind made up with glue are dutiable as finished goods.		
401. Hard rubber or gutta percha in sheets, bars, threads, polished but not further manufactured; unmanufactured sheets combined with other materials; unwrought stamped wares	100 kilos 100.00	30.00
402. Tubes of hard rubber	100 kilos 200.00	120.00
403. All other goods of hard rubber and gutta percha, combined or not with other materials if thereby they do not come under a higher duty:		
(i) Of rubber alone or combined with common or fine material	100 kilos 400.00	200.00
(ii) With the finest materials	100 kilos 600.00	300.00
(iii) With precious metals:		
a. With gold	100 kilos 1,000.00	800.00
b. With silver	100 kilos 800.00	600.00
(Note)—Goods of imitation rubber or gutta percha are dutiable as if of rubber and gutta percha.		

SPAIN.

Equivalents.—Pesceta, 19 cents; kilo, 2.2 pounds; n. w., net weight; g. w., gross weight.

For the purpose of the application of the privileged treatment resulting from different commercial treaties and conventions in force the countries are divided into four groups:

Group 1. Countries bound by treaties at present in force:—Denmark, Norway, Netherlands and colonies, Portugal, Switzerland and Sweden.

Group 2. Countries entitled to all customs benefits, save such as are accorded to Portugal, Germany, Andorra, Annam, Austria-Hungary, Belgium, Bulgaria, Costa Rica, Ecuador, United States and Porto Rico, Cuba, Chile, China, France and Algeria, Great Britain and colonies, Greece, Guatemala, Japan, Luxembourg, Morocco, Mexico, Nicaragua, Paraguay, Persia, Peru, Argentina, Romania, Russia, Salvador, Siam, Siam, Tunis, Turkey, Uruguay and Venezuela.

Group 3. Nations entitled to benefits of duties of second tariff:—Colombia and Ecuador.

Group 4. Countries subject to duties in first tariff. All countries not enumerated in the foregoing groups.

In order that goods and products of countries mentioned in groups 1, 2 and 3 marked with letter C in the tariff, may enjoy benefit of the lowest rates of duty or, as the case may be, of those stipulated in the second tariff, it will be necessary to present a certificate of origin.

RUBBER, CRUDE OR PARTLY MANUFACTURED.

Tariff No.	First Tariff, Pesetas.	Second Tariff, Pesetas.
695. Rubber, gutta percha and similar materials, raw or manufactured into threads (g. w.)	0.06	0.06
BELTING, HOSE AND PACKING.		
696. Hose pipes, tubes, rings and sheets, strengthened or not with iron or brass wire, cloth or other materials (n. w.)	2.00	1.30
697. Belts, washers, packing discs, valves, horsehoes, combined or not with other materials (n. w.)	3.00	2.00
BOOTS AND SHOES.		
700. Elastics for boots and shoes (n. w.)	3.00	2.70
701. Treaties with Switzerland (n. w.)	2.00	2.00
703. Boots and shoes, combined or not with other materials, except leather (n. w.)	4.00	3.00
TIRES.		
697. Solid tires of rubber for carriages (n. w.)	3.00	2.00
698. Solid tires of rubber, with metal armor (n. w.)	3.00	1.20
699. Covers or inner tubes for all vehicles (n. w.)	5.00	2.70
OTHER GOODS.		
528. Apparatus and instruments for use in medicine, surgery and laboratories (n. w.)	5.00	5.00
529. Common gymnastic and orthopedic apparatus (n. w.)	2.00	2.00
700. Elastic braces, garters and similar articles (n. w.)	3.00	2.70
701. Waterproof tissues, in the piece or cut (n. w.)	5.00	3.60
702. Waterproof and other articles of clothing, sewn or not (n. w.)	8.00	5.60
(Note 100). By "waterproof tissues" to be understood tissues coated on one or both sides with rubber, also those saturated inside with this material.		
704. All other rubber goods except instruments, toys and writing materials (n. w.)	6.00	4.00
707. Toys and games (n. w.)	4.00	3.00
709. Writing materials, not specially mentioned (n. w.)	2.50	1.50

SWEDEN.

Equivalents.—Krona, 27 cents; kilo, 2.2 pounds.

Tariff No.	Duty in Kroner.
CRUDE RUBBER, ETC.	
631. India rubber, gutta percha, balata, unmanufactured; also regenerated rubber	Free.
PASTES, ETC.	
632. Rubber dissolved or in the form of paste (but not rolled into sheets or further manufactured), with or without admixture of other substances; also artificial soft rubber	0.15
BELTING, HOSE AND PACKING.	
634. Sheets not more than 10 millimeters thick having layers of textile material within or around them; other engine packing, insulating materials and packing of soft rubber, combined with textile materials, metal or asbestos, or of textile or other material combined with rubber	0.25
635. Hoof and other pads (buffers), springs and engine packing, n. e. s.	0.50
637. Hose and pipes, even if cut in lengths and finished, n. e. s.	0.50
638. Spiral piping and protected piping, even if provided with couplings or other fittings	0.30
639. Hose of cotton, hemp or linen impregnated or not; and coated internally with a thin layer of rubber not more than 2 millimeters thick	Free.
640. Other, combined or not with other substances, including so-called inner tubes, unified or not joined without valve patches and valves	0.50
641. Belting of rubber, gutta percha or balata, combined or not with textile material	0.35
642. Hard rubber engine packing	0.50
BOOTS AND SHOES.	
641. Rubber boots and shoes	1.20
TIRES, ETC.	
636. Solid tires, even if in lengths	0.80
642. Rubber parts of cycle and motor cycles, n. e. s., even if combined with other materials, such as inner covers or parts thereof, rubber parts of pedals and brakes	1.60
OTHER GOODS.	
636. Mats, stoppers, rings for sewing machines, valves, balls, nut valves and rubber gaskets, n. e. s., not industrial purposes, all combined or not with other materials; cords	0.80
643. Other articles made of soft rubber, combined or not with other materials, such as gloves, pails, mugs, pipes, ice bags, surgical appliances, and erasers	1.20
(Note 100). Manufactures of gutta percha, balata and artificial soft rubber, are treated as manufactures of soft rubber.	

MANUFACTURES OF HARD RUBBER, COMBINED OR WITH OTHER MATERIALS.

644. Blocks and sheets, even if in pieces cut out and finished	0.50
645. Rods, threads, pipes even if in pieces, cut out and finished	0.50

Tariff No.	Knife handles and materials therefor.	Duty in Kroner.	Tariff No.	Trusses, corsets, dorsal and thigh bandages, splints; orthopedic apparatus; dental mastic, sheets of rubber for artificial plates and gums, teething caps worn around the neck, syringes of all kinds; irrigators, cylinder pumps, etc.	General Tariff Rates.	Conventional Tariff Rates.
647.	Other articles, n. e. s., of hard rubber, combined or not with other substances, such as surgical appliances, combs and the like.	1.20	939.	Elastic stockings.	50.00	40.00
648.	Waste rubber and worn-out articles of rubber.	Free.				

A (*) placed before a number means that the whole is conventionalized, unless otherwise stated; the conventional provisions result from the commercial treaty concluded with Germany on May 2, 1911.

TARE ALLOWANCE.

The tare shall be calculated in accordance with the following percentages, unless the packing is to be included in the dutiable weight of the goods:	
For wrappings of a single tissue.	2%
For wrappings of double tissues or mats.	3%
For barrels or cases.	12%
For boxes or bottles of sheet metal.	10%
For boxes or bottles of lead, iron or copper.	20%
For bottles of glass and flacons or jars of earthenware.	40%

SWITZERLAND.

Equivalents.—Franc, 19 cents; quintal, 230 pounds.

Tariff No.	CRUDE RUBBER, ETC.	General Tariff Rates per Quintal.	Conventional Tariff Rates per Quintal.
516.	Crude rubber and gutta percha, "Patent Platten," not vulcanized; rubber and gutta percha waste.	Free	Free

BELTING, HOSE AND PACKING.

517.	Joint rings for w. e. piping.	5.00	1.00
518.	Hose, tubes, pipes.	10.00	5.00
522.	Hose and tubes with metal joints.	20.00	8.00
523.	Belting.	30.00	20.00
635.	Asbestos and rubber packing, kingerrite rings.	12.00	

BOOTS AND SHOES.

191.	Roughly shaped parts of boots and shoes of rubber or gutta percha.	45.00	40.00
198.	Boots and shoes of rubber combined with other materials, except leather.	40.00	30.00

DRUGGISTS' SUNDRIES.

528.	Waterproof sheeting for sanitary purposes.	40.00	30.00
529.	Rubber sponges; molded articles of rubber.	40.00	25.00
938.	Surgical and medical instruments and apparatus, including inhalers.	40.00	16.00

OTHER GOODS.			
517.	Rubber or gutta percha in strips, sheets, plates, plugs, molded articles, threads, balls, rods, rings of rubber without internal layers of another material.	50.00	1.00
519.	Threads for elastic tissue.	Free	
520.	Carpets, mats, etc., with internal layers of metal or brass.	40.00	20.00
521.	Plates, rings, balls, strips, bands, etc.	10.00	5.00
525.	Gummed tissues for industrial purposes, stuffs for cards, cylinder covers for printing, insulating stuffs and tapes.	40.00	20.00
526.	Rubberized stuffs (double) for cart lifts, etc.	1.00	
527.	Elastic tissues of all kinds for shoes, gloves, braces, garters, etc.	30.00	
528.	Rubber coated fabrics and other materials on which rubber is applied.	40.00	30.00
529.	Articles not otherwise mentioned; including rubberized fabrics for waterproof overcoats; clothing for laborers working in water; rubber booters for automobiles; rubber shoes for ladders; molded articles of rubber.	40.00	25.00

ELECTRICAL CABLES AND WIRE; CORE INSULATED WITH RUBBER; GUTTA PERCHA, ETC., NOT COVERED WITH TEXTILE MATERIALS, TWISTED OR PLAITED.

824.	Cables without lead sheathing or iron armature; insulated wires.	30.00	18.00
825.	Cables with lead sheathing.	15.00	12.00
826.	Cables with lead sheathing and iron armature, core insulated with rubber, gutta percha or rubber covered with thread or silk twisted or plaited.	15.00	12.00
827.	Cables without lead sheathing.	30.00	15.00
828.	Cables with lead sheathing.	30.00	15.00
1145.	Stopper.	60.00	30.00
1159b.	Rubber stamps, rubber erasers.	30.00	25.00

Italy, 40 francs.

TURKEY.

All imported goods, except gold and silver articles, precious stones, tobacco, are liable to a duty of 11 per cent.

Government Standard Specifications for Rubber Tires, Tire Repairs and Accessories—II.¹

SOLID MOTOR TIRES.

Specification GS 1030.

GENERAL. (a) This specification covers requirements for "pressed on" type tires provided with the standard channel base band of tire manufacturers, and shall be suitable for pressing on to S. A. E. standard felloe bands for commercial-sized wheels on bands built to S. A. E. tolerance for artillery wheels.

(b) Full-sized drawings shall be submitted with proposals showing the exact section of the tires which it is proposed to furnish. Sample section of the actual tire in each size shall also be submitted.

(c) See General Specifications for Tires¹, which are a part of hereto.

CONSTRUCTION.

The total weight of tire, weight of rubber, weight of steel base band, together with the total sectional area of tread rubber in tires and also the area of tread rubber above the tops of steel channels must be definitely stated in proposals, and this data will be given due consideration in connection with the prices submitted.

Tires 10 inches in width and larger shall be provided with approved grooving on face of tire.

The tire base band shall be made of open-hearth steel and rolled to approximate finished dimensions. Chemical analysis shall be as follows:

¹ The General Specifications referred to in these specifications were published on page 351, in THE INDIA RUBBER WORLD, March 1, 1920.

Carbon, 0.12 to 0.22—0.17 desired; manganese, 0.35 to 0.55; phosphorus, less than 0.04; sulphur, less than 0.05.

Base bands are to be electrically welded. They shall be truly circular and free from appreciable warp.

Dimensions of base bands: The inside circumference of base bands of tires of standard S. A. E. commercial sizes shall be in accordance with standard practice of tire manufacturers, but manufacturer must guarantee tire shall not come off when applied to standard S. A. E. wheels. Tires made for artillery wheels shall have the inside circumference of base bands made in accordance with dimensions and tolerance given on Ordnance Department drawings.

To determine the effectiveness of the welding process used, pieces of base band metal not less than 8 inches in length will be welded together and turned down to a standard specimen and three such samples containing welds pulled in a testing machine. The total pull required to separate each of the three welds shall be more than 45,000 pounds per square inch of cross section.

In order to determine whether the base bands are being properly welded in production, the inspector may, from time to time, require a weld on the finished tires to be tested in the manner described above. The strength of the welds in production shall be not less than 45,000 pounds per square inch of the section as tested above.

MARKING, WRAPPING AND PACKING.

(a) All tires shall have molded on the side of the tread rubber the words "U.S.A." and the tire size, i. e., the width and diameter and also the rubber compound or specification number,

the tire serial number, month and year of manufacture, and the name of the manufacturer.

(b) The tires shall also have marked, by stamping deeply into the steel tire channel, the tire serial number and a symbol representing the name of the manufacturer. The above data shall be stamped under the overhanging edge of the steel channel. In case of artillery tires they shall be marked according to blue print submitted.

(c) **PAINTING:** Paint metal bases with rust-resisting paint.

(d) **WRAPPING:** No wrapping required.

(e) **MARKING:** Shipping instructions to be shown on printed label pasted to inside of tire band and covered with a protective coating of silicate of soda over the label.

MATERIAL.

See General Specifications.

(a) **RUBBER COMPOUND:** The rubber compound shall contain not less than 65 per cent, by volume, of best quality new rubber. If reclaimed rubber or mineral rubber is used, it must be in addition to the 65 per cent of new rubber required, and the manufacturer must declare the amount and kind of reclaimed rubber or rubber substitutes used in his formula. The use of "refined" or ground vulcanized rubber in the compound will not be permitted. Compound shall be free from saponifiable oils or anything made therefrom.

(a) The total sulphur shall not be more than 8 per cent of the weight of the new rubber used, except as follows:

If the manufacturer desires to use sulphur-bearing fillers, thereby causing the total sulphur to be over 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

TESTS.

See General Specifications.

RUBBER COMPOUND: (a) **PHYSICAL—**

Specific Gravity.	1.40 or Over.	Below 1.40.
Tensile strength.....	1,800	2,000
Ultimate elongation.....	inches 1-1/2	1-1/2
Per cent set 2 minutes after breaking.....	40	40

Above placed on the average of not less than five samples.

(b) **AGING:** Prepare five flat samples of rubber to be tested; place in an oven for two hours at a temperature of 228 degrees F. After removing from the oven, allow to stand for 24 hours and determine elongation. The reduction in elongation at the breaking point shall be not over 35 per cent.

(c) **ADHESION:** The adhesion test shall be made as follows:

Place tire horizontally on platen of tire-applying press, the tire being supported above the lower platen of the press on a steel band having the same diameter as the base of the tire to be tested. Place on the upper side of the tread a band 1/2-inch thick with inside diameter 1 1/2 inches larger than outside diameter of flange of base band. The corners of the band to be rounded with 1/4-inch radius. For the tire to pass successfully the hard rubber must not break loose from the base.

In making ring-adhesion tests of solid rubber tires the applied pressure on a 36-inch tire should be 17 tons and on a 40-inch tire 19 tons. The pressure used on tires of other diameters should be in proportion to these pressures.

Standardization of minimum sectional areas, hard base pressed on solid rubber truck tires. The following standard of minimum areas is adopted for the various widths of solid rubber tires:

Inches.	Square Inches.
3 1/2	6.75
4	7.75
5	10.75
6	13.75
7	16.75
8	19.75
10	25.75
12	31.75
14	38.75

The areas hereinabove given refer to the sectional areas, including both the hard and soft rubber of finished tires, on standard base bands.

(d) **REBOUND.** The rebound shall not be less than 50 as measured on a Whitney rebound instrument. The tire under test shall be held at 70 degrees F. for a period of 24 hours before testing and the instrument shall be mounted rigidly in a vertical position. The tire shall be hung on a solid anvil below the instrument.

(e) **ROAD TEST.** Manufacturer shall maintain at least one truck, used exclusively for test work, which shall average at least 500 truck miles per week, and a sufficient number of tires, at least four, have averaged on rear wheels, at least 7,000 miles. Test on tire of 5-inch cross-section size, or larger, will be considered as representative of all solid tire cross-section sizes.

INSPECTION.

See General Specifications.

One tire in each lot of 500 (the tire to be selected at random by the inspector) shall be tested, and if the tire fulfills all the requirements of the specifications, the lot of tires represented by it will be accepted, including the tire on which tests have been made. Failure to conform to the specifications in any particular, the lot of tires represented by it, including the tire on which tests have been made, will be rejected. If, however, the maker of the tires demands a further test, three more tires from the lot rejected will be selected by the inspector, and if all tires are found satisfactory, the lot of tires represented by the tires subjected to test will be accepted, the manufacturer to bear the cost of the tires upon which tests have been conducted. If any tire fails in the latter tests, the whole lot will be rejected.

CLINCHER BICYCLE TIRES.

No. GS 1060	Minimum.
No. GS 1061	26 by 1 1/2 inches.
	28 by 1 1/2 inches.

GENERAL.

(a) This specification covers the requirements for bicycle pneumatic castings of fabric construction of the sizes 28 by 1 1/2 inches and 28 by 1 1/4 inches. They shall be of the manufacturers' standard, nonskid, double clincher type and satisfactorily fit, the standard 28 by 1 1/2 inch single clinch all steel bicycle rim.

(b) See General Specifications for Tires¹ which are a part hereof.

CONSTRUCTION.

See General Specifications.

(a) Carcass of the casing shall consist of two plies of fabric frictioned both sides.

(b) The tread of the casing shall not be less than 0.120-inch thick and the side wall not less than 0.032-inch thick when measured on the cured casing.

MARKING, WRAPPING AND PACKING.

See General Specifications.

MATERIAL.

(a) Fabric shall be square-woven (26 by 26).

RUBBER COMPOUNDS:		New Rubber, Per Cent. Volume.
Tread.....	minimum	55
Side wall.....	do	55
Friction.....	do	65

TESTS.

(a) **MEASUREMENTS:** The cross-section of diameter of each tire inflated to 40 pounds shall not be less than 1-29/64 inches in 28 by 1 1/2 inches and 1-37/64 inches in 28 by 1 1/4 inches.

(b) **FABRIC** shall have a tensile strength for each warp and filling of not less than 110 pounds per inch or its physical equivalent or colds as approved.

(c) **FRICTION:** Friction between piles of fabric shall average not less than 10 pounds and between tread and plies or between side wall and plies shall average not less than 9 pounds.

(d) **RUBBER COMPOUND:**

	Tread.	Side Wall.
Tensile strength.....	Minimum. 1,600	1,200
Ultimate elongation.....	2-10	2-10
Set.....		
Stretch.....inches	2-10	2-10
Set.....per cent	25	25

INSPECTION.

See General Specifications.

¹The General Specifications referred to in these specifications were published on page 351, in THE INDIA RUBBER WORLD, March 1, 1920.

PNEUMATIC MOTORCYCLE CASINGS.

No. GS 1065	Minimum.
No. GS 1066	28 by 3 inches.
	29 by 3 1/2 inches.

GENERAL.

(a) This specification covers requirements for pneumatic motorcycle casings of fabric construction. Size 28 by 3 inches shall be designed to carry a load of 325 pounds when inflated to 40 pounds per square inch; size 29 by 3 1/2 inches, a load of 400 pounds when inflated to 45 pounds per square inch; both designed for S.A.E. clincher motorcycle C.C. rim 28 by 3 inches.

(b) See General Specifications for tires which are a part hereof.

CONSTRUCTION.

See General Specifications.

(a) **SPICES** on the first ply of fabric shall be gum stripped. (b) **CARCASS** of casing shall consist of four separate plies of tire fabric, with friction coat on two sides and skim coat on one side. The gage of one ply frictioned on two sides and skim

coated on one shall be at least 0.043 inch. Each ply shall have not more than two splices which must be at least seven inches apart, and the splices in the casing shall be at least three inches apart; all measurements on the circumference of the casing.

(c) BEADS shall be constructed with a core filler as in standard commercial practice.

(d) Size 29 by 3½ inches shall have one chafing strip of square-woven fabric weighing not less than 8 ounces per square yard on each side of the casing and shall extend upward on the side of the casing at least ¾ inch from the channel of the bead.

(e) There shall be a cushion of rubber compound applied over the fabric which shall be wider than the breaker. The minimum gage of this cushion shall be 0.0325 inch for size 28 by 3 inches; and 0.045 inch for size 29 by 3½ inches.

(f) Over the cushion there shall be at least one breaker strip of open-weave fabric made from long staple cotton weighing not less than 8 ounces per square yard, as used in standard commercial practice, coated on both sides with a rubber compound which shall insure a perfect union between the cushion and tread, after cure.

BREAKER STRIP for size 28 by 3 inches, minimum width, 1½ inches.

BREAKER STRIP for size 29 by 3½ inches, minimum width 2½ inches.

(g) RUBBER DIMENSIONS

Size inches	28 by 3	29 by 3½
Thickness:			
Tread of casing in center	1/16	1/8
Tread, exclusive of non-skid portion in center	1/16	1/8
Side wall	0.045	0.050

(h) Flap shall be cemented inside of casing.

MARKING, WRAPPING AND PACKING.

See General Specifications.

MATERIAL.

See General Specifications.

(a) FABRIC must be square woven 23 by 23 from Egyptian long-staple cotton, or its physical equivalent as approved by the Government, weighing 17½ ounces to the square yard.

(b) RUBBER COMPOUND:

	New rubber, per cent volume.	Reclaimed rubber, per cent weight.
Tread	65
Side wall	65	15
Friction	75
Cushion	75

TESTS.

See General Specifications.

(a) Cross sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be for 28 by 3 inches, minimum 2-15/16 inches, maximum 3-3/10 inches, and for 29 by 3½ inches, minimum 3-7/16 inches.

(b) Shall withstand water pressure without injury, as follows:

Size	Minimum pressure
28 by 3 inches	250 pounds
29 by 3½ inches	275 pounds

(c) FABRIC: Tensile strength, warp or filling, minimum, 165 pounds.

(d) FRICTION:	Point B
Strength of union between plies of fabric minimum 16
Strength of union between breaker and tread minimum 28
Strength of union between breaker and cushion minimum 28
Strength of union between cushion and carcass minimum 16
Strength of union between side wall and carcass minimum 10

(e) RUBBER COMPOUND:

	Tread.	Side wall.
Tensile strength, minimum	2,200	1,500
Ultimate elongation, minimum, inches	2-11	2-11
Set
Stretch, minimum	2-10	2-10
Set	25	25

(f) ROAD TESTS:

Manufacturer shall maintain at least one motorcycle used exclusively for test work which shall average at least 1,000 machine miles per machine per week, and a sufficient number of casings (not less than six) shall have averaged on the rear wheels at least 4,000 miles.

INSPECTION.

See General Specifications.

AUTOMOBILE TIRE ACCESSORIES.

See General Specifications for Tires, which are part hereof.

GS 1070—Blow-out Patches.

They are recommended only for emergency repairs. A vulcanized repair should be made as soon as possible.

Patches shall be made at least six-ply 7-ounce fabric, or its equivalent, as approved by the Government. Pliers must be properly stepped down, according to good commercial practice. Two cars are approved on all patches. The length of the patch must be according to the manufacturer's standard commercial practice. The 3-inch and 3½-inch must be designed for use with clincher fabric tires and the 4-inch, 4½-inch, and 5-inch must be of ample size for use with cord tires.

GS 1071—Cementless Patches.

They shall be of one standard size, 1½ inches in diameter. The gage and compound of the stock shall comply with the specification for cured back tube stock as given in the Repair Material Specification. Patches molded to a featheredge are preferred.

GS 1072—Re liners.

They are recommended only in case of extreme necessity. All sizes up to 4-inch shall be made of at least three plies, while 4-inch and larger must be made of at least four plies of 7-ounce fabric, or its equivalent, as approved by the Government. The plies shall be built up on the bias, and a lap of at least 6 inches is required and the edges properly stepped off on the sides and skived on the ends to insure against injury to the tube. Each size reliner must be designed so that its width will be such as to properly fit the standard tire of that size. This includes 3-inch and 3½-inch in fabric clincher and 4-inch or larger in cord tires. The edge must stop approximately ¾-inch above the toe of the bead.

GS 1073—Flaps.

Motorcycle flaps must be of the cemented-in type and equal in construction and quality to the flap supplied by the bidder on tires made to Government specifications.

Straight side-cord tire flaps must be of the floating type and equal in construction and quality to the flap supplied by the bidder on tires made to Government specifications.

GS 1074—Fabric Cord Patches.

These patches must be made according to the manufacturer's standard practice from carded Egyptian, combed peeler cotton fabric, or their physical equivalent, as approved by Government, weighing not less than 13 ounces nor more than 16 ounces per square yard.

The plies must be laid on the bias, frictioned or spread and skim-coated on both sides, equally to a minimum gage of 0.043-inch. The compound must fill the specification set forth in the repair material specifications covering friction, skim, cushion, and tube stocks.

All sizes up to 6-inch shall be four plies and 6-inch and above shall be six plies. The patch must be properly stepped down and preference will be given to gum-stripped ends to insure against injury to the tube. There shall be applied in the center of the back of the patch a padding not less than 1/16-inch thick. The minimum length and breadth of the padding shall not be less than the length of pad specified below.

The following sizes are standard and lengths required are given in table:

	Patch, length, inches.	Length of pad, inches.
No. GS 1074X1—3½ and 4 inch	10	4
No. GS 1074X2—4½ and 5 inch	11	5
No. GS 1074X3, 6 inch	12	6
No. GS 1074X4, 7 inch	13	7
No. GS 1074X5, 8 inch	14	8

The General Specifications referred to in these specifications were published on page 351, in THE INDIA RUBBER WORLD, March 1, 1919.

VALVE ACCESSORIES.

No. GS 1080X1.

Valves: Schrader's 1936 or approved equivalent for motorcycle tubes.

No. GS 1080X2.

Schrader's 725 or approved equivalent for 3½ and 4-inch auto tubes.

No. GS 1080X3.

Schrader's 792 or approved equivalent for 4½ and 5-inch auto tubes.

No. GS 1080X4.

Schrader's 2033 or approved equivalent for 6-inch tubes and larger.

No. GS 1081X1.

Valve caps: Schrader's 880 or approved equivalent.

No. GS 1082X1.

Valve insides: Schrader's 1801 or approved equivalent.

GS 1083X1.

Tire gage: Schrader's straight Universal gage or approved equivalent for small cars or motorcycles.

GS 1083X1.

Schrader's right angle gage or approved equivalent for large cars and pneumatic tire trucks.

GS 1084X1.

Pump connection: Schrader's Universal No. 2238 or approved equivalent.

GS 1085X1.

Deflating caps: Schrader's No. 1886 or approved equivalent.

GS 1086X1.

Valve repair tool: Schrader's No. 2395 or approved equivalent. The power to approve equivalents is vested only in the Government.

REPAIR KITS.

GS 1090.

Repair kits shall be made up with the following material, packed in a round cardboard carton with tin ends and cover, approximately 2½ inches in diameter and 2½ inches deep. It shall contain:

Six cementless patches.

Strip of cured back tube gum 2 by 8 inches.

Tube of cement 2½ by ½-inch diameter, or equivalent.

Piece of sandpaper 2 by 8 inches, or equivalent.

Two valve insides, Schrader's 1801 (GS 1082X1), or approved equivalent.

Two valve caps, Schrader's 880 (GS 1081X1), or approved equivalent.

Carton to be labeled as follows:

WAR DEPARTMENT STANDARD INNER TUBE REPAIR KIT.

DIRECTIONS.

For Temporary Tube Repairs.

For repairing small punctures use "Cementless Patches." Roughen the tube with sandpaper, then apply cement and allow to dry. Remove cloth from patch and apply. Tube can be used at once.

For repairing blowouts use combination repair stock. Roughen tube around cut with sandpaper, then apply coat of cement around cut inside and outside of tube. Allow to dry. Cut piece combination stock ¼-inch larger in all dimensions than cut and place inside of tube, bringing edges of cut together over center of stock. Apply another coat of cement outside of tube and allow to dry. Cut and place same size piece of combination stock on outside of tube over center of blowout. Tube can be used immediately.

Note: Always remove cloth from patch and combination stock before applying and place cloth side next to tube.

REPAIR MATERIAL FOR PNEUMATIC TIRES.

See General Specifications for Tires¹, which are a part hereof.

GS 1091.

FABRICS (ONLY FOUR TYPES NECESSARY).

GS 1091X1.

SQUARE-WOVEN BUILDING FABRIC: This fabric shall be 17½ ounces per square yard with an allowable variation of 3 per cent plus or minus. It shall be 23 by 23 weave. The fabric shall be made from long-staple cotton with a tensile strength for each warp and filling of at least 150 pounds per inch. Methods of testing to be the same as specified in the fabric casing specifications. The fabric shall be frictioned both sides and skim-coated one side to a minimum gage of 0.047-inch.

GS 1091X2.

CORD BUILDER FABRIC: This fabric shall be made from long-staple carded Egyptian or combed peeler cotton, or their physical equivalent, as approved by the Government, weighing not less than 13 nor more than 16 ounces per square yard. The cord fabric shall be frictioned or spread both sides and skim-coated equally on both sides to a gage of 0.050-inch.

GS 1091X3.

BEAD FABRIC, SQUARE WOVEN:—This fabric shall weigh at least 8 ounces per square yard. It shall be made from long-staple cotton and shall be frictioned both sides.

GS 1091X4.

BREAKER FABRIC:—This breaker shall be an open-weave fabric of at least 10 ounces per square yard. It shall be made from

long-staple cotton. It shall be frictioned or spread and also skim-coated equally on both sides. The minimum gage shall be 0.070-inch.

GS 1092.

COMPOUNDS (ONLY THREE STOCKS NECESSARY).

GS 1092X1.

FRICTION, SEAM, CUSHION, AND TUBE REPAIR STOCK: (a) Specific gravity not to be over 1.30. These shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of new rubber.

(b) Two tread stocks shall be used. There shall be a black stock of specific gravity not over 1.60 and a white or grey stock of specific gravity not over 1.90. The treads shall be made from and have the characteristics of a compound containing at least 50 per cent by volume of new rubber. The kind and quality of the reclaimed rubber must be declared when used. The tensile strength of a properly cured tread sample shall be 2,000 pounds per square inch, with a minimum elongation of 400 per cent (2 to 10 inches). The permanent set shall not exceed 30 per cent after an elongation of 350 per cent (2 to 9 inches).

(c) Side wall stocks. Use tread stock.

(d) Retread semi-cured bands. Use repair tread stock specifications.

(e) Cured-back tube stock. The uncured stocks used must fill the specifications for the friction coat and cushion stocks.

The gage of the raw gum shall be not less than 0.015.

The gage of the cured gum shall be not less than 0.032.

GS 1093.

CEMENTS (TWO CEMENTS ONLY).

GS 1093X1.

(a) Vulcanizing cement shall be made from a compound having a maximum specific gravity of 1.15 containing at least 75 per cent by volume of new rubber. It shall be dissolved in benzol. The rubber compound content by weight to be determined by evaporation and milled to constant weight, shall be not less than 17 per cent of the total weight of the cement.

GS 1093X2.

(b) Acid cure cement: This cement to be made from new rubber with no other ingredients than a benzol solvent. The pure rubber content weight to be determined by evaporation and milled to a constant weight, shall be not less than 6 per cent of the total weight of the cement. The acid solution used with this cement shall be 2 per cent monochloride of sulphur and 98 per cent benzol.

CURE.

The base cure on a 4-inch section for repair material should be based on 45 minutes at 50 pounds steam pressure, it being understood that cure is to be made under proper conditions.

VALVE BASES.

GS 1094.

Two sizes designated as large and small will be required. The standard commercial, after sample bases have been submitted to and approved by the Government, will be accepted.

AIR BAGS.

GS 1095.

The air bags shall be made according to the standard practice and design of the manufacturer. A sample section of the bag showing the end reinforcement and cross section of the bag must be submitted to the Government for approval. Bags must be tested with 100 pounds air pressure and show no leaks when immersed in water.

PRICES.

Repair materials will be purchased on a pound basis. For comparison of different quotations the specific gravity and price on the basis of volume must be submitted by the bidder in addition to the price on a weight basis, it being understood that the volume price shall be the price per square yard of the gage specified in the request for bid.

THE LANGEN (Java) RUBBER ESTATES CO., LIMITED, reports that of its 4,427 acres, 2,377 are planted with *Hevea* rubber and of these 1,979 acres are being tapped. The rubber yield for the fiscal year, closing with the end of August, 1919, was 700,222; the average net sale price was 1s. 9.1d. per pound, the cost of production, f.o.b. at port of shipment was 11.43d. per pound. The estimated crop for 1919-1920 is 850,000 pounds. The net profits were £28,297.

¹The General Specifications referred to in these specifications were published on page 351, in THE INDIA RUBBER WORLD, March 1, 1920.

Life on a Sumatra Rubber Plantation.

THE FASCINATION which the strange lands of the Far East have held for the average American is taking on a more tangible form, now that travel and business are bringing Asia and the United States into closer contact. No article of commerce is doing more to bring this country into close touch with the mystic East than rubber. The rapid rise of the islands of the Indian Ocean to supremacy in crude rubber production, combined with the fact that America consumes nearly three-quarters of all the rubber grown there, has given many Americans an opportunity to look behind the scenes and become acquainted with the lands and peoples of that distant quarter of the globe.

Although the whole equatorial belt in that section is dotted with rubber plantations, representing a capital investment of nearly half a billion dollars, the thoughts of Americans naturally center on Sumatra, where one of America's greatest corporations has established a plantation so vast in area and so highly developed that it stands out as the greatest single plantation in

one gets used to that, so much so that a cool breeze is uncomfortable and causes more worry about the occasional cool spots in the weather than about the heat. The perspiration flows so freely that colds must be guarded against, and after any violent exercise a sweater should be put on to avoid taking cold.

The next thing that attracts the attention of the newcomer is the density of the vegetation. The forests in the United States have open spaces among the trees, but in Sumatra the trees are covered with parasites and vines forming a solid wall, while the ground is covered with a mass of undergrowth. This super-luxuriant vegetation is one of the chief foes of the rubber plantations, making constant weeding a necessity. On the other hand, the fertility of the soil and the hot, moist climate which produce the heavy vegetation, work wonders for the rubber trees.

The company has gone a long way to make the Americans and Europeans on its plantations comfortable. There is quite a little social life, centering in a club house. There are balls and

(United States Rubber Co.)

ONE-STORY BUNGALOWS, CENTRAL PARK, BOENET, SUMATRA.

the world. This is the plantation of the United States Rubber Co., comprising seventy square miles of growing trees, an enterprise marked throughout by a magnitude and an efficiency worthy of the best American traditions.

Many young Americans, alive with the spirit of adventure, have wondered what opportunities this plantation field might hold for a youth in search of opportunity. Inquiries of this sort are constantly being received by the plantation executives. To all such, the company invariably replies that without technical training in rubber chemistry, soil chemistry or horticulture, there is almost no chance of getting a foothold. One of the requirements is that a man going there must be prepared to settle down with the idea of making his permanent home there.

The executive and technical staffs of the plantation are made up largely of Americans and Europeans, therefore the following description of the conditions in Sumatra is interesting and timely.

The first thing that strikes the American making his first visit to Sumatra is the intense humidity. The temperature does not get as high there as it does on our hottest days here, but for several weeks the humidity seems very oppressive. After a time

entertainments, and occasionally there will be a visit from a traveling theatrical or concert troupe.

There are a number of large houses of comfortable proportions for company officials and their families, and many one-story bungalows. The houses have to be built with regard for the sun and rain. A large part of the home life is spent on the veranda, and this part of each house is usually large and commodious. Glass windows are unknown—each window is really a slatted shutter. Circulation of the air must be free at all times, as a room closed for a few minutes would become stifling.

Much of the pleasure in life in the East depends on the efficient management of the servants in one's employ. For this reason it is quite necessary to speak the Malay tongue. It is so easy to learn that anyone can get along well with it after a few weeks. But until it is acquired it is simpler to do some things yourself than to employ the sign language to order them done. When once the language is learned, life is worth living. A white man never carries a package or stoops to lift anything from the ground. When tennis is played there are always some boys about to pick up the balls.

The endeavor is to reproduce as nearly as possible the food

obtained at home. The native cooks get good results considering they don't have the American ingredients. But American women succeed admirably in adapting some of the tropical foods to the Yankee palate. The lack of raw vegetables is most felt. Because of the danger of diseases everything must be cooked.

It is necessary always to sleep in a bed protected by mosquito netting or in a room that is netted. The mosquitoes are countless and very troublesome. Of course, as in all tropical coun-

temperate zone to get acquainted with their home lands and for the educational facilities those lands afford.

Members of the white staff in Sumatra are in a fortunate position in one especial particular in that a few hours' motor ride into the interior will take them up on the plateau. This plateau, deeply cut by ravines and surrounded by mountains, has an elevation of 4,300 feet. Some of the mountains are volcanoes which are somewhat active occasionally, giving off fumes. At Bras Tagi the company has some bungalows where can be found recreation and rest from the humidity of the plains. Up there the vegetation is quite different. Some varieties of temperate zone vegetables and flowers grow, notably potatoes. The temperature goes as low as sixty at night and no higher than eighty-five in the day.

Altogether the life on the plantations is quite pleasant after becoming acclimated. But always, down deep in every American's mind is the thought of home, and his eyes are always turning back across the ocean toward home. Most of the Europeans

(United States Rubber Co.)

THE KISANAN CLUB HOUSE.

tries, the bugs of all sorts are numerous. One thing that always attracts the attention of newcomers is the little lizards that crawl on the walls and ceilings. They do no harm and one gets quickly used to them. The ladies take longer to get accustomed to them, however, than do the men.

When a woman accompanies her husband to the plantations she finds it more difficult to enjoy life than does her husband. He has his business to attend to and that keeps his mind occupied. But with the plenitude of servants the wife finds herself relieved entirely of housework and of the care of her children, if she desires, and she must be a person of resource if she is going to be happy. The woman who desires to create interest for herself can busy herself in her vegetable and flower gardens, in studying native life and in such sports as golf and tennis.

The servants are good and there are a lot of them. Each has his own work to do and does it, but he must not be asked to do anything out of his line. The cook is supposed to cook, and he

(United States Rubber Co.)

SERBANGAN JUNGLE LAND.

are Hollanders—Sumatra is a Dutch colony—and they seem to feel that in Sumatra they are on Dutch soil and consequently are more content than Americans to remain indefinitely on the island.

BOLIVIA STARTED PUBLIC AUTOMOBILE LINES LAST MAY, ONE from Sucre, the capital, to Cochabamba, another from Sucre to Potosi. Haiti, too, has established a postal automobile service between Port au Prince and Miragoane.

AT ST. VINCENT THE SEA ISLAND COTTON CROP FOR 1918-19 amounted to 436,980 pounds or 1,214 bales, of which 682 bales were exported by the end of June. From Montserrat 222 bales of cotton were shipped, comprising 142 bales of clean cotton and 80 bales of stained.

AZTECA, S. A., 29 REVILLAGIGEDO, MEXICO, HAS APPOINTED Severino Carrera Peña manager of the company, succeeding Ignacio Orozco, resigned. The officers are: Antonio Letavf, president; Rafael Orozco, treasurer; and Ricardo Ramos Barrera, secretary. The concern manufactures tires and rubber goods.

(United States Rubber Co.)

BUNGALOWS "AMERICA" AND "HOLLANDIA" ON THE PLATEAU.

feels badly treated if he is asked to do anything else. In a well-regulated home there are usually three to five servants.

The country is an ideal one in which to raise small children. They live in the open until they are six or seven years old and miss most of the children's diseases common in the United States. The native nurses are faithful and efficient and the little tots live an outdoor life untouched by trouble. When they are six or seven years old, however, most of them are taken away to the

Colors and Pigments in Rubber Compounds.

By Calvin Stitt.

THE USE of pigments and colors in the manufacture of rubber goods is of extreme importance and it may be said that the employment of these materials is of more consequence now than ever before. To anyone who has had the opportunity to note the various compounds that are being used at different rubber factories and to see the unlike purposes for which in many cases the same material is used, the results obtained are remarkable.

Sometimes a chemist will find that a special pigment will work out nicely while another chemist will condemn its use. In the main, it will be found that most rubbermakers use formulas that are similar in many respects. I do not think they approach any more nearness than this, surely they are far from being identical. The cause lies mainly in the employment of the so-called human element. It naturally follows that no two products of two different rubber factories are the same, as long as they are made by different chemists who employ their own compounds. In this case I mean the finished product naturally is not identical, such as two tires.

By means of certain pigments it is found that the rubber is toughened. Some other fillers add elasticity, etc. In the case of an automobile tire it is essential to have toughness and a certain elasticity as well. The reason why some tires wear out quicker than others is not always due to the fabrication or the cure. It is often caused by the compound not being of the proper proportion or containing pigments that harm rather than benefit the rubber. This condition will prevail as long as the rubbermaker neglects to standardize his ingredients and be sure that his raw materials are always as near alike as it is possible for him to make them.

The selection of colors is of paramount importance. We will disregard the aniline group and look into the pigments or dry colors, because these are the most used, except in the manufacture of balloons, toys and some rubber sundries and mechanical goods.

The blacks are usually a carbon black, lamp black or mineral black. In passing it may be well to note, that the advance in price on carbon black aside from war conditions, has been due largely to the enormous consumption by the rubber factories during the past four years.

It has not been found practical to use a cheap quality of carbon black, especially for tire treads and rubber sundries, but rather the higher grades. The higher percentage of black is more inert and is claimed to have no detrimental effects on the stock where used. A very small amount of strong carbon black will give a beautiful black color. Where an intense black is not desired the carbon black can be cut down considerably. Some chemists and experienced rubbermakers claim that this material adds strength and better wearing qualities to the rubber, while others claim it does not have this effect, and still others even go so far as to say that it is detrimental in some cases.

Perhaps the real truth may be that in one compound it works out very well while in another which contains other component parts and proportions, the result may be somewhat different. Carbon black may therefore be blamed for conditions for which its use is not responsible.

Lamp black is not as strong as carbon black and gives a bluish tone to the rubber. Some factories have a separate black room, and collect the dust by blowers, etc. Many rubber boot manufacturers use lamp black and find it very satisfactory. The mineral black pigments are not as strong as these other blacks. Some grades of mineral rubber are used in black stock also.

The reds are mostly the iron oxides, Indian red, antimony,

vermilion red, Pará red and toluidine red. The toluidine red and Pará red are vivid shades, and are made from intermediates, and really belong to the aniline group.

English vermilion is a mercury product and is also very vivid. It is employed extensively in dental rubber goods. It is not necessarily made in England as some suppose. The name merely implies the English process of manufacture. There are to-day in this country several large makers of it and their product is very satisfactory.

Antimony, both crimson and golden, is used extensively in tube stock, sometimes in connection with red oxide and sometimes alone. It is also used in the treads, boots, heels, etc. The best antimony comes from England, but due to the difficulties experienced in importing it, there has been a large consumption of the domestic grades.

Red oxides are usually sold on their percentage of iron oxide content. The greater percentage the higher the cost. Some are natural or earth colors, while some are manufactured, especially the higher grades. These higher grades are made from copperas or the by-product of wire mills. This country produces some excellent red oxide, but previous to the war most of the higher grades were imported from England.

Indian red is very closely allied to red oxide, and is used principally on account of its large covering capacity, and also on account of its beautiful color, it being more of a maroon, or purplish shade. The higher qualities of Indian reds are of extremely fine mesh, free from grit. It is interesting to note that on account of its softness and freedom from coarse particles, Indian red of the best quality will not scratch the surface of highly polished gold. For this reason, it is used extensively in jewelry factories, and there are many tons sold throughout the country for this purpose.

The yellow colors, such as zinc yellow, chrome yellow, etc., as well as the blue shades, like Malori, Chinese and Prussian blues, also the ultramarine blue, are used in a limited way. To one who understands the various shades and combinations that can be obtained by various mixtures of colors, the results are very interesting to follow out. Each color has an effect upon the fillers and pigments that are in the compound and is itself affected by the pressure and heat applied in the vulcanization, so that one has to know pretty certainly what he is doing in order to be sure of getting what he started out for. Even the most particular and experienced sometimes go wrong. There are so many things that creep in before the product is finally finished, that it makes it very hard sometimes to check out results in advance.

The white pigments and fillers are by far the most important and most largely used. Zinc oxide is the principal one. Some time ago, the writer suggested that certain grades of leaded zinc could be used in some compounds. Experiments were made along this line, and to-day there are several rubber manufacturers who are using leaded zinc. They all turn out a highly satisfactory article and, moreover, are saving money on their zinc. It is not necessary to use a zinc that is free from lead or even approximately lead free in all rubber goods. As previously stated, some rubber manufacturers use zincs that contain lead, and find that the finished product is satisfactory. This is especially true when the goods are not required to be white. Zinc oxides that are free from lead are best for white rubber, such as sheetings, some grades of automobile tires and druggists' sundries. The writer has found that some brands of zinc oxide cover better than others. The chemist has found that it is profitable to experiment along this line, in order to determine the most suitable zinc oxide to use in his compound.

Lithopone is used considerably in rubber, but its use is not as great as zinc oxide. Many chemists do not recommend its use at all, while others do. It is composed of about 29½ per cent zinc sulphide and 69½ per cent barium sulphate. This is the reason it is generally sold as 30 per cent. There is a vast difference in the physical properties of this pigment. It possesses very great covering power, and has a beautiful white color. It also has a peculiar tendency to darken in the light, but will, however, regain its original color. There has been no one who could satisfactorily understand this phenomena, although many have tried and as many different theories have resulted. At any rate, no one can control this change in lithopone or remedy it.

Whiting or calcium carbonate is quite an important white filler. It is inert and unaffected by vulcanization. Several grades are employed, both imported and domestic. The imported is the cliffstone or English chalk whiting, which is produced from the great chalk cliffs of England. The domestic products are of various qualities, and different colors, ranging from a brownish or yellow gray to a beautiful white.

Barium sulphate or barytes is generally of a white water-floated grade, although large amounts of off color barytes are consumed. The artificial barium sulphate or blanc fixe is not used in any appreciable quantities.

Soapstone and talc are used in certain compounds and in dusting tubes, tires and rubber goods generally. It is essential to get a product that is not gritty. Color does not make much difference.

It is extremely necessary that the quality of many of the pigments and colors that are put into compounds of rubber should be of a standard or recognized merit. Some sad experiences have taught many rubber mills this lesson, and it is becoming more apparent than ever, especially in view of the fact that so many new rubber manufacturers are starting up in all parts of the country. It is not always convenient or practical for rubber firms to test out every ingredient that they employ, and for that reason it is a good policy to direct their purchases in a direction where their needs are understood, and where the possibility of error is minimized.

A NEW RAPID METHOD FOR THE DETERMINATION OF SULPHUR IN RUBBER COMPOUNDS.

By A. M. Munro M.A., A.I.C., F.C.S.

THE ANALYTICAL METHODS for determining sulphur in manufactured rubber, in use at the present time, fall under two heads: (1) those in which the finely divided sample is fused with a suitable nitrate fusion mixture or with caustic potash and sodium peroxide; (2) those where the rubber is decomposed with fuming nitric acid and the sulphur completely oxidized by final treatment either by a fusion process or by partial evaporation of the residue with potassium chlorate and hydrochloric acid. In both these cases the sulphur is finally determined by precipitation with barium chloride.

In this laboratory it has been customary to determine sulphur by boiling the sample of rubber, cut into small pieces, with fuming nitric acid, evaporating nearly to dryness, adding about half a gram of potassium chlorate and a few cubic centimeters of strong hydrochloric acid, and again evaporating. If the sample showed incomplete decomposition the above process was repeated. The mixture was then diluted with boiling water, filtered, and the sulphate in the filtrate determined in the usual way as barium sulphate. This method gives very accurate results, is more speedy than the fusion methods, and is free from the danger of loss by spurring; a disadvantage almost inseparable from the latter methods.

In seeking a still faster method than the above for the rapid

assay of sulphur, the writer devised the following, and strongly recommends it as a routine method of analysis where extreme speed combined with accuracy is required. Many carefully timed tests have been made and it has been demonstrated that, with practice, the whole analysis from weighing the rubber sample to that of the precipitated barium sulphate can be carried out within one hour.

DETAILS OF THE METHOD.

One to one and a half grams of the sample, cut into small pieces are placed in a large Erlenmeyer flask and covered with about ten cubic centimetres of strong nitric acid. This acid must be pure and free from traces of sulphuric acid. To this about five grams of sodium peroxide are cautiously added in small portions at a time. The reaction is often violent and the rubber commences to decompose, but no loss need be feared if the reaction is conducted in a large conical flask. The action is completed by gently warming the mixture on a sand bath.

After the first action is over and the rubber is more or less broken up, a process occupying a few minutes only, the mixture is boiled on the sand bath almost to dryness. Boiling water is added and the liquid filtered through a fast filter paper; the paper is washed twice with boiling water and the washings added to the filtrate. The sulphate in the filtrate is then precipitated in the usual way with a boiling solution of barium chloride, and, after standing for a few minutes, filtered through an ashless, fast filter paper, made to retain barytes. The precipitate is washed once by decantation and then on the paper until free from chloride. The paper and its contents are then removed from the filter, dried rapidly on a piece of wire gauze supported in the open over an asbestos mat heated by a Bunsen burner.

The precipitate is detached as completely as possible from the dry paper which is ignited separately. After the crucible has cooled the precipitate of barium sulphate is transferred to it and the crucible and its contents are again ignited at dull red heat. About five minutes' heating is sufficient to bring the precipitate to constant weight.

OBSERVATIONS.

The success and speed of the method outlined above depends on the fact that the combined action of the hot nitric acid and the hydrogen peroxide in the solution brings about a very rapid decomposition of the rubber and completely oxidizes the sulphur. It is probable, too, that nascent oxygen is present in the mixture and that this has a powerful action on the sulphur. Any loss of sulphur in the form of fumes of sulphuric acid during the final stages of the evaporation is prevented by the presence of sodium salts which convert all the acid into sodium sulphate. The use of a conical flask of large size precludes any loss due to spurring when the peroxide is added. In the precipitation, speed is attained by keeping all the solutions at boiling temperature and using fast filter papers, and considerable time is saved by drying the paper and precipitate as described on a wire gauze.

VELOSAN ACCELERATOR.

The English vulcanization accelerator Velosan is now available on the American market and is certain to elicit much interest since adequate supplies of the popular hexamethylene tetramine are not at present available. Velosan has been familiar for the past four years to the rubber manufacturers of England. It is non-poisonous, free of objectionable odors, generates no extra heat and cures goods in one-half to one-fifth of the usual time required.

The quantity of Velosan to be used is one per cent of the crude rubber weight in the mixing. It is added to the batch from a sprinkling can or in a mixture with three or four times its bulk of dry ingredients. Care is necessary to insure its uniform distribution throughout the batch.

What the Rubber Chemists Are Doing.

THE DETERMINATION OF CELLULOSE IN RUBBER GOODS.¹

A PROPOSED METHOD for the determination of cellulose in rubber goods has been worked out by S. W. Epstein and R. L. Moore, assistant chemists of the Bureau of Standards.

The authors find that the method usually employed for the determination of the rubber content of mixing by difference will give worthless results whenever there are present ingredients which are driven off in the ashing or are not included in the other determinations. Unless these ingredients are determined separately the figure for rubber hydrocarbonation is necessarily erroneous. Free carbon², glue³, and cellulose are examples of such ingredients.

Rubber sheeting, raincoat materials, balloon fabrics, spread goods and frictioned fabrics are cited as rubber products which have cellulose impregnated with rubber in such a way that it cannot be separated from it. In addition there is the type of mixing which has fiber distributed throughout the compound, such as fiber soles, special light compounds, and special packings. In order to evaluate these products properly the fiber must be determined separately.

DETAILS OF METHOD.

After having considered the essentials of a procedure for the determination of cellulose in rubber goods, the following method was devised:

Digest 0.5-g. sample of rubber in a 250-cc. assay flask with 25 cc. of freshly distilled cresol (boiling point 198 degrees C.) for four hours at 160-185 degrees C. The digestion can be carried out on an electric hot-plate or better still in a constant temperature oven. Allow the cresol to cool completely and add 200 cc. of petroleum ether (boiling point 45-50 degrees C.) very slowly and with constant agitation. After the solution has settled completely and the supernatant liquid is perfectly clear, filter through a Gooch crucible containing a fairly thick pad of acid treated and ignited asbestos, and wash three times with petroleum ether. Wash at least five times with hot benzene and then once or twice with acetone. Treat the contents of the flask with hot 10 per cent solution of hydrochloric acid and transfer the entire contents of the flask to the Gooch crucible with the aid of a "policeman." Care must be taken in adding the first portion of acid to the Gooch since in the presence of carbonates the effervescence which ensues may cause some of the material to be lost. It is best to add the acid a few drops at a time until there is no more effervescence. Continue to treat with hot ten per cent solution of hydrochloric acid until the pad has been washed to least ten times. Wash the pad free from chlorides with boiling water and run small portions of acetone through it until the filtrate comes through colorless. Treat with a mixture of equal parts of acetone and carbon bisulphide until the solvent is no longer colored. Wash with alcohol and dry for one hour and thirty minutes at 105 degrees C. Remove the pad from the crucible with the help of a pair of sharp pointed tweezers and place it in a weighing bottle that is large enough to contain a 25-cc. Gooch crucible or the size crucible that is being used. Use the underneath portions of the pad as a swab to clean the sides of the crucible. If necessary moisten this asbestos with a little alcohol since this will facilitate the complete removal of material which sometimes adheres tenaciously. Place the weigh-

ing bottle and contents in the drying oven for about 15 minutes, cool and weigh. Call this weight *A*.

Transfer the contents of the weighing bottle to a 50-cc. beaker, taking precautions that no material is lost during the transfer or allowed to remain in the weighing bottle. Add 15 cc. of acetic anhydride and 0.5-cc. of concentrated sulphuric acid and allow to digest for 30 minutes at 75 degrees C. The steam bath can be conveniently used for this purpose. After the mixture has cooled completely dilute with 25 cc. of 90 per cent acetic acid and filter through a weighed Gooch containing a thick pad of properly prepared asbestos. To guard against traces of material being carried through it is absolutely essential that this filtration as well as the ones to follow be very slow and that only gentle suction be used. Wash with hot 90 per cent acetic acid until the filtrate comes through absolutely colorless and then wash at least four times more. Wash about five times with acetone. After having taken care that all of the material has been washed out of the beaker in which the acetylation took place, remove the crucible from the funnel, clean the outside thoroughly, place it inside of the same weighing bottle that was used to weigh the pad and dry for two hours at 140 degrees C. Cool and weigh. Call this weight *B*. Weight of Gooch crucible plus weight *A*, minus weight *B* equals loss due to acetylation or cellulose.

It is essential that all reagents given above be of chemically pure quality and be filtered before using.

When large numbers of determinations were carried out according to the above procedure, it was found practical to distill the filtrates and in this way recover a large part of the solvents used. The combined filtrates containing petroleum ether, benzene and cresol were distilled on the steam bath to recover the petroleum ether. The benzene was recovered as the temperature was raised. Finally the water condenser was replaced by an air condenser and the cresol distilled out at about 195-200 degrees C. This distillate was usually only slightly yellow.

Likewise the filtrates from the acetylation, which contain acetic anhydride, acetic acid and small quantities of sulphuric acid were collected and distilled. The distillate was collected between 105 and 115 degrees C. and was used for washing to take the place of the 90 per cent acetic acid called for in the proposed method.

RESULTS.

Results obtained by the analysis of a number of prepared stocks containing cellulose in the form of cotton fiber clearly indicated that by this method it is very easy to determine widely varying amounts of cotton fiber very accurately even when accompanied by a miscellaneous collection of mineral fillers in the rubber compound. Even in the presence of 15 per cent of carbon black it was possible to get good results on cellulose because the weighings were all made in weighing bottles and therefore no error was introduced by absorption of moisture by the large amount of carbon.

The presence of large quantities of cellulose in some reclaims necessitates looking for cellulose in finished rubber goods of grades in which reclaims may be expected.

The presence of considerable amounts of leather does not affect the determination of cellulose. In the cases of wood and jute, a comparatively accurate estimation of their quantity can be obtained by using a modified procedure, in which the temperature of 120 degrees is used in place of 185 degrees C. in order to dissolve the rubber.

CONCLUSIONS.

I. The method presented is readily applicable to the determination of fabric in rubber sheeting, raincoat materials, waterproofed fabrics, spread goods, frictioned and calendered fabrics in general. The results obtained by this method have been found

¹"Determination of Cellulose in Rubber Goods," by S. W. Epstein and R. L. Moore, Technologic Paper No. 154, Bureau of Standards, Washington, D. C.

²"Determination of Free Carbon in Rubber Goods," by A. H. Smith and S. W. Epstein, *The India Rubber World*, January 1, 1919, page 197.

³"Detection and Determination of Glue in Rubber Goods," by S. W. Epstein and W. E. Lange, *The India Rubber World*, January 1, 1920, page 216.

to be accurate by analysis of known compounds. The method has been shown to be useful in the detection and determination of cellulose in reclaiming.

II. The presence of leather in mixings does not interfere with determination of cellulose.

III. In the analysis of light, cheap compounds such as rubber soles where wood, jute, cork and leather may be present, it is desirable to digest sample at 120 degrees C. in cresol for 16 hours, in order to keep these fibers intact. Acetylation obtains 95 per cent of the total wood; 90 per cent of the total jute; 21 per cent of the total cork, and 70 per cent of the leather.

IV. The amount of cork present in a mixing can be approximated by removing unacetylated cork residue and considering this as 70 per cent of the total.

V. In the absence of jute, wood and cork, it is shown that the amount of leather may be estimated approximately.

VI. The problem of separately determining wood, jute and leather in a mixing has not been solved.

DETERMINATION OF NITROGEN IN CRUDE RUBBER.

The exact nature of the nitrogen compounds in crude rubber has not yet been determined, but the assumption that they may be converted into ammonia has been demonstrated by Howie who has adopted Wilfarth's modification of anhydrous copper sulphate to the Kjeldahl method.

It is generally considered that the final stage in the digestion with sulphuric acid is reached when the solution becomes clear. Actually it is necessary not that the solution be clear but to completely change the nitrogen compounds present into ammonia. Because of the large proportion of hydrocarbons in caoutchouc, at least six hours are necessary to produce a clear solution.

To determine if this period can be shortened and still have a complete change of the nitrogen to ammonia, the following experiments were carried out. In each instance one gram of caoutchouc was digested with 30 cc. of sulphuric acid, seven grams of potassium sulphate, and about one gram of anhydrous copper sulphate. Identical samples were heated, respectively, for one, two, three, four, five and six hours, after which the percentages of nitrogen were determined in the ordinary way. The sample heated for six hours was the only one clear, but was colored. The others all contained more or less carbon in suspension.

The analytic results showed that it is unnecessary, at least for caoutchouc, that a clear solution be obtained and that from three to four hours is ample for obtaining the total nitrogen present. ("Le Caoutchouc et la Gutta Percha.")

THE CONSTITUTION OF VULCANIZED RUBBER.

W. C. Schmitz summarizes as follows his investigations and contribution to the knowledge of the constitution of rubber by means of bromination, which appears in "Gummi-Zeitung," volume 34, No. 10, page 193.

The impression that the bromine method would enlarge our insight into the problem of vulcanization has been confirmed to some extent and further results may be anticipated.

The author's investigation has shown that the bromine absorption is purely additive, there being no substitution. The reaction proceeds in two stages when continued for 18 to 20 hours, ten atmospheres of bromine being absorbed by the caoutchouc molecule in the first stage, two molecules of hydrogen bromide being afterwards liberated. The residue tetrabromide differs from the known caoutchouc tetrabromide by being insoluble in carbon tetrachloride. Full details of the method are given and the same reagent is being applied in the study of vulcanized rubber. The questions so far clearly defined in the latter connection are as follows:

1. Is vulcanization a purely additive combination of rubber with a sulphur combination?

2. Is the sulphur combination the result of substitution?
3. Is the purely colloidal explanation of the sulphur combination adequate, or are stoichiometric laws and colloidal factors involved?
4. Are the improved physical qualities of vulcanized rubber the result of pure chemical process?

SYNTHETIC RUBBER FROM PETROLEUM.

Synthetic rubber from petroleum, and the process for making it, as described in a treatise by Professor Ossian Aschan, of the University of Helsingfors, are discussed by Giuseppe Bruni, of the Pirelli laboratory at Milan, in a recent issue of the "Giornale di Chimica Industriale."

The Italian chemist concedes that the method may be employed with success for commercial quantities as well as in the laboratory. Though not wholly certain of this, he demonstrates that even with a material as common as Russian petroleum to draw upon, the cost of production would be prohibitive. It seems hopeless that synthetic rubber from any source can compete with natural rubber while the latter can be produced at a profit at the prices now prevailing.

ACTION OF PHENOL IN RECLAIMING.

André Dubosc, in "Le Caoutchouc et la Gutta Percha," July 15, 1919, states that a better quality of reclaimed rubber is obtained by phenol than by the alkali process. The action is explained in two ways: (1) depolymerization of the rubber molecule; (2) formation of phenolic ethers or sulphides such as phenyl sulphide or thiophenol, the heat of the formation of which is greater than that of vulcanized rubber. Either water or alkaline solutions of phenol are used.

CHEMICAL PATENTS. THE UNITED STATES.

FLEXIBLE HEAT-RESISTING COMPOSITION. An inflatable expandable core tube for use in the curing of sulphurized rubber tires is formed of rubber mixed with tellurium or selenium which gives the material great durability when subjected to repeated heating. (H. E. Smith, United States patent No. 1,322,734.)

HEAT RESISTING PACKING consisting of vulcanized rubber compound having magnesite in a state of fine subdivision incorporated and distributed therein. (Julius Stromeyer, Philadelphia, Pennsylvania United States patent No. 1,330,148.)

PACKING. A molded and vulcanized piston packing ring comprising in its composition rubber, sulphur and ground sponge. (George Christensen, Jamaica, assignor to H. W. Johns-Manville Co., New York City, both in New York. United States patent No. 1,330,979.)

DOPE OR SUBSTITUTE FOR CELLULOSE, VULCANITE, ETC. A plastic composition comprising a phenol-formaldehyde condensation product, camphene and a cellulose derivative. (William Thomas Robinson-Bindley, Wimbledon, and Arthur William Weller, both of London, England. United States patent No. 1,331,127.)

COMPOSITION FOR USE AS A SUBSTITUTE FOR LEATHER. A dense non-elastical composition of matter comprising rubber, finely ground sponge and a considerable proportion of inert filler intimately mixed together. (George Christensen, Jamaica, N. Y., assignor to H. W. Johns-Manville Co., New York. United States patent No. 1,332,320.)

PROCESS FOR TREATING LATEX AND PRODUCT OBTAINED BY coagulating rubber producing and similar latex, restraining the expansion of the latex during coagulation in the absence of applied fluid pressure, whereby the latex will be subjected to a gradually increasing pressure during its coagulation, and adding a vulcanizing agent thereto. (Edward Mark Slocum, Medan, Sumatra, Dutch East Indies, assignor to General Rubber Co., New York City. United States patent No. 1,332,925.)

RUBBER COMPOSITION AND PROCESS FOR THE PRODUCTION thereof, comprising an admixture of a vulcanizable plastic and rubber seed pulp. (Edward Mark Slocum, Medan, Sumatra, Dutch East Indies, assignor to General Rubber Co., New York City. United States patent No. 1,332,926.)

THE DOMINION OF CANADA.

RUBBER TREATING PROCESS. Consisting in reducing waste vulcanized rubber to a finely divided state; adding a small quantity of new unvulcanized rubber in sufficiently dilute solution to produce a very thin film over the vulcanized ground waste; driving off the solvent and forming and vulcanizing the mixture in the usual manner. (The City Trust Co., assignee of Joseph Porzel, both of Buffalo, N. Y., U. S. A. Canadian patent No. 196,948.)

WATERPROOFING COMPOSITION Consisting of paraffine wax, dissolved rubber, a resinous substance dissolved in alcohol, a light hydrocarbon oil and carbon bisulphide. (The Gary Waterproofing Corp., Chicago, Illinois, assignee of Guy Madison Garlick, Kalamazoo, Michigan, U. S. A. Canadian patent No. 197,340.)

WATERPROOFING PROCESS, which comprises heating a mixture of melted wax, resinous substance and dissolved rubber to 305 degrees F., and at varying specified suitable intermediate temperatures adding a resinous substance dissolved in alcohol, light hydrocarbon oil, and carbon bisulphide. (The Gary Waterproofing Corp., Chicago, Illinois, assignee of Guy Madison Garlick, Kalamazoo, Michigan, both in U. S. A. Canadian patent No. 197,341.)

THE UNITED KINGDOM.

LEATHER COMPOSITIONS for making boot soles, coating canvas for printers' blankets, upholstery, etc. The following proportions by weight may be used: 16 rubber, 20 leather flour, 5 caustic magnesia, 3 sulphur, 3 brown facie, or for a hard vulcanite material, 32 rubber, 60 leather flour, 16 sulphur and $\frac{1}{2}$ magnesia. After mixing, the temperature of the rolls is raised to effect partial vulcanization and the material is finally passed to calendar rolls prior to complete vulcanization in a platen press or an open live-steam press. (W. Drury, 10 Lena Gardens, Shepherds Bush, London. British patent No. 135,921.)

VULCANIZING RUBBER. Nitrosobenzene or a similarly constituted nitroso-hydrocarbon of the cyclic series is used as an accelerator in the vulcanization of rubber. As an example, 100 parts of rubber are mixed with ten parts of sulphur and 0.5 parts of accelerator. (S. J. Peachey, 5 Yew Tree Road, Davenport, Stockport, England. British patent No. 136,716.)

RUBBER PAVING SLABS OR TILES are formed with a wearing surface of soft rubber composition and a foundation of hard rubber composition. The tiles may comprise a plurality of layers varying in hardness from top to bottom, and the bottom layers may be formed wholly or mainly from ground waste rubber. As an example the bottom layer may be formed from a mixture of five parts of ground rubber waste with two parts of sulphur, and the top layer of ground rubber alone. (Grimston Tyres, Limited, The Camp, St. Albans, Hertfordshire, and J. F. Cooper, Ivy Cottage, Port Vale, Hertford, both in England. British patent No. 137,112.)

THE FRENCH REPUBLIC.

SUBSTITUTE FOR RUBBER (V. A. Rosa. (French patent 498,071.)

PROCESS FOR RECLAIMING BENZINE OR OTHER SOLVENTS employed in the rubber industry. (Société Anonyme des Anciens Etablissements. J. B. Torrilhon. French patent No. 498,464.)

GERMANY.

PROCESS FOR REGENERATING RUBBER SCRAP. The material is heated with water under a pressure of 200–600 atmospheres

at 210 degrees C., and in presence of alkaline substances such as caustic soda. Free and also combined sulphur as well as organic and inorganic filling materials are more completely removed than by existing processes, and the rubber is not affected. (W. North and H. Loosli, Hanover. German patent No. 313,554.)

PRODUCTION OF HIGHLY ELASTIC VULCANIZATES FROM SYNTHETIC RUBBER. Middle tar oil is incorporated with synthetic rubber prior to vulcanization, and imparts a high degree of elasticity to the final product. From three to five times the proportion of the customary "elasticators" is easily incorporated, the saturation limit being 150–200 per cent. (Mitteldeutsche Gummiwarenfabrik, L. Peter, Frankfurt. German patent No. 315,321.)

PROCESS TO COAGULATE RUBBER LATEX. (Francis Alban Byrne, Birmingham, England. German patent No. 320,170.)

A new form of absorption bottle described as "a V-tube passed through the fourth dimension" is here illustrated. This apparatus has the same absorption qualities as the U-tube. The

A RAPID ABSORPTION BOTTLE.

where dry reagents are used and has proved of particular value in rapid organic work. One turn shuts off inlet and outlet and also chamber A from B. It is easily cleaned and cleaned; is small, compact, light in weight, and stands solidly on the balance pan. (Eimer & Amend, 211 Third avenue, New York City.)

THE BUREAU OF STANDARDS IS ENGAGED IN THE EXTENSIVE project of developing standard specifications for all classes and types of rubber goods. Specifications for pneumatic tires and cotton jacket fire hose have already been submitted to the trade for suggestions. Work on surgical goods, tubing, rubber stoppers, etc., is under way.

New Machines and Appliances.

RUBBER BAND CUTTING MACHINE.

JUST HOW MANY POUNDS of stationer's rubber bands are manufactured yearly in the United States is a matter for conjecture; however, the figures must certainly be in millions of pounds. A primary factor in the quantity production of this ubiquitous article is the band cutter shown in the accompanying illustration. It will cut bands in standard widths from 1/32-inch to 3 inches and in length up to 13 inches.

THE CRUICKSHANK BAND CUTTER.

The operation is as follows: The circular strips or tubes are fed in the machine and over the apron, and are flattened out by a roller located just in front of the three revolving knives which come successively in contact with a stationary knife.

If short bands are required, as many as five or six strips may be run through at once, producing from 1,800 to 2,800 bands per minute. A set

of change gears is provided for cutting bands of the various widths. The machine runs from 120 to 160 r. p. m. (Makers, The Cruickshank Engine Co., Providence Rhode Island. Selling agents, Birmingham Iron Foundry, Derby, Connecticut.)

THE CURTIS AIR COMPRESSOR.

It is an indisputable fact that oil is detrimental to pneumatic tires and tubes, but when necessary they are inflated wherever most convenient and without a thought of possible injury due to impure air.

The compressor shown in the accompanying illustration is provided with a special splashing system that prevents oil from entering the cylinder, thereby avoiding the presence of oil in the air supplied to the tires.

Other features are: high and low level oil-filling gages that indicate the amount of oil in the crank case; fly-wheel in fan for cooling the cylinder; inspectable valves; hand unloader facilitating starting compressor under tank pressure, and a head that is easily removed. (Curtis Pneumatic Machinery Co., 30 Church street, New York City.)

OIL-PROOF TIRE INFLATOR.

HERMAN TIRE-BUILDING MACHINES.

One of the salient features of these tire building machines is in the method employed in mechanically centering the fabric on the core while the carcass is being constructed.

By means of a novel centering device, all fabric leading from the rolls is not only automatically centered, but marked and guided into position without aid or assistance from the operator.

This, together with improved tension rolls, gives perfect control and diminishes edge trim to a minimum.

This machine is manufactured in two models, the Special being designed and constructed for making Ford sizes only, while the two-unit or Universal will build any size and style up to

HERMAN SPECIAL TIRE BUILDER.

and including five-inch. Due to the convenient arrangement of the tension rolls, two widths of fabric are always in position to the core on either machine, thus it will be seen that no movement is necessary on the Special, while on the Universal two automatic movements, in which no time is lost to the operator or builder, supply the necessary widths of fabric with which to construct the larger sized tires. (The Herman Tire Building Machine Co., Columbus, Ohio.)

ELAPSED TIME RECORDER.

This device is a time meter or elapsed time recorder and by its use the necessity of subtracting the starting from the finishing time of jobs is entirely eliminated. One machine will compute and print elapsed time for any number of workmen who are engaged upon any number of jobs, irrespective of the order of starting and ending of the operations. It will also print the time of day a job is started and finished. These records may be made on cards or tickets of various sizes and shapes, which can be furnished by any printer.

THE CALCULAGRAPH.

One type of the machine prints elapsed time in hours and minutes, another type in hours and tenths of an hour and there are also different models for computing elapsed time for maximum periods of twelve, twenty-four, and sixty hours. (Calculagraph Co., 30 Church street, New York.)

MINERAL RUBBER CRACKER.

Mineral rubber has a wide range of usefulness in rubber manufacture and occupies an important place as a standard ingredient in rubber compounding. As this material is supplied by the makers in rather inconvenient form, the rubber manufacturers find it necessary to "crack" it. This is effectively accomplished by passing the brittle mineral rubber through a crusher that reduces it to a size suitable for milling.

The machine shown in the accompanying illustration performs the operation of cracking in a satisfactory manner. It is provided with an ample hopper and with a discharge extending the

DAY HERCULES CRUSHER.

full length of the bottom. The belt-driven crusher shaft is provided with heavy breaking lugs that pass between stationary lugs on each side of the cylinder. The machine is 33 inches high, 42 inches long and weighs 450 pounds. (The J. H. Day Co., Cincinnati, Ohio.)

INDICATING CALIPERS.

This useful hand-tool that is a modified outside caliper, comprises a rule, a magnifier and an indicator. It is supplied in two sizes, the 2-inch being graduated in 1/100 inches. Every tenth graduation is marked 10, 20, etc., to 100 and repeated to 200. The fifth intervening graduation is made longer to facilitate quick reading. The scale is three times actual measurement.

The 3-inch indicating caliper is graduated in 1/64 inches. Every eighth graduation is marked 1, 2, 3, etc., to 8 and repeated to three inches. The fourth intervening line is made longer for easy reading. The distance between points on the dial is twice actual measurement.

(Indicating Calipers Co., 506 East 19th street, New York City.)

MACHINERY PATENTS.

MOLD FOR MAKING RUBBER ARTICLES.

MOLDS made of cast iron with the mold surface machined according to the contour of the article are very expensive. So also, molds of white metal cast on a metal matrix involve large expense in making the matrix.

ALUMINUM ALLOY TOY MOLD.

A very satisfactory sand-cast mold for the manufacture of rubber articles may be made by employing an aluminum alloy which is free from ingredients which will unite with the sulphur compound in the rubber article. The alloy consists of approximately 97 per cent of aluminum and three per cent of magnesium and may be sand-cast with a smooth surface to be effectively used without machining. (Fred Thomas Roberts, Cleveland, Ohio, United States patent No. 1,329,312.)

PROCESS OF TREATING TIRE FABRIC.

The object of this invention is the introduction of a lubricant into pneumatic tire fabric, in the form of a suspension or emulsion in the yarn, threads or cords from which the fabric is woven, or into the woven fabric itself.

TIRE FABRIC IMPREGNATOR.

for the escape of the confined air.

The cylindrical tanks are united by a pipe connection. A valve E, controls the flow of the lubricating solution. A steam pipe F, controlled by a valve G, connects the cylinder B, with a supply of steam.

In operation the valves E and G are closed, the detachable head H removed and the roll of fabric I placed in the cylinder. The head being secured in place, low-pressure steam is admitted to the cylinder through valve G. This heats the fabric, and drives out the air through valve D. Valve G is then closed and valve E is opened. Cold emulsion or suspension from tank A enters cylinder B and comes in contact with the hot water vapor. Condensation follows, automatically producing a vacuum which allows the emulsion or suspension to permeate the interstices of the fabric.

After this takes place atmospheric pressure is admitted to cylinder B and the surplus fluid pumped back into the tank A through the pump J. The fabric is then removed and thoroughly dried, leaving the lubricant in intimate contact with the fibers. (William C. Carter, Radnor, Ohio, assignor to The Goodyear Tire & Rubber Co., Akron, Ohio. United States patent No. 1,327,904.)

METHOD AND APPARATUS FOR MAKING BICYCLE TIRES.

The object of the improvement of the means and method for forming pneumatic tires, particularly single tube bicycle tires, is the elimination of sharp bends in the fabric at the point where it passes over the valve cot and the perfection of the adhesion between the head of the valve cot and the material forming the tire. The tire is built upon the drum A which has a diameter substantially equal to the inner diameter of the tire to be produced, and having an axial slot B adapted to give clearance for the valve cot. The tire forming materials of rubberized fabric and uncured rubber C are laid circumferentially on the drum and folded into tubular form over a spacing strap D provided with a handle for convenience.

As the layers are folded, the material is tightly sealed with a hand tool and the strap drawn along. The last few inches of the circumference of the tire is folded without the spacing strap and pressed without backing.

A spheroidal depression is provided in the strap, into which the head of the valve cot and the fabric covering it may sink. This permits any desired amount of pressure being exerted by the hand tool around the valve cot without danger of bending the fabric layers at this point and ensures more perfect adhesion between valve cot and fabric. (Joseph A. Bowerman, assignor to The Fisk Rubber Co.—both of Chicopee Falls, Massachusetts. United States patent No. 1,327,802.)

New Goods and Specialties.

WATCH-CASE TELEPHONE RECEIVER.

WATCH-CASE TELEPHONE RECEIVERS encased in shells of hard rubber or of a composition to substitute hard rubber are a convenient development of telephonic accessories. The one shown here in the first illustration on the page is adapted to hang on the receiver-hook of any telephone. It is also used in the head-piece of the "National" radio receiver, in that case being pivoted for easy adjustment, without the hook for hanging.

CONVENIENT TELEPHONE RECEIVER

The working parts of the receiver are mounted in a metal cup independent of the shell, thus assuring greater mechanical strength and permanent adjustment. The second illustration shows the construction, detail B giving the assembly of the permanent magnets, coils, and terminal block in the cup. The diaphragm A rests on the rim of the cup B which is set inside the shell C and securely locked by the ear-piece D. Temperature thus cannot affect the adjustment. The magnets are laminated, semi-circular in form, and adapted for retaining their strength permanently. (The Holtzer-Cabot Electric Co., 115 Amory street, Roxbury, Mass.)

RECEIVER PARTS—DETAIL

BIFF, A NEW GAME.

The devising of a new game means more business for the sporting goods dealer who carries the ball or other articles used in playing it. "Biff" is a form of tether ball. An ordinary punching bag is tethered at the top of a four-foot standard which can be anchored on an ordinary table. The players stand at each end of the table and knock the ball back and forth, the object being to wrap the tether rope around the standard in spite of the opponents' blows. (Thos. E. Wilson & Co., Chicago and New York City.)

"LIFE-BODY" RUBBER BOOT.

RUBBER BOOT WITH SILK TOP.

A rubber boot for wear by misses and children, especially practical and convenient during the spring thaws in both country and city, is made with a glossy finished watered silk top, while the foot section is of plain black varnished rubber. The entire boot is lined with black fleece lining to assure the wearer against coldness. The rubber part extends well up on the top at the back and front. The sole is of the knurled type to give

secure footing, and there is a comfortable low heel. The sizes run as small as No. 4 for children. (The Kaufman Rubber Co., Limited, Kitchener, Ontario, Canada.)

TIRE PATCH APPLIED WITH FUSE.

A device for applying patches to tires and tubes, rubber boots and shoes, hot-water bottles, hose, life preservers, or other articles made of rubber is called the "Tong-em-on" vulcanizer, and with this are provided a set of patches, two coppered pans (puncture and blow-out sizes), fuses, and a buffer. The method of application is to roughen thoroughly the surface of the article to be repaired, stick a patch to the bottom of copper pan, remove cloth, and clamp over hole. By sliding back the floating rivet in the slot the tong is kept closed. Two fuses are then put into the pan and lighted with a match. These furnish sufficient heat to cure the patch into place permanently. The article can then be used immediately. The "Tong-em-on" vulcanizer is nickel-plated. (Tong-em-on Vulcanizer Co., 626 Plymouth Building, Minneapolis, Minnesota.)

"TONG-EM-ON" VULCANIZER.

"KEWPIE" BABY PANTS.

The use of rubber in the manufacture of articles intended for sanitary purposes has resulted in many practical adaptations which utilize both hard and soft rubber, rubber tubing, sheet rubber, etc. One of the later developments of sheet rubber is in the manufacture of baby pants. These are intended to slip on over the diaper and fit snugly enough to protect the clothing, yet are comfortable for the baby to wear. The style shown here is called the "Kewpie," and is patented. Shirring at the waist and leg openings is cemented to strips of rubber which permits the openings to stretch sufficiently for easy adjustment. The manufacturer also makes a full line of other rubber sanitary baby pants, aprons, sheetings, etc. (The Climax Specialty Co., 915 Pine street, St. Louis, Missouri; owner of trade mark, Maude Sinclair George.)

"KEWPIE" BABY PANTS.

INTERCHANGEABLE, DETACHABLE HEEL LIFTS.

A new development of the interchangeable, detachable rubber heel lift for both men's and women's shoes is shown in the accompanying illustration. The heel base remains at all times attached to the shoe and to this base is attached a metal plate in which are curved slots extending upward. The heel lift of rubber has an equal number of pegs extending beyond its inside

MAYOROWITZ PATENTED HEEL.

surface to engage the slots in the heel base. After the heel lift is put into place and struck a sharp blow to drive it into alignment it is locked by a sliding key. The metal parts are of non-corrosive metal. This idea has also been adapted for women's French heels. (Maurice Mayorowitz, 720 East 9th street, New York City.)

surface to engage the slots in the heel base. After the heel lift is put into place and struck a sharp blow to drive it into alignment it is locked by a sliding key. The metal parts are of non-corrosive metal. This idea has also been adapted for women's French heels. (Maurice Mayorowitz, 720 East 9th street, New York City.)

TIRE VALVE AND GAGE IN ONE.

A tire valve that combines with its primary function that of gaging the pressure of air in the tire is a convenience that most car owners will appreciate, as it does away with the bother of applying a separate gage to determine the amount of air pressure

PULVERMAN TIROMETER VALVE.

at any given moment. This device, called the Pulverman Tireometer valve, has a transparent dust cap, within which is positioned the gage so that it can be easily read without removing the cap. This valve can be substituted for the ordinary valve on any tire, as it fits any pneumatic tube. (Tireometer Valve Corporation of America, Charleston, West Virginia.)

"AIR-PEDS" FOR HEELS AND SOLES.

A new development of the rubber heel and sole is shown here in a set of three pieces of corrugated rubber, one to be attached to the heel and two to the sole of any shoe. The corrugations are so arranged that they minimize the liability to slip, according to the claim of the manufacturer, because in each piece the corrugations run in different directions. Because "Air-Peds" are in three pieces, they are not liable to draw the feet. They are attached in the same way as rubber heels but cannot crack or rip. These attachments are suitable for use by laborers, business men, sportsmen, golfers, etc. They may be had in either black or tan rubber. (Pioneer Products Co., 35 West 39th street, New York City.)

"AIR-PEDS."

A LATE CORD TIRE.

One of the newcomers in the cord tire world is pictured here. It is made by a comparatively new company that specializes in cord tires only and is produced by special machinery and processes. The "Syracord" tire is notable for its Universal tread which is supposed to give a positive action against skidding as well as to possess the easy riding and steering qualities of the ribbed tread. (Syracuse Rubber Co., Inc., Syracuse, New York.)

"SYRACORD" TIRE.

"PORCUPINE" BLOW-OUT PATCH.

The "Porcupine" blow-out patch is so called because its outer surface is bristling with metallic quills which embed themselves in the inner side of the damaged tire, the points being driven in tighter with each revolution of the wheel. It is easily and quickly applied, even by those least experienced in tire repairing. (The Auto Boot Manufacturing Company of California, Los Angeles, California.)

NEW TIRE ACCESSORIES.

A new tire valve, called the "Newsom," is so constructed

that it does not depend alone on the air pressure against the valve gasket to hold the air in the tube, but has an additional protection against the possible escape of air, in a cap nut which is screwed to the upper end of the stem and by which the valve gasket is drawn firmly against the valve seat at the base of the housing, thereby sealing the valve and holding at a constant standard pressure the air in the tube. The gasket at the base of the valve is of rubber. The tire is inflated by removing dust cap, unscrewing cap nut, and adjusting air hose in the usual way. In order to replace the cap nut, it is only necessary to screw it on tightly with the fingers. Pliers should not be employed for this purpose.

The "Snap-Lox" dust cap shown here gets its name from the ease with which it snaps on. It consists of two parts—the bushing and the cap. The cap proper has four slots at its base which allows it to be snapped over the upper end of the bushing.

(Newsom Valve Co., 2714 Lasalle street, St. Louis, Missouri.)

"SNAP-
LOX"
DUST
CAP.THE "NEWSOM"
VALVE.**AN OFFICE AND HOUSEHOLD CONVENIENCE.**

Every business office and household finds the rubber band a convenience or necessity. Neat boxes, with hinged covers, partitioned off to hold assorted sizes, sell at from 25 cents to \$1 at retail. The bands are bright red, of good quality. (Eberhard Faber Rubber Co., Newark, New Jersey.)

ANOTHER SUPERSIZE CORD TIRE.

One of the newest supersize cord tires is the "Parker." It is built by hand of high-grade materials, carefully finished, and is distinguished by a white stripe running around the edge near

"PARKER" SUPERSIZE CORD TIRE.

the rim. The tread is a combination rib and non-skid, suited to both front and rear wheels. (The Parker Tire & Rubber Co., Indianapolis, Indiana.)

Practical Advice to Repairmen.

By A. B. Zuehl.

IN MY LAST ARTICLE¹ I related my experience of calling on some fifty-odd tire repairmen throughout the East, and I will now cover the high spots governing tire rebuilding, which should interest both the user of retradders, as well as those contemplating going into this line of business.

Retreading is bound to be popular this year, and so long as tires are high in price, and there appears to be no reduction in cost of labor and material, and as worn treads represent only a fractional part of the actual tire—25 per cent to be exact, there remains 75 per cent of the actual tire to be used, which, after retreading will deliver from 2,500 to 5,000 miles service. An economical person would not throw away a perfectly good suit of clothes just because the lower edge of his trouser cuff was worn. He would have them repaired, because it represents only a fractional cost of the suit.

The tire manufacturer aims to build a balanced tire—one in which the tread is just thick and tough enough to last as long as the carcass. It would be poor business to follow another line, for if the tread was two inches thick (where one inch would suffice), a customer would naturally say the fabric was rotten if the tread was good and the fabric broken, or separated at the end of 5,000 miles. Reverse the situation; too much fabric is just as bad as not enough, for the tire could not perform the duty it was designed for, and instead of flexing it would be too stiff and eventually break down. Ask any tire manufacturer and he will tell you what has made the six-, seven- and eight-inch truck tire possible—cord construction, for one thing, and development. So you as a tire rebuilder, should be able to develop along the same line as the tire manufacturer, and soon be able to rebuild a tire giving 6,000 to 8,000 miles. What experience has done for the manufacturer it will do for you.

Data gathered from Texas to Canada and from New York to Seattle demonstrated that many combinations of repair material were being used. One repairman used one brand of cement, another brand of breaker fabric, another brand of cushion gum and still another brand of tread stock. This practice should be discouraged, for a manufacturer or jobber who sells you a cushion gum with a recommended cure of 50 pounds at 50 minutes, and a tread stock with a 50 pounds at 50 minutes cure is not giving you a combination that will make a successful retread. The cure recommendation no doubt was based on a flat pipe; in other words, when the uncured rubber comes in direct contact with the mold itself (rubber being a non-conductor of heat), the tread would be sufficiently cured, whereas the breaker fabric and cushion, not forgetting the cement, would be greatly undercured.

Retreading stocks are then not merely ordinary repair materials, but "specially compounded retreading stocks," designed, compounded and balanced. A retreaded tire requires a tread stock that is softer than the ordinary run of repair material. It resists road shocks and saves the carcass from bruising. It is important to use not too much or too little material; an extra ply of tread gum will not necessarily add a thousand miles of extra wear. It may decrease the wear of the tire even to a greater extent, for it will have a tendency to undercure the cushion and cement, which is a vital part of the entire job.

Don't use cheap repair materials and expect your retread to stand up. Tread stock that can ordinarily be purchased at 35 cents to 40 cents a pound will be expensive compared with tread stocks selling at 80 and 90 cents a pound. Comparing these stocks on a 34 by 4 carcass, the cost was found to be 35 cents

more than when retreading with the 80- and 90-cent stock, but the results were worth the difference. Forget you are getting a bargain when a salesman offers you repair stocks at 35 cents a pound. Good crude rubber costs around 50 cents a pound, and when you buy retread stock make up your mind you are buying something else besides rubber. Analyze your own situation, cut off a pound of cheap gum, and a pound of high-grade stocks, compare the gage of the stock and figure the difference in yardage. Remember, rubber is one of the lightest ingredients going into the compound, and the lighter in weight per yard the higher the rubber content. Rubber stock has always been sold by the pound, but I contend it should be sold by the square yard or per tread of given dimensions.

The proper selection of a carcass is another vital matter, and while we can't look between the plys of fabric, we can avoid a lot of trouble by being careful, making a thorough examination and turning out a satisfactory job.

Start your work with a good foundation. Give the cement a clean new surface to cling to; remove the outside ply of fabric and you eliminate one of the worst enemies—dirt. Make up for the loss of the outside ply by vulcanizing a 3-ply liner inside, strengthening and building service into your tire. Vulcanize the liner in. Do not merely cement it in. By vulcanization it becomes a part of the tire, strengthening the weakness you overlook and cannot see.

Rebuild your tire. Do not simply retread it. When the tread is gone, your tire needs an overhauling and the cost of rebuilding is only a trifle more than retreading. Repairs should be made after the tread has been removed. Do not make a repair and retread at the same time. Your cure is not long enough to reach through to the inside of the tire. Make all repairs first and semi-cure, then rebuff the tire previous to cementing the carcass for the retread in the usual way.

Rim cuts can be successfully repaired, but judgment should be exercised by the repairman. A rim cut caused through accident, such as a bad bump or curb bruise, can be successfully repaired, for the chances are that the balance of the tire is in first-class condition. But a rim cut caused by a tire being run underinflated is very much of a gamble to repair, for the chances are it is weak in another place and will soon blow out from the strains.

Resetting treads can be accomplished very successfully on the following occasions:

1. If the side walls of the carcass were oil-soaked and the rubber pulled off while being removed from the mold.
2. Where the carcass blew out at the bead after running a short distance.
3. When the fabric separated due to moisture.

To remove the tread, cut along the tread line with a knife around each side of the tire to the fabric. Pry loose with a prying tool or screw driver and work a section loose. Then insert a broom handle and, with a little effort, time and patience this entire tread can be removed in one piece. An easier method is to cut across the tread and pull it off in the regular manner. The latter way is much easier, and the results are as good, the only difference being the fact that you have to resplice the tread, but this is an easy accomplishment.

In resetting a tread use one new ply of cushion gum only, as the breaker fabric will come off and adhere to the tread. It is advisable to let the cushion gum extend down the side of the tire one-half to three-quarters of an inch in order to piece in new strips of tread stock, trimming them off flush so as to make a neat job, otherwise there will be an offset. Don't over-

¹ "Practical Hints on Retreading," THE INDIA RUBBER WORLD, December 1, 1919, page 159.

look the resetting of the tread. Try it. If your first job does not make a creditable showing you will at least get the fundamental idea and your next attempt will surprise you.

A second curing operation is necessary, but this is the same as though you were curing up a freshly built carcass. A little caution should be used in seeing that the tread is laid straight and that you get the grooves of the tread in the grooves of the mold. Surprising results can be obtained with very little practice.

We learn a great deal from the other fellow, and here is a little "kink" I know will interest you. To follow the lines of least resistance is not always the best course to pursue, but in this case I am sure it is. The higher up you can cut off the old tread of a tire, the better the appearance of the finished tire. If you cut a tire down beyond the 45-degree you have to build it up with new stock costing money, and besides, you are apt to cause an overflow of stock if the sand bag does not fit snugly. To cut down the tire evenly all around saves time in rebuilding it, whereas, if you follow the line of the loose tread and side-walls it is necessary to do a lot of piecing, which takes up time, and when the tire is finished you have the appearance of a patched-up job. The suggestion is to cut the tire evenly all around in the center of the 45-degree, if possible. If there are any loose particles of tread or side wall, lay them back, buff out the dirt, cement both the carcass and side walls, or even shoot in a small amount of cement with an oil gun. Then hang the tire so the cement will drain, place a piece of cushion gum between the carcass and the flap referred to, roll down the flap and you have effected a saving in labor, material and have an altogether better and neater looking job.

INTERESTING LETTERS FROM OUR READERS.

AS TO LABOR TROUBLES.

TO THE EDITOR:

DEAR SIR:—No one has found a panacea for labor trouble, for one reason at least. The problem has not been approached in the proper spirit. It is hard to get away from the old attitude of capital towards labor, of patronage; "I've got the money, and you should be glad to get the work!"

There is little doubt that capital has, by and large, been unfair towards labor, and in some aspects has been guilty of down right stupidity. For example: capital would have nothing to do with so-called scientific methods forced to it by the exigencies of business, and then rushed into, and made a mess of time studies as demonstrated in the piece-work rates made therefrom. Capital, thereupon, in many instances, made another almost criminal blunder in cutting down the rate where workmen made more than, in the judgment of the employer, constituted a fair day's wage, whatever that may be.

This resulted, as was to be expected, in distrust, and resort to all sorts of underground methods to beat the game that capital itself had "called."

This has gone on for years during which it has been apparent that, instead of being a coking good team, capital and labor were pulling in opposite directions, with the result that nobody was getting anywhere.

In the meantime, labor found out there was money in nursing a grouch, and has been making an extensive and more or less successful use of it.

As capitalistic methods aroused the antagonism of labor, so now labor methods are arousing the resistance of the great, patient, somewhat stupid middle-class American, who, if he loves anything, loves a square deal.

That capital cares particularly for the "signs of the times," I very much doubt, but having come to a clear impasse, their good sense demands that they find a real solution for the problems that are in a fair way to confound them.

There are some aspects of the labor attitude that indicate that it is beginning to be obsessed with the idea that it can do about

as it pleases. One weak spot in such an attitude lies in the fact that it drags in the innocent bystander who is put to all sorts of inconvenience and loss in a game in which he has not been asked to assist. He doesn't relish such a one-sided game, and so, has let out a series of yells and kicks that has attracted considerable attention.

The innocent bystander is insisting on a square deal all around, and will continue to make himself more and more disagreeable until somehow, sometime, somewhere, the matter will be thrashed out to the mutual advantage of all.

Everywhere in this country is heard the demand for production. Labor, as organized, is doing its best to prevent it, self-hypnotized with the notion that to concede this point makes for its best interests. It is hard to understand this point of view, and it will have to be educated out. This can be done by making it an inducement for labor to change its attitude and this attitude can be changed from hostility to one akin to loyalty, by proving to it that improved machinery and processes will make more goods, and that the greater the production, the fatter the pay envelope.

EFFICIENCY.

GERMAN RUBBER TRADE CONDITIONS.

TO THE EDITOR:

DEAR SIR:—It is with great pleasure that I comply with your request to inform you regarding the changes brought about by the world war. As it is the whole world over, wages have increased considerably in Germany compared with those paid in times of peace. The rate of wages is four and five times as high now and amounts at present to 4 marks per hour. We hope that rate will be stagnant for some weeks or about two months to come. After this time no doubt a further increase will take place.

As far as the attitude of the workmen is concerned, a marked improvement has come about. There was a decided aversion against work when the war was over and the revolution broke out and in many cases the workmen showed themselves refractory. Workmen's councils (like the shop stewards in England) were formed and acted as plenipotentiaries. Any wish of the workmen gave rise to long discussions between the workmen's council and the management. All this was brought about by the long duration of the war and by the bad physical state of the people which was due to the insufficient supply of food. Irrespective of this there was a great lack of employment on account of changing the industry for peace work. From the moment that food was better obtainable, the workmen naturally began to show more interest in their occupation. Thus matters have considerably improved, although we are yet far away from the ante-war state. The general institution of the eight-hour day on the other side caused a decrease in production, especially as regards coal mining and agriculture. It, however, now begins to dawn that working hours must be increased, as otherwise there is no help for Germany, having had to fight for five years in the war and having lost it after all.

On the whole, at all events regarding the state of affairs in our district, I am glad to be able to say that everything goes comparatively well, especially as the influence of the radical elements, which never was great to any extent, is now waning away altogether. All other rubber factories in Germany are laboring under almost similar conditions, as much as I can say.

All we want is coal and raw material, and from the moment we could be supplied with these regularly, the works could be kept up running uninterruptedly.

You will perhaps be aware that now the workmen are represented by their voted members—instituted by law—and rather valuable concessions have been made with regard to their allowing them to look into the balance and to discuss in a somehow limited manner all questions regarding employment and discharge

of hands. Therefore all the revolutionary achievements are being guaranteed by law. These concessions, however, do not satisfy the radical elements who would prefer a state of affairs similar to that in Russia, but for which our present socialist government so far has shown no inclination.

WILLY TICHBEIN.

Continental-Caoutchouc und Gutta-Percha Compagnie, Hannover, February 17, 1920.

NEW TRADE PUBLICATIONS.

A NEW RUBBER JOURNAL, "THE RUBBER AGE," published monthly, has appeared in London. It has an attractive typographical dress, and handles the many sides of the rubber industry in Britain in an interesting manner. A glance at the future of the rubber industry makes an appropriate beginning.

The first number does not reveal the name of the editor, but mentions Herbert Standing, a rubber expert, as his assistant. The offices of the English "Rubber Age" are at 43 Essex Street, Strand, London, W. C. 2.

THE RUBBER FOOTWEAR CATALOG ISSUED BY THE KAUFMAN RUBBER CO., Kitchener, Ontario, Canada, shows that the special needs of the Far North and the wilds are well cared for, as well as the calls of civilization. Branches are established at Vancouver, Saskatoon, Calgary, Edmonton, Regina and Winnipeg, as well as in the older capitals of the Dominion, and pictures of the rubber boots for women, the heavy goods for fishermen, lumbermen, curlers, railroad men and pioneer farmers give some idea of how the requirements of the severe climate are met. Besides these are shown the rubber boots and shoes for city wear.

W. H. SALISBURY & CO., CHICAGO, ILLINOIS, ONE OF THE OLDEST rubber dealers in the world, dating from 1855, has issued an illustrated catalog of rubber goods and leather belting which gives some idea of the infinite variety of uses for india rubber. Every rubber article, from automobile tires, hose and belting to elastic bands and surgeons' finger cots and golf balls, is found in it. Tables of sizes and weights and power are given for every article, which are of permanent and general utility. It makes a handsome and artistic little book.

THE FUJIKURA DENSEN KABUSHIKI KAISHA, THE FUJIKURA Insulated Wire and Cable Co., Tokio, Japan, issues in English a handsome catalog of its electric wires and cables. The company was started in 1885 by Z. Fujikura and has been developed largely through the efforts of its present president, T. Matsumoto. The greater part of the pamphlet is given up to lists of standard sizes, but it contains also illustrated descriptions of the various forms of cables, with the catalog numbers and code names. It is a characteristically artistic product, as well as useful to all concerned with the wire business.

"TRAINING FOR FOREIGN TRADE," BY R. S. MAC ELWEE, F. G. Nichols, and collaborators, is issued by the Department of Commerce, Washington, D. C. (Paper, 9/4 by 5 1/4 inches, 196 pages.) This government publication is a triumph of methodology, the subject being neatly subdivided according to library bureau systems. Various courses are outlined in very full detail after the manner of business schools, equal stress being put on important and unimportant matters.

The commercial division of the world seems practical. There are elaborate and interesting syllabuses on Latin America and on the Near East, which means here the Ottoman Empire and the Balkan states, with lesser ones in Russia, the Far East, meaning China, Japan, the Philippines and the Dutch East Indies, and the study of modern languages. The last would have been improved if good dictionaries had been indicated with the other text books. The pamphlet should be useful in many ways.

A HANDSOME ILLUSTRATED FOLIO PAMPHLET DESCRIBES THE "ADVERTISING FOR 1920" of the Mohawk Rubber Co., Akron, Ohio. It shows the magazines and other publications used, the posters

and sizes, the movie films and other forms of pictorial advertising and gives the text employed also.

AN INNOVATION IN CALENDARS IS THE LARGE ONE "MINERS' Catalogue and Calendar" for 1920, issued by the Miner Rubber Co., Limited, Montreal, Canada, which runs from March, 1920, to February, 1921. Behind the double calendar sheets are pages describing the goods made by the company illustrated in colors. These are indexed on the margin, a dozen being given up to boots and shoes, one to hats, capes, coats and aprons, and one to sizes of packing. As the headquarters are in Montreal, Canadian holidays are marked on the calendar.

"RECOMMENDED SPECIFICATION FOR BASIC SULPHATE WHITE LEAD, DRY AND PASTE," prepared and recommended by the United States Interdepartmental Committee on Paint Specification Standardization, September 22, 1919; P. H. Walker, chairman; H. E. Smith, secretary. This pamphlet of eleven pages is Circular No. 85 of the Bureau of Standards. It covers sampling, laboratory examination of dry pigment and paste, and the preparation of the reagents required.

"DETERMINATION OF CELLULOSE IN RUBBER GOODS," BY S. W. Epstein, and R. L. Moore. Technologic Paper No. 154 of the Bureau of Standards. Analytic method and results.

THE "Bulletin de la Société Belge d'Etudes Coloniales" (Hayez, 112 rue de Louvain, Brussels), after a silence of four years on account of the war, came to life again in 1919, and naturally in the first numbers tried to tell the happenings of the war period. General Baron Bondy, the president of the society, himself writes the story of the fighting on the two German frontiers of Belgian Congo, while officials tell of the administrative and economic changes in the colony.

THE GENERAL TIRE & RUBBER CO., AKRON, OHIO, is conducting an advertising campaign with the tire slogan, "It goes a long way to make friends." A series of attractive posters with illustrations in black and white colors, reproduced from oil paintings by a famous artist, picture General tires making friends in many countries of the world.

THE EDITOR'S BOOK TABLE.

"TIME STUDIES AS A BASIS FOR RATE SETTING," BY DWIGHT V. MERRICK. The Engineering Magazine Company, New York, 1919. (Leatherette, octavo, 5 1/4 by 9 inches, 366 + 18 pages.)

THIS is a technical manual of scientific time study based on the ideas of the late Dr. Frederick W. Taylor, and is an excellent example of the results in business training of the modern efficiency methods. The author first presents the principles, methods and implements of time study, then gives an example by applying his principles to a line of machine tools giving the detailed times as established by study, and finally, in a series of appendices, gives detailed times for a number of other kinds of work, thus demonstrating the adaptability of his principles and methods. The book has illustrations and many diagram tables.

HEATON'S ANNUAL, 1920. THE COMMERCIAL HANDBOOK OF Canada and Boards of Trade Register. Heaton's Agency, 32 Church street, Toronto, Ontario, Canada. (Cloth, duodecimo, 4 1/4 by 7 1/4 inches, 550 + 38 pages.)

Heaton's Annual of Canada, is out for 1920, marking the sixteenth annual appearance of this extremely useful commercial handbook. The gazetteer of the towns of commercial importance in Canada is accompanied by maps. As usual, full information is given regarding customs and postal regulations; transportation facilities; financial institutions and methods; the resources, natural and industrial, of the various provinces; taxes, patents and other matters of importance. A directory of officials and Government departments, consuls and so forth is provided, with useful tables of weights, coins, interest and similar matters. It would be a convenience if Newfoundland could be included in the Annual, even if it is no part of the Dominion.

"FOR A BETTER AMERICA." BY A. H. ALDEN. A MANUAL FOR the consideration of the American voter. Published by the author.

Emphasizing the truism that "Politics ought to be the most honorable business in the world," Mr. Alden, who is widely known and esteemed in the rubber trade, in a neat brochure, appeals to the American electorate to take a livelier, patriotic, and non-partisan interest in the selection of the men who make and administer the nation's laws. Appreciating the usefulness of political parties, he contends that they should be tolerated only as a means for obtaining better government and not for rewarding mercenary politicians or aiding selfish labor, capitalistic, or other classes. He would have independent voters so aggressively organized that they would indeed hold the balance of power, and the great parties would eagerly court their favor, not merely by repressing vicious elements within their own ranks but by even vying with one another in presenting capable and deserving nominees. Especially does he urge the foundation of a central, independent bureau to teach the science of government and to impart to the oft-bewildered citizen that complete, truthful, unpartisan information on national affairs which is the right of every American.

THE OBITUARY RECORD.

A WELL-KNOWN NEW ENGLAND RUBBER MAN.

ALEC J. MAYBERRY, manager of the Boston, Massachusetts, branch of the United States Rubber Co., died suddenly of acute indigestion at his home in Allston, February 26, 1920, aged 49 years.

ALEC J. MAYBERRY.

Mr. Mayberry was born in Bangor, Maine, May 22, 1870, and attended the grammar and high schools there. He became associated with the retail shoe business in Bangor, later accepting a position as traveling salesman for the Adams Dry Goods Co., resigning in 1897 to accept a similar position with Converse & Pike, traveling in Maine. With this firm and the Tremont Rubber Co. he remained until 1910, when he went to the Springfield Rubber Co., Springfield, Massachusetts, as president and treasurer. In 1916, he was made manager of the Boston branch of the United States Rubber Co., a position which

he held until his death.

Mr. Mayberry's untimely death was a severe shock to his fellow employees who greatly liked and respected him. During his rubber career he had become known throughout the trade in New England and elsewhere. He was a member of the Boston City Club, the Shoe Trades Club, and various bodies of the Masonic fraternity. His wife died about two years ago, and surviving him are his mother, two sisters, Miss Carrie Mayberry and Mrs. Joseph Stewart, and also a brother, Herbert A. Mayberry. Mr. Mayberry also leaves a step-son, Stanley A. Bridges, of Winthrop, Massachusetts.

DIRECTOR OF A NEW AKRON RUBBER COMPANY.

Judge Dayton A. Doyle, a director of the recently organized Doyle Tire & Rubber Co., died February 28, 1920, in Akron, Ohio, from hardening of the arteries, aged 53.

It was as a lawyer and as one of Akron's most prominent life-long residents that Judge Doyle was best known. Born September 27, 1856, he was graduated from the Akron high school, Buchtel College and later from the Cincinnati Law School with degrees of A.B. and LL.D. He was admitted to the bar in 1882

and entered law business with ex-Senator Dick. The firm was known as Dick, Doyle and Bryan with offices in Akron and Washington, D. C.

He later served two terms as city solicitor, two terms as referee in bankruptcy and two terms as judge of the Summit County Common Pleas Court, his term expiring January 1, 1918, when he returned to private practice.

He is survived by his widow, three sons—Dayton A., Jr., Arthur W. and Frank W., and three daughters—Harriet E. and Ida Ruth Doyle and Mrs. Harold Bellzel.

PRESIDENT OF A. SCHRADER'S SON, INC.

Dr. Charles K. Cole, president of A. Schrader's Son, Inc., Brooklyn, New York, manufacturer of pneumatic tire valves and accessories, died recently at Pasadena, California, aged 67.

Dr. Cole was born in Plainfield, Illinois, and began the practice of medicine in Helena, Montana, upon completing his education, and there also became prominent in public, business and social affairs, holding many positions of trust. Later, at the instance of his friend George H. F. Schrader, he established his permanent residence in New York City at Chelsea-on-the-Hudson and in 1914 became president of the Schrader company.

Dr. Cole was a member of the Rocky Mountain Club, Montana Club, Old Colony Club, Aero Club of America, and also held membership in several fraternal organizations including the Elks, F. and A. M., Odd Fellows, Knights of Pythias and Ancient Order of United Workmen. He is survived by his widow, Harriet Gillett Cole, a son, Dr. Philip Gillett Cole, and a daughter, Miss Alma Gillett Cole. Interment was at Maple Grove Cemetery, Brooklyn, New York.

SECRETARY OF A TRENTON RUBBER CO.

Horace M. Royal, secretary of the Home Rubber Co., Trenton, New Jersey, dropped dead on March 20, 1920, at his home in Morrisville, Pennsylvania. He had been in poor health for the past year and suffered from heart trouble. The death came as a great shock to the members of his family and his friends in the trade.

Mr. Royal, who recently removed from Trenton to Morrisville, was born in Germantown, Philadelphia, and after receiving his early education there, went to Trenton, where he secured employment with the Home Rubber Co. He was promoted at different times and from a minor position rose to the office of secretary. His amiable disposition won him many friends. He was a member of Column Lodge, Free and Accepted Masons, the Scottish Rite and the Shrine. He is survived by his widow and three sons, Joseph, Edward and Horace M. Royal, Jr.

A RUBBER MACHINERY ENGINEER.

Melvin B. Newcomb, aged thirty-one years, chief engineer of the rubber machinery department of the Wellman-Seaver-Morgan Co., died March 13, after a short illness at his home, Akron, Ohio.

Mr. Newcomb was born in 1889 in Bridgeton, New Jersey. He received his mechanical engineering education at the University of Wisconsin. He has been engaged in engineering work with the I. P. Morris Co., Philadelphia, Pennsylvania. The Allis-Chalmers Manufacturing Co., Milwaukee, Wisconsin; The Wisconsin Engine Co., Corlis, Wisconsin, and The Firestone Tire & Rubber Co., Akron, Ohio.

In January, 1918, he joined the hydraulic turbine engineering department of the Wellman-Seaver-Morgan Co., and a few months later he was appointed chief engineer of the rubber machinery department.

Mr. Newcomb was a member of the American Society of Mechanical Engineers, the Cleveland Engineering Society and the Akron Engineering Society. He leaves his widow and two young daughters.

MACHINE SHOP FOREMAN OF THE AMERICAN RUBBER CO.

Michael F. Murphy, foreman of the machine shop of the American Rubber Co., East Cambridge, Massachusetts, died January 4, 1920, at his home, 49 Thornyke street, Brookline, aged 69 years.

Mr. Murphy was born in South Boston April 2, 1850, and his association with the rubber business began many years ago in the employ of the late Robert D. Evans. He went to the American Rubber Co. on March 26, 1886. He is survived by a widow and nine children.

A VETERAN EMPLOYEE OF W. H. SALISBURY & CO.

Charles Frederick Luders, who was connected for over half a century with W. H. Salisbury & Co., Inc., of Chicago, the well-known distributor and manufacturer of rubber goods, died in Chicago January 31, 1920, of heart failure. Mr. Luders was born in Wismar, Germany, February 24, 1850, and had therefore nearly attained his seventieth year. He came to Chicago when six years of age and entered the service of W. H. Salisbury & Co. as errand boy in 1864. He worked his way up till he became general manager. Mr. Luders was obliged to retire some years ago as cataracts formed on both his eyes from which he could not obtain relief. He leaves his widow and three children, Fred, Etta and Elmer Luders.

CHARLES F. LUDERS.

Mrs. FANNIE E. THOMAS, WIDOW OF THE LATE DAVID E. and mother of John W. Thomas, vice-president, and Edwin T. Thomas, Minneapolis manager of the Firestone Tire & Rubber Co., died in Tallmadge, Ohio, January 6, 1920, at the age of 75 years. She was born in Pembrokehire in Wales, December 27, 1844, and in 1848 was brought to the United States by her parents who settled in Tallmadge. She was one of a family of eleven children and was the mother of eight, seven of whom survive her, two daughters and five sons.

SAMUEL KRAUS, VICE-PRESIDENT OF THE EAGLE PENCIL CO., New York City, died January 3, 1920, in his sixty-ninth year. He was connected with the pencil company and its predecessors from the time he was fourteen years of age, becoming in time superintendent and later vice-president in charge of the manufacturing departments.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(783.) A reader asks for the addresses of concerns which have to sell scrap rubber belting suitable for cutting into soles.

(784.) An inquiry has been received for the addresses of manufacturers of machinery for making bathing caps.

(785.) A correspondent requests the addresses of concerns manufacturing tire half-soles.

(786.) A reader desires the addresses of makers of embossed metal plates for branding tires.

(787.) Request is made for the addresses of manufacturers of flexible or semi-flexible rubber that will withstand repeated boiling in water and retain its vitality.

(788.) A manufacturer asks for the addresses of the concern making the Bragg or any other automatic rubber mixer.

(789.) A rubber manufacturer asks whether there is manufactured at the present time a mixing mill with a cover which will prevent carbon black from flying about in the mill-room; if so, the manufacturer's address is desired.

(790.) Request is made for the addresses of manufacturers of golf ball molds.

(791.) A correspondent desires to have rubber spraying bulbs made in thousand lots. He has the molds.

(792.) An inquiry has been received for the addresses of the manufacturer who can supply policemen's clubs made of rubber.

(793.) A correspondent asks for formulas for making rubber or vulcanite grinding wheels.

(794.) Request is made for the addresses of manufacturers of forms for making toy balloons.

(795.) A reader asks for the percentage of antimony and tin melted together by the average hard-rubber manufacturer for casting molds for hard-rubber goods.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Requests for each address should be on a separate sheet, and state number.

DISTRICT OFFICES.

New York: 734 Customhouse.
Boston: 1801 Customhouse.
Chicago: 594 Federal Building.
St. Louis: 402 Third National Bank Building.
New Orleans: 1020 Hibernal Bank Building.
San Francisco: 307 Customhouse.
Seattle: 848 Henry Building.

COOPERATIVE OFFICES.

Cleveland: Chamber of Commerce.
Cincinnati: Chamber of Commerce.
General Freight Agent, Southern Railway, 96 Ingalls Building.
Los Angeles: Chamber of Commerce.
Philadelphia: Chamber of Commerce.
Portland, Oregon: Chamber of Commerce.
Dayton, Ohio: Dayton Chamber of Commerce.

(32,060.) President of commercial organization in Bulgaria desires to secure an agency for rubber shoes. Correspondence may be in English.

(32,086.) A merchant in Italy desires to secure an agency for rubber articles, bandages, and tires for automobiles and bicycles. Quotations f. o. b. Italian port. Correspondence may be in English.

(32,111.) Firm in the Netherlands holding interests in rubber plantations desires to purchase and secure an agency for machinery and tools in general for Dutch East Indian rubber plantations. Quote c. i. f. Netherlands ports and f. o. b. San Francisco for Dutch East Indies. Payment against documents.

(32,138.) A mechanical engineer from Switzerland desires to secure an agency in that country for belting, automobiles and accessories and tires.

(32,146.) A company of electrical goods dealers in Czechoslovakia wishes to purchase and secure an agency for insulated wires, and rubber for technical purposes. Catalogs requested. Cash, United States currency. Correspondence in Czech or German.

(32,158.) A commercial chemist in England desires to secure an agency for medicated rubber adhesive plasters and similar articles of druggists' sundries.

(32,162.) Commercial agent in Italy wishes an agency for the sale of pneumatics and automobile and motorcycle accessories. Quote c. i. f. Geneva or Naples. Payment against documents. Correspondence may be in English.

(32,194.) Merchant in Belgium wishes to purchase or to secure an agency for the sale of men's india rubber collars. Correspondence and catalogs should be in French.

(32,262.) A manufacturer in South Africa desires to purchase waterproof canvas for coaches. Quote f. o. b. New York. Payment through bank against documents.

(32,274.) A company in Greece wishes to buy dental rubber. Correspondence in French or modern Greek.

(32,275.) Importer in Argentina desires agency for the sale of rubber goods, and oiled and waterproofed clothes. Correspondence may be in English.

(32,315.) Commercial agent in British West Africa desires to represent manufacturers in the sale of automobile tires.

(32,311.) Firms in Palestine and Egypt wish to secure agencies for the sale of rubber overshoes. Quote c.i.f. ports of Palestine.

(32,328.) Commission agent and wholesaler in Syria desires to communicate with exporters of rubber goods.

(32,331.) A firm in Norway desires to purchase rubber and rubber goods. Quote f.o.b. American port or c.i.f. Norwegian port. Payment through banks.

(32,349.) A firm of importers in Syria wishes to communicate with exporters of rubber shoes, rubber and rubber goods.

JUDICIAL DECISIONS.

TUFFORD HEEL PATENTS UPHELD.

RUBBER HEEL MAKERS AND DEALERS have followed with exceptional interest the long struggle in many courts of the I. T. S. Rubber Co., Elyria, Ohio, to establish its sole right to manufacture and market the type of heel invented by John G. Tufford, of Elyria, the patents on which had been assigned to the I. T. S. company. Some of the largest concerns in the rubber trade were made defendants in the lawsuits begun by this company, and the alleged infringers were enjoined from further manufacture and sale of the heels said to be identical with those described in the Tufford letters patent.

Nine favorable decisions were obtained by the I. T. S. company, and one decision was adverse. The company took the latter to the United States Circuit Court of Appeals, and it reversed the unfavorable decision. Defendants in the litigation included the Panther Rubber Manufacturing Co., Boston, Massachusetts, the Fetzer & Spies Leather Co., of Cleveland, Ohio, the Elyria National Rubber Heel Co., Elyria, Ohio, the United States Rubber Co., New York City, H. H. Hackman & Co., Cleveland, Ohio, and the Consolidated Rubber Co. and the Hill Rubber Co., both of Elyria, Ohio.

The Elyria National Rubber Heel Co., after the United States District Court at Cleveland had enjoined it from manufacturing and had declared the Tufford patent valid and having been infringed, took the decision to the United States Circuit Court of Appeals for the Sixth Circuit and an early hearing is expected in that tribunal.

The Tufford patent on the heel is Reissue No. 14,049, and on the mold for making the heel No. 1,177,833, the latter having been granted April 4, 1916. The salient feature of the invention is the "curve," a concavity or part-spherical recess throughout the upper surface of the heel, which characteristic rival concerns are alleged to have duplicated.

Reference to this peculiarity of the heel is thus made in the Tufford patent grant: "When the heel or lift is placed against the flat under surface of a leather or other shoe heel and pressure applied to the resilient heel or lift, a vacuum or suction cup may be formed whereby the heel or lift will be held to the shoe temporarily until the nails can be applied. A further object of the invention is to produce a heel, which, when applied to the shoe, will have a flat tread surface and which may be equipped with fastening devices so located that the heel can be easily trimmed down to the required size."

I. T. S. RUBBER CO. vs. PANTHER RUBBER MANUFACTURING CO.—United States Circuit Court of Appeals, First Circuit. Decided May 29, 1919; rehearing denied, July 23, 1919. Appeal from the District Court of the United States for the District of Massachusetts in the matter of the Tufford patent No. 1,177,833 for making rubber heels.

The decision states distinctly that the device was not anticipated by the Neger mold; that the claim for the particular structure and the method of applying it is valid and was infringed. The decision of the lower court overruled and appeal allowed. ("Federal Reporter," Volume 260, page 934; "The Official Gazette," United States Patent Office, February 17, 1920.)

UNITED STATES RUBBER CO. vs. I. T. S. RUBBER CO.—United States Circuit Court of Appeals for the Sixth Circuit. Decided October 7, 1919. Appeal from a preliminary injunction granted by the District Court in the matter of the Tufford patent.

Decree affirmed with the statement that the infringement question is settled by the Fetzer & Spies Leather Co. decision, except as to one minor point, which is obscured by its wording. While the court does not believe that it makes any difference, it remits that point to the District Court for decision. ("Federal Reporter," Volume 260, page 947.)

FETZER & SPIES LEATHER CO. vs. I. T. S. RUBBER CO.—United States Circuit Court of Appeals for the Sixth Circuit. Appeal from the District Court of the United States for the Eastern Division of the Northern District of Ohio in the matter of the Tufford patent for rubber heels, reissue No. 14,049. Decided October 7, 1919.

Decision states that the delay in applying for the reissue was reasonable; that the Tufford patent is valid as against both the Neger and the Ferguson patents, not only because the Court of Appeals for the First District has so decided, but because the process is original as the Court demonstrates in detail. It also asserts that the real contestant is the Foster Rubber Co. Judgment of District Judge affirmed and appeal disallowed. ("Federal Reporter," Volume 260, page 939; "The Official Gazette," United States Patent Office, February 3, 1920.)

MUNGER vs. FIRESTONE TIRE & RUBBER CO. } UNITED STATES
MUNGER vs. THE B. F. GOODRICH CO. }
Circuit Court of Appeals for the Second District. Decided November 12, 1919.

Decree of District Court, dismissing bills of discovery against the two companies, is affirmed. Louis De F. Munger, inventor of an improvement in pneumatic tires, after the expiration of his patent, brought suit against both companies for infringement, and asked in the bills of discovery that the companies should furnish him with detailed statements regarding their business and profits. The District judge refused to allow this until after the infringement suit had been tried and decided. ("Federal Reporter," Volume 261, page 921.)

MODIFICATIONS OF BRITISH PATENT LAWS.

The term for which British patents are valid is made by the new Patents Act, 16 years instead of 14, and the period within which complete specifications can be lodged and applications with provisional specifications can be filed is extended to nine months instead of six. A patentee who can show that he suffered loss or damage in regard to his patent on account of war conditions may obtain an extension of the time of his patent.

By the new act the patentee at any time after the patent is scaled, may request to have it endorsed with the words "License of Right." An inventor does not prejudice his right to apply for a patent by describing it before a learned society; he must give notice beforehand, however, and must apply for his patent within six months of the reading or the publication of his description.

RUBBER ENTERS INTO THE MAKING OF MANY OF THE EXHIBITS in the Toy Fair recently held at the Hotel Imperial in New York City. The United States Rubber Co. exhibited dolls and animals in red rubber as well as white, while rubber continues to be used as the motive power for toy airplanes and submarines, for stamps, for tires, and other parts of toys.

News of the American Rubber Trade.

DIVIDENDS.

THE Brunswick-Balke-Collender Co., Chicago, Illinois, has declared its quarterly dividend of one and three-quarters per cent, payable April 1 on preferred stock of record March 30, 1920.

The Delton Tire & Rubber Co., Baltimore, Maryland, has declared its regular quarterly dividend of two per cent, payable April 1 on preferred stock of record March 20, 1920.

The Driver-Harris Co., Harrison, New Jersey, has declared its quarterly dividends of one and three-quarters per cent on preferred stock and of two per cent on common stock, for the period ended March 31, payable April 1 on stock of record March 21, 1920.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has declared the following quarterly dividends: Initial, 75 cents per share, payable April 1 on common stock of record March 15, placing stock on twelve per cent rate on the \$25 par value; one and three-quarters per cent, payable June 15 on second preferred stock of record May 31, 1920.

The General Electric Co., Schenectady, New York, has declared its quarterly dividend of \$2 per share, payable April 15, on stock of record March 20, 1920.

The Hodgman Rubber Co., Tuckahoe, New York, declared a dividend of \$1.13 per share, payable February 1 on preferred stock of record January 15, 1920. This stock was issued December 12, 1919.

The Kelly-Springfield Tire Co., New York City, has declared its quarterly dividend of \$1.50, payable April 1, on six per cent preferred stock of record March 15, 1920.

The Keystone Tire & Rubber Co., Inc., New York City, has declared its regular quarterly dividend of three per cent, payable April 1, on common stock of record March 15, 1920.

The National Aniline & Chemical Co., New York City, has declared a quarterly dividend of one and three-quarters per cent for the period ended March 31, payable April 1 on preferred stock of record March 15, 1920.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has declared its quarterly dividend of 75 cents per share on outstanding no par common stock of record February 20, payable March 1, 1920.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has declared its regular quarterly dividends of one and three-quarters per cent on preferred stock and one and one-half per cent on common stock of record March 15, both payable March 31, 1920.

The United Shoe Machinery Corp., Boston, Massachusetts, has declared the following dividends: One and one-half per cent on preferred capital stock and 50 cents per share on common capital stock, both payable April 5 on stock of record March 15, 1920.

NEW INCORPORATIONS.

A. & A. Raincoat Co., The, February 18, 1920 (Massachusetts), \$25,000. Jacob, Charles and Philip Aronson—all of 24 Powelton Road, Dorchester, Massachusetts. Principal office, Boston, Massachusetts. To manufacture, purchase and sell at wholesale raincoats and all other goods of which rubber-bered cloth is a component part.

Ad-Mor-Myer Rubber Co., March 2, 1920 (Delaware), \$10,000. M. L. Horry, M. C. Kelly, S. I. Mackey—all of Wilmington, Delaware. To manufacture rubber appliances.

Aetna Rubber Co., The, May 1, 1919 (Ohio) \$30,000. T. Ferry, president; W. H. Staring, vice-president; A. J. Huston, vice-president; P. T. Slinkard, secretary and treasurer; G. R. McKay, director. Principal office, 811 East 79th street, Cleveland, Ohio. To manufacture high grade electricians' and acid gloves. (Reorganization.)

Associated Tire Stores Corp., January 29, 1920 (Delaware), \$30,000. T. L. Croteau, M. A. Bruce; S. E. Dill—all of Wilmington, Delaware. To manufacture tires, etc.

Auto Outfitters, Inc., February 25, 1920 (New York), \$10,000. D. D. Vogel, G. H. Howard, both of 1105 Bedford avenue, Brooklyn; A. Allenberg, 3 East 44th street, New York City—both in New York. Principal office, Brooklyn, New York. To manufacture tires.

Channel Packing & Rubber Co., Inc., February 26, 1920 (New York), \$50,000. T. P. Hastings, 73 Pineapple street; A. M. Hades, 13 St. An-

drews street—both of Brooklyn; F. J. O'Connor, Hillburn—both in New York. To manufacture rubber goods, engineers' supplies, etc.

Eagle Tire Co., The, November 14, 1919 (Ohio), \$4,000. P. W. Stanley, president; M. Winkler, vice-president; W. Werner, secretary and treasurer. Principal office, 806 Prospect Avenue East, Cleveland, Ohio. To manufacture tires and tubes.

Emery Tire & Rubber Co., January 17, 1920 (Washington), \$60,000. W. A. Emery; C. C. Howell; H. Tarlow. Principal office, 104 23rd Avenue North, Seattle, Washington. To manufacture automobile accessories.

Grayson Automotive Corp., March 9, 1920 (New York), \$20,000. B. Levy; B. Swiryn; S. J. Grayson—all of 403 Amsterdam avenue, New York City. To manufacture automobile tires and tubes.

High Grade Rubber Co., Inc., March 2, 1920 (New York), \$5,000. H. Abrotsky, 382 Watkins street; R. Hammer, 338 Vermont street, both of Brooklyn; W. Jacobs, 299 Broadway, New York City—both in New York. To manufacture tires.

Kentucky Tire & Rubber Association, The, November 13, 1919 (Kentucky), \$1,000,000. H. P. Diddicks, president; W. R. White, executive vice-president; A. E. Peterson, secretary. Principal office, 502 Realty building, Louisville, Kentucky. To manufacture tires.

Ludington Rubber Co., November 8, 1919 (Wisconsin), \$100,000. A. H. Gruber, president and general manager; G. E. Dorrell, vice-president—both of Ludington, Michigan; W. G. Gruber, vice-president; B. G. Hayden, secretary. Both of Milwaukee, Wisconsin; C. D. Moriarty, treasurer, Ludington, Wisconsin. Principal office, 1613 Trust Company building, Milwaukee, Wisconsin. Factory, Ludington, Michigan. To manufacture tire casings.

Maurice Tire & Rubber Co., The, February 21, 1920 (Ohio), \$25,000. G. Seydrist, president and general manager; 1912 Jefferson avenue, Toledo; R. Butler, vice-president and superintendent of production, 116 Park avenue, Barberton; C. F. Weissenberger, secretary and treasurer, 2133 Vermont avenue; J. B. Patterson, sales director, 100 West Bancroft street—both of Toledo—all in Ohio. Principal office, 705 Madison avenue, second floor, rear suite, Toledo, Ohio. To manufacture, buy, sell and deal in rubber tires and inner tubes for automobiles or other vehicles.

Mohave Valley Amalgamated Tire Stores Corp., March 16, 1920 (New York), \$24,000. Stanley and Arthur Newman; G. J. Bates—all of 1934 Broadway, New York City. To manufacture tires, etc.

Montford Tire Rubber Co., December 5, 1919 (Oklahoma), \$150,000. E. C. Osborn; L. Smilie; H. L. McCracken—all of Oklahoma City, Oklahoma. Principal office, Oklahoma City, Oklahoma.

New Haven Rubber Mould & Equipment Co., March 10, 1920 (Connecticut), \$100,000.

Northwestern Motor Supply Co., January 20, 1920 (Wisconsin), \$25,000. W. Williams and K. M. Schaefer, both of Milwaukee. Principal office, Superior, Wisconsin. To deal in all kinds of motor and automobile accessories, etc.

On-Tube Tire Filler Co., Inc., August 30, 1919 (New York), \$100,000. W. J. Gallagher, president and treasurer; D. S. Rose, vice-president; K. T. Gallagher, secretary. Principal office, 789 Eleventh avenue, New York City. To manufacture tire fillers.

Palmer Tire Corp., January 22, 1920 (Delaware), \$500,000. M. L. Rogers; T. A. Irwin; W. G. Singer—all of Wilmington, Delaware. To manufacture rubber tires, etc.

Polish American Rubber Mfg. Co., February 24, 1920 (Delaware), \$2,000,000. T. L. Croteau; M. H. Blaskie; S. E. Dill—all of Wilmington, Delaware.

Quinn-Treiber Corp., March 16, 1920 (New York), \$10,000. J. T. and L. M. Ouplan—both of Lynbrook; J. P. Treiber, 97 Chauncey street, Brooklyn—both in New York. To manufacture tires, etc.

Rapallo & Robbins, Inc., March 18, 1920 (New York), \$100,000. G. Rapallo, S. B. Robbins, A. Volz—all of Jamestown, New York. Principal office, Jamestown, New York. To manufacture tires and automobile accessories.

Record Sales Co., February 28, 1920 (New York), \$100,000. W. W. Griffin, 14 Church street; C. B. Cler, 280 Broadway, both of New York City; W. F. Severn, 636 Eastern Parkway, Brooklyn—both in New York. Principal office, 14 Church street, New York City. To sell tires, tubes, etc.

Reinold-Kie & Rubber Co., Inc., March 12, 1920 (New York), \$50,000. M. P. Dennis, P. M. Tonn, A. Fay—all of 112 West 23rd street, New York City. To manufacture auto tires and rubber goods.

Re-Nu Tire & Rubber Co., Inc., March 4, 1920 (New York), \$10,000. G. Snyder, 221 Madison avenue; G. E. Fink, 200 Madison street, both of New York City; J. Messner, 1182 Putnam avenue, Brooklyn—both in New York. To rebuild old auto tires, etc.

Rochester Webbing Corp., March 16, 1920 (New York), \$50,000. W. D. Smith, 12 Kensington street; E. B. Rochester, A. C. Patterson, Fairport, both in New York. Principal office, East Rochester, New York. To manufacture woven fabrics, auto supplies, etc.

Rub-Tex Products, Inc., March 1, 1920 (Indiana), \$750,000. S. C. Lange, treasurer and general manager; L. E. Kuhn, general superintendent and production manager. Principal office, 454 Lemcke Annex, Indianapolis, Indiana. To manufacture rubber goods, etc.

Rubber Corp. of America, March 10, 1920 (Delaware), \$2,000,000. T. L. Croteau, M. A. Bruce, S. E. Dill—all of Wilmington, Delaware.

Seyville & Trevors, Inc., March 22, 1920 (New York), \$10,000. Walter A. and Agnes M. Seyville, both of 65 Guernsey street; G. A. Trevors, 703 Manhattan avenue—all of Brooklyn, New York. Principal office, Brooklyn, New York. To deal in tires.

Simplex Rubber Co., February 18, 1920 (Massachusetts), \$50,000. G. F. Quinn, Beschoff; W. F. Kilip, 134 Bellingham avenue, Revere; A. T. Parsons, 39 State street, Boston—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in rubber, rubber goods and products.

Simpson Universal Tire Co. of New York, February 26, 1920 (New York), \$300,000. A. Simpson, A. Goetz, A. G. Gault, Jr.—all of Richmond Hill, New York City. Principal office, Jamaica, New York.

Smith Tire Corp., March 9, 1920 (Delaware), \$16,500,000. G. V. Reilly, S. B. Howard, R. K. Thistle—all of New York. To manufacture automobile tires, tubes, etc.

Tantor Trading Co., Inc., January 15, 1920 (New York), \$60,000. S. Taintor, president; W. Boyd, vice-president; J. Steel, treasurer; E. A. Stethers, secretary. Principal office, 9 State street, New York City. To do a general trading business.

Trans-Continental Tire & Rubber Co., Inc., February 27, 1920 (New York), \$30,000. W. W. Lesselbaum, J. Druss, F. Liscinson, all of 128 Broadway, New York City. To manufacture tires.
 United Tire Stores Co., Inc., March 6, 1920 (Delaware), \$10,500,000. T. L. Croteau, M. A. Bruce, S. E. Dill, all of Wilmington, Delaware. To manufacture and sell tires.
 Unsmokable Life Saving Suit Co., Inc., March 10, 1920 (New York), \$5,000. W. T. McCoy, 216 West 138th street; C. Mardenbro, 312 West 9th street; R. Washington, 427 West 5nd street, all of New York City. To manufacture rubber suits, etc.

REPUBLIC RUBBER CORPORATION'S NEW PRESIDENT.

E. F. JONES, recently elected president of The Republic Rubber Corporation and the Republic Rubber Co., Youngstown, Ohio, succeeding Guy E. Norwood, resigned, brings to the company

thirty years of practical experience in the manufacturing field.

For ten years Mr. Jones was identified in various responsible capacities with the Illinois Steel Co.; then for a twelve-year period with the International Harvester Co., which he served in all departments; later with the Morgan Spring Co. and National Manufacturing Co.; next as president of the Clinton-Wright Wire Co., Worcester, Massachusetts, and more recently as vice-president and general manager of

E. F. JONES.

the Elyria Iron & Steel Co., Cleveland, Ohio.

The majority of the directors of The Republic Rubber Corp. consists of iron and steel manufacturers in the Youngstown district, which accounts in a measure for the election of Mr. Jones. He has, however, established a reputation as a capable executive,

organizer and business man of exceptional ability that renders his acquisition most fortunate. It is taken to mean the beginning of a new era in the history of the company.

THE REPUBLIC RUBBER CORPORATION.

THE REPUBLIC RUBBER CORPORATION had its first start nearly twenty years ago when a rubber manufacturing company was organized at Youngstown, in Mahoning County, Ohio, largely through the exertions of John Scott McClurg, who became the manager. It was incorporated as the Mahoning Rubber Co. on February 28, 1901, but by the end of the year it had been found advisable to change the name, and it became the Republic Rubber Co. on December 2.

The capital of \$400,000 was easily raised locally as Youngstown hoped to be able to rival its neighbor, Akron, in the rubber industry. The Wick family was interested in the enterprise, and after H. W. Wick, the first president, resigned, his son-in-law, Warner Arms, was elected in his place and held that office until his death in 1910.

From the start the company manufactured rubber goods of all descriptions, fire hose, balata belting, mechanical goods, and molded goods. By 1905 it had taken up tires, both solid and pneumatic. Other specialties of the company were the side wire wheel and golf balls. In that year the capital was increased to \$1,000,000. The business continued to expand rapidly, and in 1912 under Thomas L. Robinson, Mr. Arms' successor as president, the capital was increased to \$10,000,000.

The spread of the business made it advisable to establish subsidiary companies in various parts of the country, so that when the company was reorganized in 1917, it included the Republic Rubber Co. of New York in New York City; of Massachusetts at Boston; of California at San Francisco; of Texas at Dallas; of Pittsburgh, and the Republic Rubber Co., Inc., at London, England.

On October 6, 1917, the business of the company was taken over by the Republic Rubber Corp., incorporated under the laws of New York with a capital of \$11,250,000. The plant at Youngstown then covered 45 acres, with buildings containing 15 acres of floor space, where rubber goods of all kinds were manufactured and 3,000 tires could be turned out daily. With it was then amalgamated the Canton Blackstone Co., which had been the Knight Tire & Rubber Co., of Canton, Ohio, with seven acres

PLANT OF THE REPUBLIC RUBBER CORPORATION, YOUNGSTOWN, OHIO.

of ground, four acres of floor space and the capacity to turn out 1,000 tires a day. The company was incorporated in Ohio in June, 1911, and was amalgamated with the Republic company in 1917; its name was changed to Canton-Blackstone in April, 1919.

In May, 1917, Guy S. Norwood succeeded Mr. Robinson as president of the Republic Rubber Co., coming from The B. F. Goodrich Co. to take the position. The other officers of the corporation were: L. T. Petersen, Harvel J. Woodward and W. W. Roe, vice-presidents; C. F. Garrison, secretary, and M. I. Arms, 2nd, treasurer.

In February, 1920, E. F. Jones was elected president to succeed Guy E. Norwood who resigned. The names of the other officers recently elected will be announced later.

ANNUAL REPORT OF THE B. F. GOODRICH CO.

Sales for the calendar year 1919 were the largest in the history of The B. F. Goodrich Co., Akron, Ohio, aggregating \$411,343,419, on which the company earned net profits amounting to \$17,304,813, after making the usual charges for maintenance, depreciation, bad debts and other items, but before making allowance for such Federal income and excess profit taxes as may be finally determined. In 1918 the sales totaled \$123,470,187, and in 1917, \$87,155,072.

In consequence of this greatly increased business the dividend on common stock has been advanced from a \$4 to \$6 per annum basis beginning with the February, 1920, dividend. Sales have been limited only by the ability to produce, and when the additional manufacturing facilities now under construction are brought into production this year, the annual business may exceed \$200,000,000.

The consolidated balance sheet, profit and loss, and surplus accounts for the year ended December 31, 1919, are as follows:

CONSOLIDATED BALANCE SHEET.

ASSETS.			
Capital Assets:			
Real estate, buildings, plant, machinery and sundry equipment, less reserve for depreciation of \$7,365,875.97, including special reserve, per balance sheet, December 31, 1918, of \$1,447,540.22 applied as obsolescence for years 1918-1919.	\$19,486,065.22		
Patents and trade-marks.	1.00		
Goodwill.	57,798,000.00	\$77,284,066.22	
Investments and Advances to Other Companies.		\$331,360.93	
Foreign Associated Companies, etc., representing the net investment at December 31, 1919.		6,054,451.19	
19,060 Shares of 7 Per Cent Cumulative Preferred Stock in Treasury at par.		1,906,600.00	
Current Assets:			
Raw materials, partly manufactured and finished stock.	\$54,184,974.63		
Trade accounts receivable, after deducting reserve to cover doubtful accounts, discounts and allowances.	23,011,543.22		
Other accounts receivable.	350,208.24		
Accounts receivable.	44,688.24		
United States Liberty Loan Bonds, at market prices.	2,591,535.32		
Cash in banks and on hand.	5,491,500.07		
		85,874,449.72	
Deferred Charges to Future Operations:			
Prepaid insurance, interest, taxes, etc.		1,264,990.25	
		\$175,715,918.31	
LIABILITIES.			
Capital Stock:			
600,000 shares of common stock of the par value of \$100 each.	\$60,000,000.00		
450,000 shares of 7 per cent cumulative preferred stock of the par value of \$100.00 each.	\$45,000,000.00		
Deduct—\$4,000 shares of preferred stock redeemed and cancelled, including \$900,000 deemed during 1919.	5,400,000.00	39,600,000.00	\$99,600,000.00
100,000 shares of 7 per cent cumulative preferred stock of the par value of \$100.00 each, authorized and Unissued.		\$10,000,000.00	
Current Liabilities:			
Bills payable—general.	\$22,068,000.00		
Bills payable—secured—deposit of portion of United States Liberty Loan Bonds, per contract.	2,000,000.00	\$24,068,000.00	
Accounts payable.	5,864,069.30		
Sundry accrued liabilities.	1,255,739.23		
		31,187,808.53	

RESERVE TO:			
Contingencies.	\$2,000,000.00		
Pension.	500,000.00		
Amortization of war facilities.	1,225,063.73		
		\$3,725,063.73	
Surplus (per annum account), here previous Federal income and war excess profits taxes as may be finally determined.			4,055,401.11
Contingent Liabilities:			
Bankers loans to employees, secured by deposit of stock of this company, purchased by them, and by the guarantee of the company.	956,891.36		
			\$175,715,918.31

(The common stock dividend of 1 per cent, declared October 15, 1919, payable February 16, 1920, has not been deducted from the surplus shown above.)

PROFIT AND LOSS ACCOUNT.

Net sales.	\$41,343,419.45
Deduct—Manufacturing, selling and general administrative expenses.	\$21,579,265.35
	\$19,764,154.10
Add—Miscellaneous income.	720,660.24
	\$20,344,214.44
Deduct:	
Provision for depreciation.	\$1,835,336.77
Interest on bills payable, etc.	1,199,861.94
	\$3,035,208.71
Net profit (before providing for such Income and Excess Profits Taxes as may be finally determined), carried to surplus account.	\$17,304,813.31

SURPLUS ACCOUNT.

Balance, January 1, 1919.	\$1,329,987.18
Less reserve for amortization of war facilities.	1,225,063.73
Total.	\$1,104,923.45
Add—Net profit for the year ended December 31, 1919.	17,304,813.31
Premium and accrued dividends received on sale of 150,000 shares of additional preferred stock issued.	387,000.00
	\$18,696,736.98
Deduct—7 per cent dividend on preferred stock (Nos. 28 to 31 inclusive) for the year ended December 31, 1919.	\$2,247,000.00
4 per cent dividend on common stock (Nos. 16 to 19 inclusive) paid during 1919.	2,400,000.00
Reduction of preferred stock purchased, from cost to par.	77,778.46
Additional appropriation for pension fund.	10,000.00
Income and war excess profits taxes paid during the year, applicable to 1918 earnings.	\$1,158,412.47
	\$1,383,690.93
	\$41,203,046.05

STATEMENT OF HOOD RUBBER COMPANY.

Hood Rubber Company's sales for the 1919 calendar year totaled \$22,969,664, compared with \$22,341,081 in 1918, \$18,573,765 in 1917, \$11,666,501 in 1916 and \$9,083,693 in 1915. Of 1919 total sales, \$6,593,984 was from tires, compared with \$4,834,925 in 1918.

Balance sheet as of December 31, 1919, compares with the two previous years as follows:

	1919	1918	1917
Plant, real estate, machinery, etc.	\$4,200,000	\$4,000,000	\$4,000,000
Merchandise.	7,156,022	8,012,862	4,075,021
Accounts receivable.	3,111,907	1,302,000	4,325,933
Cash.	1,084,348	1,025,878	930,680
Investments in other corporations.	410,400	285,400	284,400
Patents.	1,000	1,000	1,000
Liberty Bond accounts.	103,404	521,020	12,297
Total.	\$16,067,081	\$15,045,520	\$13,748,131
Capital stock common.	\$3,000,000	\$3,000,000	\$3,000,000
Preferred.	5,000,000	4,000,000	4,000,000
Notes payable.	4,800,000	4,725,000	4,150,000
Liberty Bond account.	343,128	505,000	85,840
Accounts payable.	2,863,953	2,666,005	1,212,111
Surplus.			
Total.	\$16,067,081	\$15,045,520	\$13,748,131

The treasurer's report states that earnings for 1919 were less than the three years previous, as prices of footwear were lower and costs higher in 1919 than in 1918. Prices on footwear were advanced on January 1, 1920, and this increased margin, together with the increased efficiency of the factory and the economy of the Hood Rubber Products Co. should show satisfactory earnings for 1920. Net quick assets have increased from about \$5,400,000 on December 31, 1918, to about \$6,252,000 on December 31, 1919.

THE ADVANCE IN TIRE PRICES.

The long anticipated rise in the price of tires has gone into effect. It became inevitable when the shortage in the necessary quantities of cotton, and the resultant inability to manufacture in sufficient quantities the fabrics made from it, became known. The increase in tire prices would have been made last October had it not been for the foresight of many companies, which secured supplies for some months ahead. Another cause for higher prices is the reduction in tire prices which many large companies made last spring so that in some cases the present increase merely restores the prices that prevailed before May.

One of the largest tire companies, by increasing the price of both fabric and cord casings 17½ per cent, restores the prices it charged before May; its plain tread fabric tires are 10 per cent below the price of fabric and cord casings, and 5 per cent below their rib-tread cord casings. Tubes have been advanced 15 per cent, motorcycle casings and tubes 20 per cent, cord pneumatic truck tires and tubes 20 per cent, solid and cushion tires from 10 to 15 per cent.

Other large companies have made advances such as these: fabric casings, 18 per cent; cord casings, 20 per cent; gray tubes, 10 per cent; red tubes, 7½ per cent; fabric and cord tires, 17½ per cent; red and gray tubes, 15 per cent; plain tread fabric tires, 25 per cent; fabric non-skid, 17½ per cent; plain fabric, 25 per cent; ribbed cord, 10 per cent; non-skid cord, 8 per cent; tires and tubes, 15 per cent.

Apparently one-sixth of the former price has been added on the average to the cord and fabric tires and from one-tenth to one-eighth to that for tubes.

PERSONAL MENTION.

William S. Bloomer has been appointed Chicago district manager of the Quaker City Rubber Co., Philadelphia, Pennsylvania.

R. W. Ashcroft, who recently resigned as advertising manager of the United States Rubber Co., New York City, a position he had held for the last four years, and previously advertising manager of the Canadian Consolidated Rubber Co., Limited, Montreal, has been appointed director of publicity of the Ames Holden McCready System in the latter city.

A. C. Frank, export manager of the Firestone Tire & Rubber Co., Akron, Ohio, recently returned to New York City after a three-months trip to England and the Continent. He reports that the industrial activity of Belgium is particularly noticeable and that that country is now rapidly placing its factories on a quantity production basis and rehabilitating the devastated districts.

Robert S. de Orrell, formerly of the Hartford Rubber Works Co. and the Lee Tire & Rubber Co., has been appointed superintendent of the Washington Tire & Rubber Co., East Sprague avenue, Spokane, Washington.

J. B. Cothran, who was recently appointed manager for the Globe Rubber Tire Manufacturing Co.'s New York district, is one of the most popular men in the tire business. His headquarters will be 1851 Broadway, New York City.

Fred B. Geary, who was succeeded by J. B. Cothran, has been advanced to the position of general factory representative.

Charles W. Wood, crude rubber broker, 149 Broadway, New York City, who was successfully operated on last month, is rapidly convalescing.

E. S. Benson, formerly of Detroit, Michigan, has been appointed manager of the New York City office of The Fisk Rubber Co., Chicopee Falls, Massachusetts, and assumed his new duties March 1. His headquarters are at 1725 Broadway.

E. B. Tozier has resigned as secretary and general manager of the Century Rubber Works, Chicago. He is now at 1307 Rector Building, Chicago.

Henry S. Kimball and W. H. Swift have been elected vice-presidents of Gaston, Williams & Wigmore, Inc., international merchants, 39 Broadway, New York City.

George H. Lincks, who has been in the employ of William H. Scheel, 159 Maiden Lane, New York City, for the past 31 years as chief of staff with full charge of the buying and selling, has resigned and will conduct a general chemical business under the name of George H. Lincks at 106 Wall Street, New York City.

Robert Allan, formerly manager of the London & Brazilian Bank at Pará, Brazil, is now with the American Mercantile Bank of Brazil, Inc., at Pará.

W. J. Harris and G. E. James, of the Avon India Rubber Co., Limited, Melksham, Wilts, England, were recently in the United States on the company's business.

F. O. Holbrook of the Isleworth Rubber Co., Limited, Isleworth, Middlesex, England, has been in the United States for several weeks in the interest of his company.

D. MacArthur is now in the United States on a business trip in the interest of the North British Rubber Co., Limited, Edinburgh, Scotland.

J. Alfred Corbiy has recently joined the sales force of Tyler Rubber Co., Andover, Massachusetts. Mr. Corbiy was formerly with the Gates Rubber Co., Denver, Colorado, and will cover the Middle Atlantic States.

AN INCREASED PRODUCTION CONVENTION.

Seeing in increased production a means of restoring normal business and price conditions, the Chamber of Commerce of the United States will make its eighth annual meeting, to be held at Atlantic City, New Jersey, April 27 to 29, 1920, an "Increased Production Convention."

The general subject of increased production has been divided up in the program for the convention into sub-subjects. The first to be taken up will be the government in relation to production. Under this heading will be considered anti-trust legislation and taxation, especially the subject of excess profits taxes, against which there has been general complaint. The second general subject to be taken up will be land and water transportation in relation to production. International finance and its relation to world production will be discussed from the point of view of both the financier and the business man.

One general session of the convention will be given over to agriculture in relation to production and another important general subject will be the relation of labor to production.

Besides the general sessions there will be held group meetings, divided as along the great division of industry. In these meetings the subject of increased production, as in the general meetings, will be the main topic discussed.

ANNUAL MEETING OF NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

The annual meeting of the National Association of Waste Material Dealers was held at the Hotel Astor, New York, March 15 to 17, 1920. The Scrap Rubber Division met on the 15th and chose as chairman for the ensuing year Nat E. Berzen, of the New York firm of the same name.

Aside from an examination into the conditions the scrap rubber and rubber reclaiming industry is facing, the meeting concerned itself with drafting two resolutions designed to expedite business. The first provided that interest be charged reclaimers on all overdue accounts, and it was voted that a copy of this resolution be sent to all members of the Reclaimers' Division of The Rubber Association of America, as well as to reclaimers outside of this body.

The second resolution provides that the railroads be asked to change the carload rating on scrap rubber shipments from fifth to sixth class. In the movement to bring this about the secretary was ordered to cooperate with the Reclaimers' Division of The Rubber Association of America, Inc.

EASTERN AND SOUTHERN NOTES.

By Our Regular Correspondent.

THE RUBBER TRADING Co., 9-15 Murray street, New York City, announces that after March 22 it will do business under the corporate name of Baird Rubber & Trading Co. The officers are: William T. Baird, president and treasurer; Robert B. Baird, chairman of board; Collier W. and Robert D. Baird, vice-presidents; William T. Baird, Jr., secretary.

The Morse Chain Co., Ithaca, New York, has opened a new office at 1402 Lexington Building, Baltimore, Maryland, in charge of E. R. Morse, manager, and one at 302 Harrison Building, Philadelphia, Pennsylvania, in charge of M. H. Rodd, manager.

The Madison Tire & Rubber Co., Inc., has purchased the building at 20 West 60th street, New York City, and is remodeling it for a show-room and executive offices which it will occupy after May 1.

The Roessler & Hasslacher Chemical Co. will remove on April 1 from 100 William street to more commodious quarters at 709-717 Sixth avenue, corner of 41st street, New York City. Mail should be addressed to postoffice box No. 119, Times Square Station.

MacArthur & White, Inc., crude rubber brokers, with offices at 150 Nassau St., New York City, and Guth-Otis Building, Akron, Ohio, is a recently organized concern, although the members are well known crude rubber men. William MacArthur, who was recently associated with Hardy & MacArthur, will be in charge of the New York office, assisted by C. J. Lockhorn. A. R. White, who was formerly with J. T. Johnstone & Co., will have charge of the Akron office, and be assisted by Stuart Brown.

Hummel & Robinson, New York City, exporters, importers, and manufacturers of chemicals for the rubber trade, have appointed W. R. Sturges their representative and agent in southern territory for the sale of dry colors and chemicals. Mr. Sturges has been with Reichard-Coulston, Inc., New York City, in the same line of business, for the last seven years.

The Bargain Tire Co., incorporated in New York in 1917, to repair tires, etc., at 200 West 111th street, has been dissolved under the laws of that state.

The world's largest manufacturer of lead pencils is the Eagle Pencil Co. of New York City. The products of the company include every variety of pencil known to the trade, as well as rubber erasers, fountain pens, penholders and a multiplicity of styles of steel pens for every requirement. In ordinary pencils alone the daily output amounts to ten gross, practically 1,500 each minute. The Blaisdell paper pencil company has recently been acquired by the Eagle company and this line added to the output. One of the many departments of the Eagle plant is that devoted to making rubber erasers in various forms and colors.

The Henderson Tire Export Co., Inc., has opened offices at 17 West 42nd street, New York City, in addition to its new factory at Columbus, Ohio. The officers are C. Bernard Schmolle, president; W. H. Queripel, vice-president and treasurer; C. O. Henderson, of the Henderson Tire & Rubber Co., vice-president, and P. A. Zizelman, secretary. They will construct the Henderson millimeter tire, with special reference to the foreign market.

Under the auspices of the State and City of New York, the Firestone film, "Careless America," was recently shown to more than 5,000 school children at the Capitol Theatre, New York City, as the opening wedge in a nation-wide "Safety First" campaign.

The film was made by the Universal Film Co. for Harvey S. Firestone, who is seeking to impress upon Youthful America the dangers of careless pedestrianism, and upon automobilists,

the evils of reckless driving. It depicted distressing accidents and gave the A. B. C.'s (Always Be Careful) of "Safety First."

Laidlaw, Kelley & Co., Inc., 14 Platt street, New York City, importer, exporter, and manufacturers' agent, has acquired a 21-year leasehold on the seven-story and basement building at the southwest corner of Thompson and Grand streets, and will consolidate there its various departments now located in several downtown buildings.

The Century Rubber Stamp Works, Inc., 551 Pearl street, New York City, has been formed from the partnership started eight years ago by a number of men who had been in the rubber stamp business from 18 to 30 years. Harry Heine is president.

The National Aniline & Chemical Co., Inc., 21 Burling Slip, New York City, has elected the following directors: Orlando F. Weber, H. H. S. Handy, W. N. McIlravy, Dr. W. G. Beckers, L. C. Jones, C. S. Lutkins, Henry Wigglesworth, W. J. Matheson, T. M. Rianhard, Dr. R. C. Taggesell, and F. M. Peters. The number of directors has been reduced to twelve. The directors, in turn, have appointed the following officers: president, chairman of the board, and chairman of executive committee, O. F. Weber; vice-presidents, Dr. W. G. Beckers, J. W. Newlan; acting treasurer, William H. West; secretary, H. F. Atherton; assistant treasurers, H. S. Trott, T. S. Baines; assistant secretary, R. V. Mahon.

The Katzenbach & Bullock Co., Inc., 100 William street, New York City, has bought the six-story and basement building at 440 Washington street, into which the company plans to move about April 1. The first and second floors will be used for offices; the balance for storage, laboratory, testing rooms, etc.

The Rubber Industries Athletic League of New York City held its first annual entertainment and reception at the Central Opera House, 67th street and Lexington avenue, New York City, March 23, which included a vaudeville performance and a ball. More than fifteen rubber companies were represented in the large attendance.

The Rubber Products Co., Barberton, Ohio, has appointed H. P. Harding eastern district manager.

The Rubber Engineering Co., Akron, Ohio, has appointed W. S. Innes its representative, with offices at 72 Trinity Place, New York City.

The Sydecan Rubber Co. has moved from 225 Fourth avenue to 222 Fourth avenue, New York City.

The Eckrode Rubber Co., Inc., Newark, New Jersey, has appointed Harold L. Pettigell its eastern and southern district manager. He was formerly with the Ajax Rubber Co., Inc., New York City, as assistant manager for two years, and previous to that was special representative of the Lee Rubber & Tire Co. for four years.

The General Electric Co., Schenectady, New York, will build in that city a six-story addition to its plant, 54 by 219 feet, to cost approximately \$400,000.

The plant of the former Kavanaugh Knitting Co., Waterford, New York, has been acquired by the Beaver Mills, North Adams, Massachusetts. The latter manufacture yarn and tire fabric and the new mill is being adapted for the manufacture of tire yarns and will produce fabric the latter half of this year.

The Achilles Rubber & Tire Co., Inc., Binghamton, New York, has added another floor to its former three-story factory, enlarged the vulcanizer room, erected a new one-story warehouse, 40 by 80 feet, and built a new structure, 60 by 100 feet, for the storing of rubber, washing and drying rubber, cement mixing, and spreading. A larger building for the manufacture of tires and tubes is to be built as soon as the weather permits, to cost \$600,000. The present factory will then be used for the manu-

facture of rubber footwear. Harry J. Smith is president and A. W. Caney vice-president.

The Lehigh Tire & Rubber Co., Pottstown, Pennsylvania, has changed its name to the Vulcaweld Tire & Rubber Co. J. A. Maney is secretary.

The London Rubber Co., Pittsburgh, Pennsylvania, has elected the following officers: A. L. London, president; C. M. London, vice-president; H. London, secretary and treasurer.

The Union Rubber and Asbestos Co., Warren, Pennsylvania, has been incorporated under the laws of New Jersey to manufacture, buy, and sell mechanical rubber goods and asbestos materials. Donald W. Mackie is president; J. M. Shear, vice-president; Harry M. Prill, treasurer; and Charles H. Swoger, secretary; directors—R. A. Mackie, J. E. Golden, Thomas Flynn, and E. G. Cottingham. The personnel includes men familiar with the rubber needs of the oil field industry.

The Corona Cord Tire Co., East Butler, Pennsylvania, has removed the machinery in the buildings which it purchased in September last on the 20-acre property near Butler, and has progressed with the installations of its own machinery to the point where it hopes to begin production of tubes in February and of cord tires in March, to which line it will confine its business. The officers are: Thomas Phillips, Jr., president; H. B. Callahan, vice-president; C. H. Miller, secretary-treasurer. The directors include, in addition to the foregoing, J. V. Ritts, Elias Ritts, B. D. Phillips, and A. C. Fisher.

The New Castle Rubber Co., New Castle, Pennsylvania, is greatly increasing its facilities for the manufacture of fabric and cord tires and inner tubes. Many changes are being made at the company's plant at Mahoningtown and modern equipment is being installed. A new executive office is under construction and will be ready for occupancy this spring. Over 1,200 tires per day are being manufactured at present.

The officers are F. A. Krusemark, president; H. G. Carpenter, vice-president; L. G. Funkhouser, general manager, and F. T. Hutson, secretary-treasurer.

The Kelley Tire and Rubber Co., Inc., 962 Chapel street, New Haven, Connecticut, is excavating for its plant to be built at West Haven, on the line of the New York, New Haven & Hartford railroad. It is expected that the office building will be completed in April. All machinery and equipment for building 500 "Kelley King of Kord" tires and 1,000 tubes daily has been purchased and orders are being taken for delivery on July 1.

The Norwalk Tire & Rubber Co., Norwalk, Connecticut, is building an addition to its plant, 158 by 83 feet, six stories high, which it expects to occupy within a month. The construction is brick with steel frame.

The McClaren Rubber Co., Charlotte, North Carolina, has appointed the McClaren Rubber Tire Co., 327 West 57th street, New York City, its distributor.

The Diamond Holfast Rubber Co., 33 Auburn avenue, Atlanta, Georgia, will build a rubber plant to cost approximately \$1,000,000 and will increase its capital to \$2,500,000. H. Diamond is president.

The Virginian Rubber Co., Charleston, West Virginia, is building and has about half completed its two-story brick and concrete factory building, 100 by 200 feet, and a power house 50 by 40 feet, has been almost finished. The total cost will be about \$275,000, and the company will manufacture both cord and fabric tires. Operation about June 1 is expected. The officers are: A. A. Lilly, president; Houston G. Young, vice-president; W. D. Guyer, secretary and treasurer; E. P. Stroman, general manager and T. A. Conger, general superintendent, formerly with the Henderson Tire & Rubber Co., at Bucyrus, Ohio.

The Kentucky Tire & Rubber Association, Louisville, Kentucky, newly incorporated for the purpose of manufacturing "Blue Grass Kord" tires, has temporary executive offices at 502-503 Realty Building. The construction of the first unit of its factory will be started at an early date. This will be 60 by 400 feet, part two stories high, and will be located on the K. & I. railroad.

The officers of the new company are: H. P. Diddiksen, president; W. R. White, executive vice-president; J. E. Peterson, secretary; directors: H. J. Huff, Perry Frantz, O. R. Peterman, A. D. Hite, and J. W. Cambron.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON NOTES.

THE RECENT FRESHET in the streams of this section caused a serious loss to the Empire Rubber & Tire Corp., situated on the Assumpink creek and necessitated closing the plant for more than a week. The boiler rooms and lower floors of the works were flooded and generators, motors, etc., were badly damaged by water. When the plant was finally put into shape for operation a second freshet caused further damage and the works closed again. The loss from the two freshets will total many thousand dollars. Apart from stock and machinery damage the company has lost heavily in curtailed production. The tire department on the lower floor is where the water did the most damage. The Joseph Stokes Rubber Co. was also flooded, causing the works to close down at a loss of several thousand dollars. The Crescent Belting & Packing Co. also suffered a considerable loss. The Bergougnan Rubber Manufacturing Co. was closed down for a day because the employees were unable to reach their work, due to the blizzard stopping the trolley lines.

Mayor Frederick W. Donnelly plans to prevent the future flooding of the rubber plants along the shores of the Assumpink Creek by the building of a long retaining wall. A conference was held between the mayor and representatives of the Puritan Rubber Manufacturing Co., Empire Rubber & Tire Corp. and the Joseph Stokes Rubber Co. The proposed wall will contain 17,000 feet of material and will cost about \$150,000. The expense will be borne equally between the rubber manufacturers and the city of Trenton. C. Edward Murray, Jr., second vice-president of the Empire Rubber & Tire Corp., was made a member of the committee in charge.

Everything in the rubber line from tires to small hose has been advanced in price by Trenton manufacturers during the past month and prices will remain up for some time. There had been a general advance along all lines. The increased rates are due chiefly to the higher cost of cotton fabric, which has trebled in price during the past year. Compounding ingredients have also advanced materially. While there had been an increase in the cost of labor during the year, the advanced prices of manufactured goods are principally due to the cost of raw materials.

The plant of the Nearpara Rubber Co., East Trenton, was destroyed by fire on March 17, causing a loss of several thousand dollars. Herman Rosenthal, the proprietor, announces that he will build a new plant. Considerable stock was burned. The building was of frame construction, 125 by 60 feet in size.

The winter home of George R. Cook, situated at Camden, South Carolina, was recently destroyed by fire, including all the household goods. The cause of the blaze is unknown and the loss is very heavy. Mr. Cook is president of the Acme Rubber Manufacturing Co., and the Hamilton Rubber Manufacturing Co., both of Trenton.

W. O. Rutherford, vice-president of The B. F. Goodrich Rubber Co., Akron, Ohio, was entertained recently at dinner at the Trenton Club by John S. Broughton, president of the United

& Globe Rubber Co., Trenton. A number of Trenton rubber manufacturers were present. Following the report Mr. Rutherford visited several of the Trenton rubber plants and the points of historic interest in old Trenton.

John A. Lambert, treasurer and general manager of the Acme Rubber Manufacturing Co., has been elected president of the Trenton Chamber of Commerce at its annual reorganization meeting. Mr. Lambert was first vice-president of the organization and also chairman of the manufacturers' bureau. He has for many years been deeply interested in the affairs of the Trenton Chamber of Commerce. His term of office is for three years.

John S. Broughton, president of the United & Globe Rubber Co., has offered three prizes of \$5 each for the highest averages in the work in the mechanical drawing classes at the Trenton School of Industrial Art.

General C. Edward Murray, of the Empire Rubber & Tire Corp., and W. J. B. Stokes, of the Thermoid Rubber Co., have been appointed members of the committee to raise \$35,000 for the Trenton Welfare Association.

The Whitehead Bros. Rubber Co., Trenton, has elected Samuel Cadwallader secretary and manager, succeeding the late Alfred Whitehead. Charles W. Appleget has been appointed sales manager for the same company.

MISCELLANEOUS NEW JERSEY NOTES.

James Deshler Wilmot, for the past three years superintendent of the United States Rubber Co.'s plant at New Brunswick, has been promoted to the position of production manager of the Goodyear's India Rubber Glove Manufacturing Co., Naugatuck, Connecticut. Mr. Wilmot was succeeded in New Brunswick by Seymour Hadaway, of New Rochelle, New York, who has had charge of the service department of the company's plants at New Haven, Connecticut. Mr. Wilmot has several times been promoted by the company, and has planned and carried forward many improvements for the benefit of the workers. The various clubs and recreational facilities at the New Brunswick plant were all planned by him and he has looked out for the welfare of the employees at all times. He planned and equipped the hospital where injured employees are treated and also inaugurated the citizenship school for foreign workers, and the athletic teams.

The Michelin Tire Co., Milltown, New Jersey, is planning shortly to erect fifty new frame cottages at Milltown for the use of the company's workmen. The houses will contain five rooms and bath, and will be erected on land owned by the company. More houses will be erected later.

The Stanwood Rubber Co., Inc., Elizabeth, New Jersey, which has executive offices at 9 East 40th street, New York City, is to build a new power plant, 75 by 84 feet, on a solid concrete and steel mattress. The first floor of the company's main building, which is about 150 feet from the power house, will be used for mill and calender room, while the second floor will be devoted to tire building and finishing, and the third floor will be used as a tire repairing room. The company is utilizing the former plant of the Hardman Rubber Corp. at New Brunswick, which it purchased some time ago, for the manufacture of its tubes.

Smith & Serrell, manufacturers of machinery couplings, have removed from the West street building, New York City, to 44 Central avenue, Newark, New Jersey.

The Driver-Harris Co., Harrison, New Jersey, has increased its capitalization to \$3,000,000, divided equally between common and preferred stock. The company is building a three-story addition to its plant, 52 by 100 feet, and is planning to add to this a 100-foot extension of equal height. The upper floor will be used as the general office, the second floor for spooling and

testing room, and the 2d and 3d for shipping and cleaning departments.

THE RUBBER TRADE IN MASSACHUSETTS.

By the Regular Correspondent.

DURING the recent traffic tie-up in New England, due to the series of blizzards which twice put the railroads more or less completely out of commission for several days, rubber plants were seriously affected. For a time snow shoveling was the principal business of many a rubber mill operative in an attempt to keep sidings clear. And when the Boston Chamber of Commerce sent out a call for men to assist the railroads to clear their lines, rubber men were among those who responded. Trucks were found inadequate for local deliveries, and several companies, including the Monaquitt Rubber Works Co., South Braintree, resorted to horses and puns.

On account of the embargoes on freight and express, the Boston Rubber Shoe Co. and the Converse Rubber Shoe Co. supplied their customers by parcel post shipments. It became almost a common sight to see the sidewalk in front of the Malden post-office blocked with several hundred cases of rubber footwear awaiting shipment. Several companies in the Boston district were perilously near a shut-down due to lack of coal, and the Panther Rubber Manufacturing Co., Stoughton, was actually closed for a few days. The Avon Sale Co., of Avon, timed itself over the period of fuel shortage by burning wood. The Revere Rubber Co., Chelsea, is installing an oil-burning system which it is believed has many advantages and will reduce the uncertainty of fuel supply to a minimum.

The eighteenth annual Boston Automobile Show under the auspices of the Boston Automobile Dealers' Association, Inc., was held from March 13 to 20 inclusive, and was in every respect the greatest ever held in this city. Mechanics Building proved inadequate and many of the exhibits were housed in the South Armory nearly in Irvington street for the benefit of the Y. D. Club. While it was essentially a show of motor vehicles, the exhibits of accessories were many and varied. Tires were never more in evidence, but for the most part displayed by local agents and distributors rather than the manufacturers. Giant cord tires for trucks were a conspicuous feature.

Among the exhibits of interest to the rubber trade were the following: Arrow Grip Manufacturing Co., non-skid devices; Iascon's Inc., Victor tires; Bigelow & Dowse Co., Franklin tubes; Budd Wheel Corp., Michelin steel disk wheel; Central Automobile Tire Co., tires and tubes; L. C. Chase & Co., top material; A. L. Cherry, Inc., Gordon tires and tubes; Cobb Electric Appliance Co., tube vulcanizers; Columbia Tire & Top Co.; Eastern Rubber Co., Magic Rubber Mend; Green & Sweet Co., Amazon and Miller tires; Grow Tree Co., Grow tires; Holland System, Inc., Trading Corporation, Overman tires; Lambert Trublruf Tire Co., Lambert Trublruf tires; New England Savold Tire Co., rebuilt tires; Northwestern Chemical Co., cements, tire and rim paints; Perrine Co., Braender tires and tubes; Record Tire Sales Co., rebuilt tires; E. P. Sanderson Co., Viking tires and tubes; Sewell Cushion Wheel Co., Sewell cushion wheel; Story Rubber Corporation, Bonner tubes; Times Square Auto Co., Buckskin, McLean, Timesco and Triumph tires and Timesco and Triumph tubes; Wetmore-Savage Co., Auburn tires; Austin J. Wright, Coldfield tire protector.

The Owen Tire Co., 177 Portland street, Boston, has secured the exclusive New England agency for the McClaren J. & D. tires manufactured by the McClaren Rubber Co., Charlotte, North Carolina, and is seeking local dealers throughout the territory.

Two days prior to the opening of the Boston automobile show the Michelin Tire Co. began holding its convention of New England salesmen at the Copley Square Hotel. At these daily conferences several officials from the home office were present, including J. A. Hines, assistant sales manager; J. J. Rooney,

credit manager, R. B. Bramwell, advertising manager, and W. L. Hogarty, Boston branch manager.

The Franklin Rubber Co., 134 Federal street, Boston, recently declared a regular annual dividend out of the earnings of 1919. At that time the corporation voted a dividend of like amount to be given to the employees April 1, based on their salaries for 1919. This new departure met with a gratifying response by the employees.

A new rest room for the girls in the Boston office of Everlastick, Inc., 52 Chauncy street, has recently been opened. It is attractively furnished and has electric stoves for warming food brought for luncheon.

At last automobile tires are among the articles being sold on the deferred payment plan. Farley & MacNeill, 107 Federal street, Boston, are offering Cleveland-Standard fabric and Tiger-Foot cord tires for a first payment down of 20 per cent of the list price and the balance in easy monthly installments covering a period of four to six months. These tires are made by the Standard Tire Co., Willoughby, Ohio, and carry guarantees of 6,000 and 10,000 miles, respectively.

The Greene & Daniels Co., Boston and Pawtucket, Rhode Island, which was incorporated under Massachusetts laws October 8, 1919, by articles of amendment filed December 1, 1919, changed its name to The Ninigret Mills. The authorized capital stock is \$1,050,000, and the company has mills at Pawtucket and Westerly, Rhode Island. H. T. Dunn is president and H. G. Fisk, Chicopee Falls, Massachusetts, is treasurer and clerk. The principal office is in Pawtucket, Rhode Island, the company having incorporated in that state under the name of The Ninigret Mills Co., November 20, 1918. The company manufactures all kinds of textiles and yarns, including tire fabrics. Further information about the development of this organization appeared in our issue of February 1, 1920.

James E. Odell, crude rubber broker, 200 Devonshire street, Boston, who has undergone a series of hospital operations during the past four months, is on his feet again, and after two months in the South hopes to resume his former activities. Meanwhile, the business is being ably conducted by his son, James E. Odell, Jr.

Coincidentally with the celebration of its eleventh anniversary, the Monaquot Rubber Works Co., of South Braintree, Massachusetts, announces the election of the following officers: James H. Stedman, president and treasurer; Merton A. Turner, vice-president and sales manager, and Benjamin Ayer, general factory manager.

Mr. Stedman is well known to the trade as the founder of this company and for his former prominence in the scrap rubber industry. He is still a young man despite many years of business activity.

Mr. Turner joined the company as a salesman at its inception and his success is evidenced by his election to the new office and the board of directors. He is one of the best known figures of the reclaimed rubber industry.

Mr. Ayer joined the organization in 1910 after his graduation from Dartmouth College, and advanced through the successive stages of foreman, production superintendent and factory superintendent to his present office. He is a keen student of labor and production conditions, and is the originator of methods which have signally increased the value of the company's recent successes.

The various teams of the Fisk Athletic Association of The Fisk Rubber Co., Chicopee Falls, Massachusetts, have always held high places in the rubber mill athletic activities of the country. And now comes the good word that the Red Tops on March 12 and 13 won the industrial championship of the United States in the American Industrial Athletic Association basketball tournament at Akron, Ohio.

To take care of the increased demand for "Big Nine" tennis shoes, which has exceeded the production facilities of the Malden factory, the Converse Rubber Shoe Co. has opened a stitching department at Concord.

L. J. Waldron, who has been selling Vacuum Cup tires in this territory for five years, has been appointed sales manager for New England by the Pennsylvania Rubber Co., with headquarters at 683 Beacon street, Boston.

The Akron Tire & Rubber Co., 24 Columbus avenue, Boston, is perfecting plans for opening a chain of branch stores in leading New England cities.

The Ajax Rubber Co., Inc., 158 Brookline avenue, Boston, has secured a fleet of Maxwell cars for the use of its several salesmen who call on New England trade. E. D. Winans, general manager, claims that a salesman's efficiency is increased from 25 to 60 per cent by the use of an automobile.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE MANUFACTURERS of rubber goods of all description in Rhode Island are still struggling to overcome the setbacks experienced since the beginning of the year through weather conditions. Ever since before Christmas the railroads and highways have been hampered by the worst accumulation of snow and ice that has been known in this vicinity since 1857. Train and trolley service was badly crippled, all freight traffic suspended and all movements of coal crippled. In consequence practically every plant in the state was idle for longer or shorter periods.

Business activities continue brisk and with good orders on their books all of the concerns are preparing for a considerable increase in volume that will exceed anything ever experienced. With the advent of settled weather, alterations, expansions and improvements are being generally rumored. Not only are the regular rubber plants active but also numerous textile plants that are manufacturing tire fabrics. A number of additional textile concerns are preparing to equip their plants, or a portion thereof, for tire fabric production which is expected to become a very substantial branch of both the rubber and the textile industries of the future.

The plant of the Ninigret Mills Co., Westerly, Rhode Island, owned by The Fisk Rubber Co., wherein is manufactured cord tire fabric, is running 23 hours daily and has been for several weeks past. The company has secured a new site and work is to commence on a new mill as soon as the weather becomes settled. The officers of the concern have already been transferred from the offices of the Westerly Textile Co., on Main street, to the new plant of the Ninigret Co., on Canal street, where convenient and attractive quarters have been established.

The additions to the plant of the Revere Rubber Co., Providence, that have been in process during the winter are now practically completed and are being occupied by the concern, greatly increasing its capacity and facilities. The new buildings cost upwards of \$200,000 and consist of two three-story concrete structures, one 150 by 50 feet, to be used as a chemical laboratory and the other, 120 by 100 feet, for manufacturing purposes. The latter also contains an employees' restaurant and recreation rooms such as have come to be regarded so favorably as essentials of contented economic community life. The combined floor space of both buildings amounts to 60,000 square feet and the latest types of machinery and laboratory apparatus are now being installed.

The new tire factory of the United States Rubber Co., in Providence, is to be called the "Colt Plant," in honor of Colonel Samuel P. Colt, chairman of the executive committee of that corporation. The factory is one of two units operated as the

Revere Rubber Co., and has heretofore been known as Revere Plant No. 2. It is planned that all of the truck tires, both solid and pneumatic, made by the United States Rubber Co., be manufactured at this plant, and to that end considerable new machinery and equipment are being installed.

During the recent freight embargo and bad condition of the roads the National India Rubber Co., Bristol, found the equipment of its batteries of boilers for oil burning especially efficacious. At present five boilers at the company's plant are "fired" by fuel oil and eleven by coal. But the company has arranged so that the latter will be equipped for oil burning in the near future.

The management of the National Co. continues to give much attention to the consideration of the welfare and social interests of the employees and already plans are under way for numerous athletic and out-door activities for recreation during the coming season. Recently a band was organized among the employees and this has been furnished with proper instruments and a competent band director engaged. William Ferrara has been elected bandmaster.

Work has been started on a one-story brick addition, 20 by 64 feet, at the plant of the American Wringer Co., on Social street, Woonsocket. It will cost about \$5,000.

The Weybosset Vulcanizing Shop, 362 Weybosset street, Providence, is being conducted by Wilfred Ginsell, according to his statement filed at the city clerk's office.

Work is nearly completed on a two-story brick addition, 38 by 30 feet, to an office building on Fairmount street, Woonsocket, for the Woonsocket Rubber Co., to cost about \$10,000.

The management of the Davol Rubber Co. announced that with the beginning of March a pay advance in the form of a bonus of 10 per cent for all employees who by promptness and attendance show interest in their work. This is to be paid at the end of each week, and represents the third general increase that has been made by this company during the past eight months.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

AKRON NOTES.

THE B. F. GOODRICH Co., Akron, maintains a body of trained men to guide visitors, and particularly those interested in the sale and manufacture of tires and rubber goods, through

GOODRICH FACTORY GUIDES.

its factories, and to explain to them methods and processes in rubber manufacture. This service, which was suspended in part during the war, is in full force again.

The factories have been inspected by visitors and associations from all parts of the world, among them the Foreign Trade Commission, which made a tour of the United States.

The Goodrich post of the American Legion has been officially named L. H. Kneil Post No. 255, in memory of Corporal L. H. Kneil, 55 Company, Fifth Marines, Second Division, who was wounded in action on the Meuse November 11, 1918, and died the following day. He was a member of department No. 16 of the Goodrich organization.

At intervals of one month during the fall and winter season rubber workers of The B. F. Goodrich Co., Akron, assemble in their recreation hall to witness lively boxing exhibitions by fellow employees. The accompanying picture was snapped at a recent "smoker," which was attended by nearly 2,000 people. A special clubhouse and training quarters are provided for the pugilistic students. Simms, the boxing instructor, has developed dozens of fast amateur fighters who had never before donned padded gloves.

GOODRICH BOXING CLUB'S HOME

Goodrich Recreation Hall is located in the heart of the plant and is equipped with up-to-date gymnasium apparatus, shower baths, lockers and the like. During noon hours an orchestra plays while employees dance. Moving-picture shows, lectures and social affairs are held at Recreation Hall.

BABCOX JOINS AKRON ADVERTISING AGENCY.

Edward S. Babcox, who was sales manager of the Rubber Products Co., Barberton, Ohio, has resigned that position to accept the vice-presidency and a directorship in The Akron Advertising Agency Co., Akron, Ohio.

For two terms Mr. Babcox served as vice-president of the Association of National Advertisers and he also was president of the Audit Bureau of Circulations.

Mr. Babcox's advertising experience dates back more than twelve years when he was a member of the advertising department of Yawman & Erbe, Rochester, New York, manufacturers of office supplies. From Yawman & Erbe he went to the Burroughs Adding Machine Co., Detroit, Michigan, as assistant advertising manager. A year or so later, Yawman & Erbe called him back to Rochester as advertising manager, and he remained there until 1913, when he took over the advertising management of the Firestone Tire & Rubber Co. He served in this capacity six years, after which he accepted the sales management of the Rubber Products Co.

EDWARD S. BABCOX.

C. P. Firestone has been elected temporary chairman of the Firestone American Legion Post, Akron.

The Star Rubber Co., Akron, has authorized an increase in capitalization from \$1,200,000 to \$4,000,000, of which \$1,500,000 will be eight per cent preferred and the balance common stock.

The Lambert Tire & Rubber Co., Akron, has elected the following officers: Henry M. Lambert, president; Judge Arthur Langguth, first vice-president and chairman of board of directors; J. W. Coyle, second vice-president; Porter E. Ramsey, director in charge of production, and John Hausam, secretary-treasurer and director in charge of Akron factory.

The H. B. Bixler Co. has been organized at Akron, Ohio, to supply engineering service to manufacturers in supervising processes and testing raw materials and finished products as well as in erecting plants and installing equipment. Plans are completed for erecting a two-story building, 80 by 300 feet, in which a complete modern rubber factory will be installed where all necessary machinery and new processes may be tested on a commercial scale. It will include a chemical and physical laboratory.

Makers of rubber-working machinery will be able to develop their machines and to demonstrate them under operating conditions. Manufacturers of rubber goods may use the plant while their own are under construction, and inventors may find the equipment to develop their ideas. A temporary laboratory, 47 by 80 feet, has already been put up and is handling work. H. B. Bixler is manager of the mechanical and electrical division, M. L. Allord of process and production work, and H. C. Roller of the technical laboratories.

The India Tire & Rubber Co., Akron and Mogadore, Ohio, expects to double its production of tires this year. It is adding more space to the present plant and will soon break ground for its new factory building, to be completed before the end of the year.

The Rubber Engineering Co., Akron, has removed from 325 Ohio Building to 46 South Broadway. On account of increased business, it was necessary for the company to secure larger quarters in order to improve its service to its customers.

A team to play the game of lacrosse will be formed among employees of The Goodyear Tire & Rubber Co., Akron, this year. This game is played with a hard rubber ball and specially constructed racquets.

The Amazon Rubber Co., Akron, has elected the following officers for the ensuing year: President, Dr. E. E. Quirk; vice-president, Frank B. Burch; treasurer, Walter Herberich; secretary and assistant treasurer, George Hupp. The directors include Messrs. Quirk, Burch, and Hupp, besides Gus Burkhardt, Albert Kroehe, W. A. Boesche, M. D. Kuhlke, and J. A. Berke.

Managers and salesmen of the Amazon company held a convention in Akron March 15-17, concluding with a banquet at the Akron City Club. The speakers included Edward S. Babcox, the newly elected vice-president of The Akron Advertising Agency Co.

The Avalon Rubber Manufacturing Co., Akron, has increased its capitalization from \$200,000 to \$1,500,000, and elected the following officers: J. Fred Hower, president and general manager; L. K. Hower, vice-president and factory manager; C. A. Carlton, secretary; and C. E. Siegfried, treasurer. These, with W. S. Salisbury, George Landis, and I. W. Mailach, constitute the board of directors.

The company expects to have its new tire plant at Sterling, Ohio, in operation by June 1. The Barberton plant will continue to handle mechanical goods and reclaiming.

The Columbia Tire & Rubber Co., Columbiana, Ohio, has elected the following officers: G. W. Henne, president; W. G. Henne, vice-president and general manager; Baird Broomhall, secretary;

W. F. Henne, treasurer; directors—W. B. Martin, F. M. Bushnell, L. C. Chase, E. O. Townsend, and J. C. Henne.

The company's plant at Mansfield, Ohio, is to be known as plant No. 1 and that at Columbiana as No. 2.

B. C. Wilson, formerly of the Martin V. Kelley Advertising Agency, Toledo, and the Miller Rubber Co. in Akron, has joined the Akron Advertising Co., Akron, Ohio.

C. A. Damen, of the sales force of L. H. Butcher Co., Inc., New York City and San Francisco, dealer in colors and chemicals for the rubber trade, has been assigned to the Akron office, succeeding George H. Jacobs, resigned.

MISCELLANEOUS OHIO NOTES.

J. W. Blaser has been elected treasurer and director of sales for The Rubber Products Co., Barberton, Ohio.

W. S. Delleit succeeds Edward S. Babcox, resigned, as sales manager of the same company.

The National Tire & Rubber Co., East Palestine, Ohio, has reorganized its financial plan and will issue preferred stock to the amount of \$1,000,000 in addition to 75,000 shares of no-par common stock. The present capitalization is \$1,000,000. The officers are: C. I. Merwin, president; S. L. Warner, vice-president and general manager; R. B. Taggart, treasurer, and C. W. Helman, secretary.

The W. F. Gammeter Co., Cadiz, Ohio, is planning to build a new factory, 80 by 240 feet, to take care of its increasing business, and a foundry for making semi-steel castings, in order to insure always having a supply of shell heads.

The Dayton Rubber Manufacturing Co., Dayton, Ohio, has increased its capital to \$10,000,000 of 7 per cent cumulative preferred stock, par \$100 per share, and 100,000 shares of common stock without par value. The additional working capital obtained from the underwriting of this stock, of which a considerable amount has already been secured, will be used in building a large addition to the present plant and for the installation of additional equipment. The new building will have approximately 100,000 square feet of floor space and will be all on one floor with a ceiling 30 feet high containing extensive skylights. This addition will be completed and machinery installed by July next.

The company will specialize in both cord and fabric pneumatic tires during 1920, in addition to its "Dayton Airless."

The officers and directors of the company are: John A. MacMillan, president; C. E. Heiser, vice-president; C. E. Hooven, secretary and treasurer; William R. Craven, Walter L. Kuhns, and A. O. Eberhart, directors.

F. N. Hammond has been appointed special representative of the sales department of The Portage Rubber Co., Barberton, Ohio.

The J. W. P. Tire Co., 952 Valley street, Dayton, Ohio, incorporated in July, 1919, built and sold its first tire in the latter part of the following September and has now ordered additional equipment for delivery within 60 days with which it hopes to be turning out 200 tires daily within six months.

The Reynolds Machine Co., Massillon, Ohio, will add a tire mold plant to its present equipment. No foundry will be erected before next year, but additional floor space will be provided for boring mills and other machinery, which have already been purchased to the extent of more than \$50,000. One mill has already been installed and several more are expected for delivery May 15.

The officers of the company are: F. C. Snyder, president; E. H. Birney, vice-president, and O. F. Binford, secretary-treasurer. The company has increased its capital stock from \$200,000 to \$500,000 to provide for the above expansion.

The Knox Tire & Rubber Co., Mt. Vernon, Ohio, has begun work on its new factory, ground having been broken on January 3, with appropriate ceremonies. B. E. Frantz is president.

The Allsteel Ridewell Tire & Rubber Co., 513 Lindsey Building, Dayton, Ohio, has purchased a factory site of 34 acres on the Baltimore & Ohio railroad and the Miami river, and is having plans and specifications prepared for a three-story and basement factory with three wings. This will be built of structural steel with brick facing and have 125,000 square feet of floor space. The company will manufacture a patented cord tire to be called the "Artyr," besides inner tubes and battery jars.

The president of the concern is A. Huetter who, in the summer of 1918, was elected vice-president and general manager of the Premier Rubber & Insulation Co., Dayton, previous to which he was for two years the head of the Bakelite department of the Dayton Engineering Laboratories Co.

Innis, Spelden & Co., Inc., New York City, announce the removal of its branch in Cleveland, Ohio, from 641 Long avenue to 1913 Orange avenue on April 1, where a full line of chemicals for the rubber trade will be carried.

THE ERIE TIRE & RUBBER CO.

An enviable record of accomplishments is that made by The Erie Tire & Rubber Co., Sandusky, Ohio. This company was organized at Cleveland, Ohio, in March, 1919. Within six months their securities were fully sold, and the following November the factory began the manufacture of cord tires and inner tubes.

The officers of the company are: Peter F. Wills, president and general manager; H. H. Forrest, vice-president and general superintendent; F. W. Hildebrand, secretary, and H. M. Learned, sales manager.

The company's plant at Sandusky is being enlarged by the addition of new buildings now under construction, which will increase the capacity of the plant to 1,500 cord tires a day. The

A. HUETTER.

C. E. COOK.

DIRECTOR OF GOODRICH MECHANICAL SALES.

CLARENCE EDWARDS COOK, director general of mechanical sales for The B. F. Goodrich Co., Akron, Ohio, is well fitted for this important position by long and varied experience with the Goodrich organization. Mr. Cook was born in Cleveland, Ohio, and received his education in the grammar and high schools of that city, graduating in 1895. That year he entered the freight office of the Lake Shore & Michigan Southern Railway as a clerk, where he remained four years. Attracted by the rubber industry, he was in the employ of The B. F. Goodrich Co. for two years, but returned to the railroad in 1901 for another year. In 1902 he went to the People's Hard Rubber Co., and the following year took a position as traveling salesman in Ohio, Indiana and Kentucky for the Gutta Percha & Rubber Manufacturing Co., New York City. In 1905 he accepted a traveling position with The B. F. Goodrich Co., and five years later found him Pacific Coast manager. From this position in 1917 he was promoted to the post of director of branch operations in charge of 120 branches and stores selling Goodrich products throughout the country. On June 1, 1919, he was again advanced to director of mechanical sales, which position he now holds.

Mr. Cook has an extensive acquaintance in the rubber trade and elsewhere. He is a thirty-second degree Mason and Shriner.

MID-WESTERN NOTES.

By Our Regular Correspondent.

THE KOKOMO RUBBER CO., Kokomo, Indiana, is one of the oldest industrial organizations of its kind. It made the first pneumatic automobile tires in the United States, and since the days of the high-wheeled bicycle it has supplied the bicycle trade with tires. The original pneumatic automobile tires are still part of the equipment of the Elwood Haynes' first American automobile, a famous industrial landmark on exhibit at the Smithsonian Institute, Washington, D. C.

J. W. Culver has been appointed manager of the central district offices and warehouse of The Federal Rubber Co. of Illinois, Cudahy, Wisconsin, with headquarters at 1434 Michigan avenue, Chicago, Illinois. He was formerly manager of the company's mechanical rubber goods department.

E. T. Fisher has been appointed manager of the Denver, Colorado, branch of The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio.

C. A. Jessup, formerly manager of the St. Louis, Missouri, branch of the Kelly-Springfield Tire Co., New York City, has been appointed manager of the company's branch at 294 Jefferson avenue, Detroit, Michigan.

A new building for the Detroit branch is being erected at the corner of Cass avenue and Antoinette street.

The Yarnall-Waring Co., Philadelphia, Pennsylvania, manufacturer of "Yarway" power plant devices, has opened a branch office in the Builders and Traders' Exchange, Penobscot Building, Detroit, Michigan, in charge of Walter G. Heacock, branch manager.

The Portage Rubber Co., Barberton, Ohio, has opened a branch at 450 Jackson street, Milwaukee, Wisconsin, to take care of increasing business in that territory. P. S. Manley has been appointed branch manager and six salesmen will work from this center.

The Mason Tire & Rubber Co. of New York, Inc., 450 Jackson street, Milwaukee, Wisconsin, has been granted a Wisconsin

PLANT OF THE ERIE TIRE & RUBBER CO.

manufacturing policy of the company is to concentrate output exclusively on cord tires and tubes.

Appreciating that the realization of the plan to produce a strictly first-class product depends, in large degree, on able and efficient workmen, every effort is being made by the management to enhance that efficiency in ways that will contribute to the contentment of the operating force. The welfare activities are planned on the latest ideas and include a medical department under the direction of a physician, recreation grounds and a cafeteria. Special attention has been given to housing conditions, and several modern homes have been erected near the factory.

THROUGH AUGUST, 1919, TRINIDAD AND TOBAGO HAD SHIPPED 24,673 pounds of rubber, as compared with 18,809 pounds for the same period in 1918, 12,102 pounds in 1917 and 5,063 pounds in 1916.

licence to do business as a foreign corporation. This is a branch of the selling organization of The Mason Tire & Rubber Co., Kent, Ohio.

Packard Tire Stores, Inc., 436 Milwaukee street, Milwaukee, Wisconsin, has increased its capital stock from \$50,000 to \$100,000. It distributes McClaren tires, J. & D. brand, in Iowa, Wisconsin, and the upper peninsula of Michigan. It has one branch in Des Moines, Iowa. H. A. Packard is president.

The Tomah Rubber Corp., 176-182 Sixteenth street, Milwaukee, Wisconsin, has been organized as a preliminary company to develop a number of patents in tires and tubes, including a patent valve and a puncture-proof inner tire. The officers are: Leo Hofmeister, president and treasurer; Ray W. Slater, secretary; John R. Matthews, vice-president.

If this development work proves satisfactory, a new company called Allenton Rubber Mills will be organized and a three-story factory office, 96 by 96 feet, will be built at Allenton, Wisconsin, as soon as weather conditions permit. A site has already been purchased.

The Tomah Rubber Corp. is associated with the North Star Oil & Rubber Corp., 176 Sixteenth street, Milwaukee, Wisconsin, as are also the Sheboygan Oil & Rubber Corp., Sheboygan, Wisconsin, the Fond du Lac Oil & Rubber Corp., Fond du Lac, Wisconsin, and the Multi-Products Co., Milwaukee, Wisconsin.

The Otto Tire & Rubber Co., 208-210 Upper Fifth street, Evansville, Indiana, incorporated in December, 1919, has purchased several pieces of property on Sycamore street in order to remodel its vulcanizing department and enlarge its Gates half-sole and Maxotire department. It expects to be in full operation by May 1, confining its business to tires and accessories. H. J. Otto is president and general manager, G. H. Bippus treasurer and A. J. Hoffman secretary.

The Kansas City Tire & Rubber Corp., formerly of Kansas City, Missouri, was placed in the hands of receivers on May 24, 1919, on application of certain stockholders for the protection of their interests. In July, P. E. Werner, who organized the company, was appointed manager by the receivers to straighten out the affairs of the concern. About the middle of October the court granted permission to operate the factory at Kansas City, Kansas, manufacturing fabric tires. In December certain creditor banks applied for the sale of the property, but were refused by the judge at a hearing held on December 29. It is probable that operation will be continued by the receivers until a satisfactory reorganization can be accomplished. Meanwhile the factory at Kansas City, Kansas, is being operated day and night with two shifts of workmen, each shift working 8½ hours. Mail should be addressed to the general office at Fourth and Central streets, Kansas City, Kansas. The company owns a second factory at Chester, West Virginia, which has been rented.

The Two-in-One Tire Co., 418-420 Bridge street, N. W., Grand Rapids, Michigan, which operated its reliner business under the name of the National Tire & Reliner Co., has increased its capitalization to \$675,000 and changed its name to First National Tire & Reliner Co. The officers are: R. Roden, president; I. Warsaw, secretary; A. J. Gorney, treasurer and general manager.

The Council Rubber & Tire Co., Broadway and Main street, Council Bluffs, Iowa, incorporated last December, will build a factory for the manufacture of mechanical rubber goods, pneumatic and solid tires and inner tubes, and the reclaiming of rubber goods. W. R. Blowers, president of the company, has been in the rubber business over 30 years. The other officers include F. A. Nabbs, vice-president; William E. Hyland, secretary, and Elmer E. Weberg, treasurer. The authorized capital of the concern is \$1,500,000.

The Madison Tire & Rubber Co., Inc., New York City and Buffalo, New York, has opened a branch for the sale of its tires and tubes at 1606 South Michigan avenue, Chicago, Illinois, in charge of John H. Jones, Jr., and John M. Erickson.

The Burlock Rubber Clothing Co., 297 Third street, Milwaukee, Wisconsin, recently incorporated at \$250,000, for the purpose of rubberizing and manufacturing leatherette and suede coats as well as a general line of raincoats, is building a rubberizing plant at Wausau, Wisconsin, which will later be the company's headquarters.

The Quality Tire & Rubber Co., Anderson, Indiana, and the Long-Wear Rubber Co., Elyria, Ohio, which has changed its name to The Long-Wear Tire & Rubber Co., have arranged to consolidate under the last name. The capital of the Quality company was \$750,000 and of the Long-Wear company, \$500,000. The new concern is capitalized at \$5,000,000, divided into \$700,000 preferred and balance in common stock. General offices will be maintained at Anderson, Indiana. Frank W. O'Brien is general manager. The Elyria plant will be enlarged later by an addition for the building of cord tires.

The International India Rubber Corp., South Bend, Indiana, has increased its capital stock from \$1,000,000 to \$2,500,000 to take care of its increased business. The present plant is operating both day and night in the effort to increase production until the new plant additions under construction can be put into operation.

The company has promoted its Pacific Coast representative, C. H. Mayer, to the position of assistant sales manager at the South Bend office.

The Standard Four Tire Co., Keokuk, Iowa, maintains a branch at 245 North Penn street, Indianapolis, Indiana.

The Jostam Manufacturing Co., 1036 Montana street, Chicago, Illinois, has made a special arrangement with The B. F. Goodrich Rubber Co., Akron, Ohio, whereby it becomes the distributor of the Goodrich recoil pads known as "Akron," "Norka," and "H. R. B." The first two are slip-on pads and the last is the silver pattern pad.

The Brunswick-Balke-Collender Co., Chicago, Illinois, has contracted for additional equipment and improved processes to be used in its new factory at Muskegon, Michigan, which adds at least \$250,000 to the estimated \$1,500,000. Housing accommodations for employees are being made as well.

The Pan-American Rubber Co., Watertown, Wisconsin, has elected the following officers and directors: Max G. Kusel, president; Charles Christman, vice-president; O. C. Wertheimer, secretary and treasurer; directors—the above together with A. F. Mayer and Frederick Saxmann.

The Dryden Rubber Co., 1014 South Kildare avenue, Chicago, Illinois, is building a new power plant and a new factory building 180 by 70 feet, two stories, for the exclusive manufacture of inner tubes. Both are of brick, concrete, and steel construction. The company reports sales greatly increased over the corresponding period of last year.

The Latex Tire & Rubber Co., Fond du Lac, Wisconsin, organized last May, has already put up the first unit of its factory, a two-story building, 50 feet by 150, with a capacity of 300 tires and 700 tubes a day, on the shores of Lake Winnebago, with good railroad connections. The company expects to be manufacturing tires and tubes within a few weeks. It will specialize in the Latex Non-Skid and Ribbed Tread tires and the Lambricht cushion tire.

The officers of the company are: F. S. Dannenberg, president and general manager; J. T. Brofka, vice-president; J. T. Jones, secretary and sales manager; Orlando J. Koll, treasurer. Grant Lambricht, for many years with The B. F. Goodrich Co., is general superintendent, and D. J. T. Kennedy is assistant superintendent in charge of publicity.

Rub-Tex Products, Inc., 454 Lemcke Annex, Indianapolis, Indiana, has recently been incorporated to make mechanical rubber goods from used and discarded automobile tires; also

rubber heels and fiber soles. Edwin H. Emrick is president and Scott C. Legge treasurer.

WESTERN MANAGER, GLOBE RUBBER TIRE MANUFACTURING CO.

R. B. TRACY.

Another seasoned executive was added to the staff of the Globe Rubber Tire Manufacturing Co., when R. B. Tracy recently assumed the duties of western manager, following more than fifteen years' association with the Michelin Tire Co.

Mr. Tracy's connection with the tire industry dates back about twenty years when he became connected with the Pope Manufacturing Co., Hartford, Connecticut. Upon joining the Michelin forces he started as manager of the Cleveland, Ohio, branch. Four years later he was promoted to management of the Chicago branch, which included supervision over the Minneapolis, St.

Louis, Des Moines, Cleveland and Kansas City branches. In 1915 he was appointed factory representative, with all branches west of Philadelphia under his direction.

Mr. Tracy has an extensive acquaintance and many friends throughout the Middle West that should prove valuable assets in promoting the sale of Globe tires in that territory.

MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.

THE MARCH MEETING of the Mid-West Rubber Manufacturers' Association was held in Chicago, Illinois, March 9, at the Chicago Athletic Association, and was the most largely attended of any of these monthly meetings. Fifty-one members were present and the opinion was voiced by all that the gatherings of the Association were of increasing interest and most beneficial.

John T. Christie, president of the Association, called on a number of the members to express themselves regarding trade conditions for the benefit of those present.

An incident of the meeting that awakened enthusiasm was the presentation of a handsome silver loving cup to John W. Maguire, vice-president and general manager of The Portage Rubber Co., Barberton, Ohio, and the first president of the Mid-West Association, in recognition of his services in organizing and guiding the Association through its first year.

It had been intended to present the cup at the February meeting, but Mr. Maguire had been unable to be present.

The presentation speech was made by Fred J. Horn, Akron representative of Fred Stern & Co., New York City, who spoke of the great need of a center for rubber activities in the mid-western states and the satisfactory manner in which Mr. Maguire had succeeded in anticipating that necessity.

PRESENTED TO JOHN W. MAGUIRE BY MEMBERS OF THE MID-WEST RUBBER MANUFACTURERS' ASSOCIATION, FEBRUARY 11, 1920.

Mr. Maguire responded to what had come as a total surprise to him, with words of thanks to the donors. He told of how a few of the manufacturers had organized in January, 1919, the association which now gave promise of a successful career, at the same time disclaiming any special credit for himself. His efforts, assisted by those associated with him, were to meet a situation that confronted them. Nevertheless, he was more than grateful to his friends who had thought his efforts worthy of this handsome testimonial.

During the meeting it was decided to create the office of second vice-president and the dual office of general manager and secretary. W. W. Wuchter, president of the Nebraska Tire & Rubber Co., who had been serving as secretary, was elected second vice-president, and H. S. Vorhis general manager and secretary.

The following new members were elected:

REGULAR MEMBERS.

Black Hawk Tire & Rubber Co., Des Moines, Iowa.
Century Rubber Works, Chicago, Illinois.
Johnstone Tire & Rubber Co., La Porte, Indiana.
The Overland Tire & Rubber Co., Omaha, Nebraska.
Surety Tire & Rubber Co., St. Louis, Missouri.

ASSOCIATED MEMBERS.

Duffy & Sears, New York City.
W. E. Byles, New York City.
Gove & French, New York City.
Bennett Day & Co., New York City.
The Rex-Hide Manufacturing Co., East Brady, Pennsylvania.

THE RUBBER TRADE ON THE PACIFIC COAST.

A PIONEER CALIFORNIA RUBBER FACTORY.

THE PIONEER RUBBER MILLS, the name assumed by the Bowers Rubber Works, is greatly increasing its plant at Pittsburg in Contra Costa County, California. First started by W. F. Bowers forty years ago as the Pacific Coast branch of the Gutta

THE PIONEER RUBBER MILLS, PITTSBURG, CALIFORNIA.

Percha & Rubber Manufacturing Co., as W. F. Bowers & Co., then as the Bowers Rubber Co. and the Bowers Rubber Works, it has taken a leading part in developing the rubber industry of the Pacific coast. It was the first company to import crude rubber directly into California and still keeps up the practice by drawing the raw material from the rubber plantations of the East Indies straight to its wharves at Pittsburg.

The plant covers about twenty acres of ground and a good sized town near it houses its large working forces. The company devotes its attention to mechanical rubber goods such as "Skookum" piston rod packing, "Copper Queen" rubber transmission belting, "Sunset" elevator and conveyor belting, "Owl" pneumatic hose and "Victor" fire hose.

All compounding, mixing, and working up of the crude rubber are done at the Pittsburg plant. There the company is now building for the reclaiming plant a two-story reinforced concrete building, covering 50 feet by 115. It plans to increase and expand its mechanical rubber capacity to more than double its present capacity, being driven to this by the fact that for three

years past the plant has been operating to full capacity, twenty-four hours a day, in the effort to meet the growing demand, domestic and foreign, for the company's wares.

The fabric used by the Pioneer Rubber Mills is made from California long-staple cotton, grown in the Imperial valley and ginned and spun in California. Almost all of the cotton duck used is woven on the company's own looms.

LOS ANGELES NOTES.

W. A. Messick, Los Angeles, has applied for a patent on a pneumatic rubber cushion for the top of crutches; also for one on a similar cushion for butt ends of rifles and shotguns.¹

Harry H. Anderson, Los Angeles, who, though still in his early twenties, has attained prominence in the tire industry, has been made sales manager for Hess & Hackett, distributors of Oldfield tires.

Frank R. Carroll, former Los Angeles branch manager and later district manager of The B. F. Goodrich Rubber Co., has been appointed vice-chairman of the board of directors of the Yokohama Rubber Co., Limited, the Japanese subsidiary of the Goodrich company.

In the financing of the new Coast Tire & Rubber Companies Securities, a \$1,000,000 California corporation, an inducement is offered prospective stockholders of 15 per cent discount on tires and tubes, besides 8 per cent dividend on their investment. C. L. Stackhouse, 327 Douglas Building, Los Angeles, is district manager.

Charles W. Seiberling, brother of Frank A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, Ohio, was recently in Los Angeles with the company's mechanical engineer, W. C. State, and will plan to establish at the company's plant now being built in Los Angeles a recreation department that may even surpass that strong feature of the parent works in Ohio.

The Huntington Rubber Co., Los Angeles, has installed equipment for salvaging not only solid tires for trucks, but also giant pneumatics up to ten inches, such as are used on the heavy passenger stages and the freight motor cars on various routes between Seattle and San Diego. Up to recently the tire wastage on stage lines meant a serious loss, but as means have been found to restore old tires to almost maximum efficiency at about a third the cost of new ones, the transportation companies through this saving are now in a better position to offset the general rise in the cost of labor and materials.

Giant pneumatic tires are gradually supplanting heavy solid tires on motor stages that run between San Diego and San Francisco, California. The fine roads and the temperate climate are, of course, favoring factors for big pneumatics. Fully 500 cars, carrying on an average 10,000 people, leave the Union Stage Terminal in Los Angeles daily, and the extension of the stage transportation service as far north as the Canadian border is contemplated.

John F. Scanlon, advertising manager of the United States Compression Inner Tube Co., Tulsa, Oklahoma, was given a dinner recently by his Los Angeles newspaper friends at the Hotel Alexandria.

Sufficient headway has been made in the construction of the Goodyear Tire & Rubber Co. plant in Los Angeles, to warrant the projectors in saying that the factory, which will employ 10,000 workers at full capacity, will start manufacturing by June 1.

A new building is about to be erected by the J. B. Wood Tire & Rubber Co., at Third street and Central avenue, Los Angeles, as a distributing station for Hewitt tires, tubes, and mechanical

¹The use of rubber in road rails is by no means new. Those on the market are, as a rule, solid rollers or contain sponge rubber for extra resiliency. Nor is the pneumatic pad a novelty. In THE INDIA RUBBER WORLD for March 1st, 1918, page 163, is a description and illustration of "White Pneumatic Road Pad," which was manufactured by J. R. Winters, Clinton, Missouri.

rubber goods, the sale of which the Wood concern controls in Southern California, Arizona, and Western Texas.

The Los Angeles Horseshoe Tire Co., of which Charles Daley is manager, and which was recently appointed by the Pacific Rubber Co. as general Los Angeles distributor of Horseshoe tires and tubes, has been obliged, through increase in business, to move into larger quarters at 1037 South Figueroa street.

Dr. P. J. S. Cramer, of Amsterdam, Holland, the eminent authority on rubber botany, has been touring in the United States. He gave two lectures recently in Los Angeles and it is likely he will speak at several American universities before returning to Europe.

The Pacific Coast branch of the Standard Four Tire Co., Keokuk, Iowa, is at 342 West Pico street, Los Angeles.

SAN FRANCISCO NOTES.

The Michelin Tire Co. of California, 1644 Pine street, San Francisco, has completed plans and specifications for its new warehouse on 12th street between Mission and Howard. The new building will be 120 by 100 feet, and have a private spur track, which is now under construction. In addition to providing storage space for the new Michelin disk wheel, which is just being placed on the market, there will be included in the structure a conference room and separate lunch rooms for men and women employees. The San Francisco organization is a subsidiary of the Michelin Tire Co., Milltown, New Jersey.

Weinstock-Nichols Co., San Francisco, one of the largest distributors of motor car accessories in California, has been appointed by the Hewitt Rubber Co. as distributors for Hewitt tires in the northern section of the state. This concern, which has branches in the leading cities of California, will distribute Hewitt tires exclusively.

CANADIAN DUNLOP COMPANY BUILDING NEW TIRE PLANT.

The Dunlop Tire & Rubber Goods Co., Limited, of Canada, with headquarters in Toronto and branches in fourteen other

NEW TIRE PLANT OF CANADIAN DUNLOP IN TORONTO.

cities and towns in Canada, is building and equipping a new factory in Toronto for which \$1,500,000 has been appropriated. The building, here represented, is being rushed to completion; it is 400 feet long, 80 feet wide, with four stories and basement. It will be devoted especially to the manufacture of Dunlop cord tires.

The expansion is part of the aggressive campaign started by the Dunlop Rubber Co., Limited, of England, which besides its close connection with the Dunlop companies in France, Italy, Japan and Australia has recently started Dunlop America Limited in the United States. The Canadian company, which shares in the formulas, processes, methods and investigations of the British and other Dunlop companies, announces that it will co-operate with and will be closely connected with the United States company.

Activities of The Rubber Association of America.

ASSOCIATION MEETINGS.

THE REGULAR MONTHLY MEETINGS of the Executive Committee, Mechanical Rubber Goods Manufacturers' Division, and the Executive Committee of the Tire Manufacturers' Division were omitted in March. The Executive Industrial Relations Committee met on March 12 and 13 and gave its attention to matters of general interest to rubber manufacturers. A report of the Committee's activities at this session was distributed to members of the Association through the medium of several communications dealing with the specific subjects.

REDUCTION IN CARLOAD FREIGHT RATES ON TIRES IN SOUTH.

In a recent decision of the Interstate Commerce Commission upon complaint as to the ratings applying on tires and tubes from points north of the Ohio and Potomac Rivers and west of the Mississippi River to southern points, the Commission directed that ratings be established to become effective on June 2, 1920, which shall provide third class rates, minimum carload weight of twenty thousand pounds on pneumatic tires in straight carloads, and third class minimum carload weight thirty thousand pounds on solid tires in straight carloads, mounted or unmounted, and on mixed carload shipments of pneumatic and solid tires and tubes third class rates, minimum carload weight thirty thousand pounds.

Heretofore, carload rates have not been in effect on shipments of tires and tubes to southern points and this reduction in the rates will result in a great saving in transportation charges on carload shipments to southern territory.

HEARINGS BEFORE THE INTERSTATE COMMERCE COMMISSION WITH RESPECT TO THE TRANSPORTATION ACT OF 1920.

The Interstate Commerce Commission held hearings in Washington on March 22 to 24, inclusive, at which proposals of the carriers, railroad security owners and the shipping public were received with a view to assisting the Commission in deciding the matter in which that feature of the Transportation Act of 1920 relating to the grouping of the carriers for rate-making purposes and the basis upon which the 5½ per cent guaranty return on the aggregate value of the railway properties shall be determined.

In view of the importance of this question, the settlement of which will determine the increase in transportation charges that will be necessary to furnish the carriers with sufficient revenue to conduct their business properly for the two years following September 1, 1920, the Traffic Department of The Rubber Association was represented at these hearings for the purpose of keeping in close touch with the situation.

Based upon the representations made to the Commission, it is felt that that body will decide that for present purposes the investment account of the carriers will be used for the basis for figuring the 5½ per cent return, and that the three existing freight classification territories will be used for grouping the carriers for rate-making purposes. The investment account will probably be subject to such corrections as the Commission may consider necessary.

UN SOUND NATIONAL ORGANIZATION SCHEMES.

NEW YORK, March 16, 1920.

To firm and affiliated members:

In discussing the work of the Industrial Relations Committee, it is found that practically every member of the committee has had numerous representatives of national organizations solicit their companies for financial support, and endorsement of various schemes. Many such propositions, although their objects may be laudable, do not have the organization or practical executives to carry on the work successfully. Many others do

not have the merit of being sound, although a superficial examination might lead one to believe that they are worthy of support.

The committee believes that they can render a service to the members of the Rubber Association by investigating such organizations, and giving the members the benefit of their views on such matters. Therefore, if at any time, member companies desire to secure information in regard to any such organizations, if they will communicate with the general manager of the Rubber Association he will refer it to the Industrial Relations Committee for a report, and the committee will give their views on the matter.

Along this line, at the present time, a man named Albert St. Peter, from Pittsburgh, is endeavoring to build up a national organization for carrying on Americanization work. The committee has investigated this organization, and emphatically disapproves of the plan. The name of this organization is the National Institute for Americanization and Education. The committee believes that an organization such as this cannot carry on this work efficiently and they further believe that Mr. St. Peter himself has not demonstrated that he has executive ability to put through any such comprehensive plan, judging by his record in similar propositions with which he has been identified recently.

A. L. VILES, General Manager.

INDUSTRIAL RELATIONS.

NEW YORK, March 19, 1920.

To firm and affiliated members:

The Industrial Relations Committee wishes to call the attention of members to the bill recently enacted by the Kansas Legislature, for the establishment of Industrial Courts. A similar bill is now pending in the Legislature of the State of New Jersey, the number being Senate Bill 281.

The Kansas Industrial Relations Court law would seem to be, in the opinion of your committee, a justifiable experiment. Its successful working out can only be determined when proven by the test of time.

Your committee also wishes to impress on every member the importance of becoming thoroughly familiar with the report of the President's Second National Industrial Conference, which is now in the hands of the printer, and will be published within a few days. The Rubber Association will try to furnish each firm member with a copy of this report, as soon as it can be obtained from the printer; also copies of the Kansas and New Jersey bills.

The President's Industrial Conference, in all probability, will recommend the establishment of regional courts, and a national tribunal for the handling of all industrial disputes.

Your committee believes that there are some phases of this plan which should be given very serious consideration, since this is such a radical departure from present methods. Although some tribunals and courts may seem to offer a solution, theoretically, it would seem that there might be a possibility of such machinery creating more industrial disputes than we now have. Labor organizations would have everything to gain and nothing to lose, by getting a dispute before such a court, and once the machinery is established, there would be a great temptation on the part of certain people to use it. Further experiences show that the type of individual selected to serve in such positions is not the type who understands business or industrial problems, and in most cases people are selected because of their political affiliations rather than their practical knowledge of matters which come before them.

Your committee will discuss at its next meeting the report as a whole, and will furnish to member companies an expression of its opinion.

A. L. VILES, General Manager.

INDUSTRIAL RELATIONS—EMPLOYMENT.

NEW YORK, March 16, 1920.

To firm and affiliated members:

Replies to the letter of your committee on industrial relations, dated February 18, 1920, have been very gratifying. More than a hundred and twenty-five manufacturing members, large and small, have designated an executive or a specialist within their organization to supervise the work of industrial relations, and additional replies are being received daily.

It is the aim of your industrial relations committee to serve you intelligently whether your plant is large or small. In order to make the rubber industry foremost in industrial relations it is necessary that the members adopt a sound general policy which will fit local conditions.

As is well known, many of the larger plants in the rubber industry have industrial relations departments well established. While it is hoped that all plants can profit from the service offered, the committee, in outlining labor policies which have proved successful, has decided to begin at the beginning and proceed along practical lines as though each plant were just starting the study of industrial relations.

Assuming that a manufacturer has appointed an executive or specialist to supervise industrial relations work, experience indicates the next step to be the problem of employment.

Experience has shown that in any plant employing one hundred or more persons some one should be appointed on part time for smaller plants or full time for larger plants to specialize on the employment problem. He should report to the executive or specialist responsible for industrial relations. His duties should consist of supervision of employment, keeping records, hearing of all grievances, investigation of all discharges, care of all transferring and the study of causes of and remedies for labor turnover.

It is a mistake to place a mere clerk in such a position. A high-grade man with a naturally pleasant personality, good judgment, and plenty of back-bone should be appointed. Hiring and discharging by individual foremen are eliminated when the employment manager is introduced, and therefore diplomacy, good judgment and back-bone are needed in the employment manager.

The employment division must have a thorough knowledge of the company's needs for help, of the sources of supply and of approved methods of selection and placement so that each employee's experience and ability will be best utilized; should give the new employee general information as to shop regulations and as to the company's industrial policies, and should see that the employee receives, through the proper channels, such instruction as is needed to enable him to become familiar with his duties. The division should thereafter maintain an interest in the progress of the employee.

A great deal more might be written on the subject of employment. Your committee feels, however, that it is advisable for each plant to build up its own employment policies in accordance with local conditions. Your committee can make available to you plans and policies of employment departments which have been operating for some time in plants of various sizes and would prefer to answer any inquiries that may arise rather than to be considered as advisors.

A. L. VILES, General Manager.

QUESTIONNAIRE OF REPUBLICAN NATIONAL COMMITTEE ON INDUSTRIAL RELATIONS AND THE PROBLEMS OF CAPITAL AND LABOR.

NEW YORK, March 19, 1920.

To firm and affiliated members:

The Republican National Committee, through its Advisory Committee on Policies and Platform (with headquarters at 19 West 44th street, New York), has distributed a questionnaire on industrial relations and the problems of capital and labor, of

which you have doubtless received a copy, as we understand it has been given wide distribution, particularly among manufacturers. If, however, you have not yet received a copy, we shall be very glad to arrange to have one forwarded immediately.

Because of the broad questions of policy and practice which are involved in the questionnaire and because the inquiry is of so searching a nature in the extent to which it goes into detail, it has been thought desirable to have the questionnaire given consideration by our members from the broader point of view of the entire industry, and to this end President Sawyer has requested the Executive Industrial Relations Committee to meet to give consideration to the specific questions presented therein with the view to developing information which, it is believed, will be helpful to members of the association in making their responses to the questionnaire. This committee is to meet next week, and it is expected that the information which may be developed by the Executive Industrial Relations Committee will be available to our members the latter part of the week.

It should be thoroughly understood that such suggestions or information as may emanate from the Executive Industrial Relations Committee, following its examination of the questionnaire, are only offered as possibly of help to our members in their study of it, but because the work of the committee may develop phases of the problems involved which are not apparent to individual members, it may be thought desirable by some of them to await advices from the Executive Industrial Relations Committee before disposing of the questionnaire.

If the suggestion presented in the foregoing is well thought of, we shall be very glad to have our members handle this matter accordingly, and further communications from the Executive Industrial Relations Committee will be transmitted to you as soon as possible.

A. L. VILES, General Manager.

SPRING MEETING OF RUBBER CHEMISTS.

The Rubber Division of the American Chemical Society will hold its meeting at St. Louis, Missouri, April 14 and 15, in conjunction with the spring meeting of the society. The following program of subjects that are of vital interest to the trade should insure a large attendance.

1. Discussion of report of committee on "Physical Testing."
2. "Bromine Addition to Rubber," W. K. Lewis and Wm. H. McAdams.
3. "Relative Value of Shoddy in Mechanical Rubber," J. M. Bierer.
4. "Recovery of Volatile Solvents," W. K. Lewis.
5. "The Determination of True Free and True Combined Sulphur in Vulcanized Rubber," W. J. Kelly.
6. "Analytical Determination of the Coefficient of Vulcanization," S. W. Epstein.
7. "Small Amounts of Magnesia and Certain Organic Substances as Accelerators," G. D. Kratz and A. H. Flower.
8. "Obscuring Power of Pigments," W. K. Lewis.
9. "The Effect of Compounding Ingredients on the Physical Properties of Rubber" (lantern), C. O. North.
10. Symposium on the testing of pigments. Led by W. W. Evans.

Attention is called to the symposium on "Colloid Chemistry" by the Physical and Inorganic Division. Arrangement will be made, if possible, so that both these papers and those of the Rubber Division will be given at such times as not to conflict with each other.

THE DUNLOP RUBBER CO. OF AUSTRALASIA, LIMITED, INCREASED its profits in 1918 to £145,500 by £30,000 over the year before, and in its report for 1919 the profits increased to £177,000, which enabled the directors, after paying 10 per cent on the preferred shares to distribute 13 per cent to the ordinary shares and to lay away £53,330 in its reserve funds.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

AT THE ANNUAL MEETING of the India Rubber Manufacturers' Association, J. T. Goudie, of the Leyland & Birmingham Rubber Co., Limited, vacated the chair after five years of strenuous occupancy, and Stuart A. Russell, of the Silvertown Rubber Co., Limited, was elected to the position; H. C. Coles, of Wm. Warne & Co., Limited, the vice-chairman, having declined the honor. Mr. Coles also gives up the position of vice-chairman and is succeeded by E. Healey, of W. A. Bates, Limited. After the chairman's remarks he was presented with a silver tea and coffee service which had been subscribed for by members of the Association.

Mr. Goudie referred to the fact that during his long chairmanship the membership of the Association had increased to such an extent that it now comprises 98 per cent of the production of the rubber industry in the United Kingdom. Reference was made to the restrictions on the import of American cotton duck while rubber goods containing it had been freely admitted. This anomaly, he stated, had now been removed. Mention was made of the recent increase in railway rates, the incidence of which he said would prove more of a hardship to rubber manufacturers than might be supposed by those who had only seen press references.

Emphasis was laid upon the need for an increased output from labor as now advocated by some of the more important labor leaders who are warning the workers not to be led away by revolutionary methods. A passing reference was made to a matter which is at present causing some controversy, namely, whether rubber garment makers are included in the five shillings per week advance granted to rubber workers by the Trade Council. This point has not yet been satisfactorily settled.

RUBBER SOLES.

As the price of boots keeps high, it is not surprising that the rubber composition soles are increasing in favor. A setback to their use has been that they have been largely barred by the bootmakers and repairers, and many people will not go to the trouble of putting them on for themselves. Moreover, they have not until recently been prominently on sale at a reasonable price. Now, however, permanent makes like the Wood-Milne and Macintosh can readily be bought in our towns at about 2s. 6d. a pair and shoemakers are ready to nail them on to the leather sole. The firms mentioned make higher qualities, but it was bound to come about, as in the older rubber heel business, that considerable variations in quality are to be met with on sale. Some firms will not touch the cheaper qualities, while others recognize that there is a demand for them.

A new firm in this line is Synthetic Leather, Limited, of Embee Works, Shearbridge Road, Bradford. Mr. Marshall, late of Wood-Milne, is managing director, and only a high quality sole is made, to retail at about 5 shillings a pair.

Another one-time prominent official of Wood-Milne, Walter Wild, having now been demobilized, in company with one or two others, has started the Victor Rubber Co., Limited, at Leyland, and is specializing on rubber soles. Some premises which will shortly be vacated by the Monarch Rubber Co., Limited, of Gladen Street, Bradford Road, Manchester, are to be taken over by the adjoining Rivofite Co., Limited, in order to extend their rubber sole business.

THE PROOFING TRADE.

Despite a general increase in costs of production, this branch of the trade is very busy. Although all classes of proofing are in demand, especially for stripping purposes, there has been a great spurt in the cheaper lines at close competitive prices. One

effect of this has been that the oil substitute manufacturers have had a much busier time than during the war. Let us hope that the results generally will prove satisfactory, though past history has many records showing defective work and complaints were much more rife in the lower cut lines of proofing than in the case of high-class proofing.

At the present time most of the retailers are having sales of mackintoshes and waterproofs at about half what is stated to be the usual price, i.e., the war-time price, and it is rather a nice question for the astute purchaser as to whether it is the better economy to buy a mackintosh of good quality two or three years old or a new one at the same price, but really of an inferior quality of proofing owing to the rise in cost of production. The case of waterproofs is not on all fours because they do not depreciate in wearing value by keeping, but styles change, hence they are now being offered at a considerable reduction.

The oil proofing business shows a renewed activity, the new Joco Works at Aumisland, near Glasgow, having taken up this branch energetically, although not many of our regular rubber proofers have touched it. This last remark applies also to the shower-proof garment trade. This class of proofing, which is largely concerned with wax, is mostly in the hands of finishers to the textile tenders in Lancaster and Yorkshire, as the calenders, etc., used in the finishing industry are readily adaptable to the wax proofing of cloth so largely used in India and other hot climates.

The name of Burberry's is well known to the sportsman and purchaser of expensive waterproofs, but details as to the production of the special cloth have in the past been known only to a few. Now, however, we are let into the secret by the acquisition by Messrs. Burberry of the cotton mills and business at Farnworth and Manchester of S. & J. Prestwick, who have been the makers and proofers of the Burberry clothes for about twenty years.

A new firm in the proofing trade is Carmac Rubber, Limited, of Huntershill Works, Bishopbriggs, Glasgow. The equipment is extensive in order to undertake proofing to the trade.

THE FEDERATED RUBBER GROWERS AND MANUFACTURERS LIMITED.

This company owns substantially the whole of the share capital of George Spencer-Moulton & Co., Limited, of Bradford-on-Avon and Wood-Milne, Limited, of Leyland, together with the Pundut Rubber Estates, and arrangements have also been entered into with Federated Textiles, Limited, to run a mill at Littleborough near Rochdale so as to insure the companies having an adequate supply of canvas for their tire production. Rubber footwear is also to be made in a new mill in course of erection at Littleborough so that the activities of the new company cover a wide range of the trade. For the purpose of financing these developments and for the acquisition of the control of the South African Rubber Manufacturing Co., Limited, as well as for general purposes, an issue of 500,000 six per cent cumulative preference shares of £1 each has been issued at par free of income tax up to 6 shillings in the pound sterling.

NEW MOTOR TAXES.

It is expected that the new tax for motor cars will be based on £1 per horse-power. This appears to have the support of the motor trade as the existing Treasury horse-power formula favors the smaller bore and longer stroke of the average British motor as compared with the larger and slower running American engine.

PEACHEY COLD CURE PROCESS.

S. J. Peachey was billed some months ago to give a paper before the Manchester Section of the Society of Chemical Industry, descriptive of his new process of cold curing rubber without the use of bisulphide of carbon and chloride of sulphur. It is now announced, however, that the paper which was to have been given on March 4, has been postponed to some unknown date, owing to certain circumstances which were not disclosed. I may say that the process is decidedly novel and of great prospective interest and the delay in publication may have something to do with the patent which I understand is being applied for.

GLUE IN RUBBER.

The use of pitch bodies in rubber seem to have been developed in America and now, according to the interesting article on the estimation of glue in rubber in the January number of THE INDIA RUBBER WORLD, glue must be added to the rubber analyst's worries, as it appears to have come to stay in American rubber mixings. I don't profess to be omniscient, and because I have not come across its use in rubber in England the statement must not be taken to mean that it is not already in regular use here. One thing against it, I imagine, is the rise in price which has occurred and the lower quality of the bone glue which is in the market to make up for the deficiency of hide glue.

In certain classes of goods glue and rubber come into close juxtaposition, but are not admixed. I notice that in "Crude Rubber and Compounding Ingredients," by Henry C. Pearson, it is stated that glue is used in bookbinder's cements, cheap frictions and cheap horse-cover compounds with rubber. This is interesting but presumably the "cheap" refers to pre-war days.

COLLOID CHEMISTRY.

This is not an inappropriate subject to come after glue, though the only thing I have to say here about this difficult matter is that it has been decided to found a professorship of colloid chemistry at Manchester University, the first professorship of its kind in the world. A sum of £25,000 is required for the endowment, of which I believe about one-half has been raised by cotton interests, Tootal Broadhurst Lee Co. being much to the fore in the matter. As far as local conversation goes, colloid chemistry means the chemistry of cotton, though readers of this journal have usually associated it with rubber, glue, resins, etc. It will be interesting to see to what extent the new professor will apply himself to problems connected with rubber.

ZINC SULPHIDE.

I was interested in a recent letter in THE INDIA RUBBER WORLD from a maker of zinc sulphide who stated that the works in California are ready to turn out much more if only the rubber trade would give the orders. That is the rub. Despite paragraphs in various rubber books extolling the virtues of zinc sulphide, the demand from the trade has hardly increased at all in the last thirty years, the total consumption being almost negligible, as rubber chemicals go in these days. Of course, in later years a good deal has been used in the compounded form of lithopone and it rather looks as if the extended use of lithopone is all against the employment of zinc sulphide to a greater extent, except in cases such as dental rubber where barytes would be quite inadmissible.

SLATE POWDER.

A company has been formed to market refuse Welsh slate in the form of a very fine powder for use in compounding in the rubber and other industries. Silicates such as fine white clays have certainly come into use in the rubber trade in the last few years to a greater extent than formerly and there may be a future for the new Welsh product.

WILLIAM BOYD STOCKER HAS BECOME CONNECTED WITH GEO. HANKIN & CO., 27 Mincing Lane, London, E. C. 3, in a responsible position. Mr. Stocker has been identified with the rubber, balata, and allied trades for a number of years.

FRENCH RUBBER ASSOCIATIONS.

THE FRENCH rubber manufacturers have not formed a single large corporation like The Rubber Association of America, but have preferred to join a series of groups comprising those interested in each specialty. The following is a list of these associations, with their addresses:

Chambre Syndicale des Tissus et du Caoutchouc (fabrics and rubber), 8 rue Montesquieu, Paris.
Chambre Syndicale des Linoléums, Toiles Cuir et Toiles Cirées (linoleums, artificial leathers, and waxed fabrics), 32 rue Ampère, Paris.
Syndicat de Toiles Cirées et Produits Similaires (waxed fabrics and like products), 11 rue de Turbigo, Paris.
Syndicat des Appareils de Chirurgie (surgical appliances), 20 rue Serpente, Paris.
Syndicat des Accessoires de Chirurgie et d'Hygiène (surgical and hygienic accessories), 163 rue Saint Honoré, Paris.
Syndicat de Fournitures d'Usines (factory appliances), 163 rue Saint Honoré, Paris.
Chambre Syndicale des Vêtements en Caoutchouc et Imperméables (rubber clothing and waterproofs), 163 rue Saint Honoré, Paris.
Syndicat des Antidérapants (non-skid devices), 39 rue de Châteaueau Landon, Paris.
Syndicat de Caoutchouc et de Linoléum (rubber and linoleum), 18 rue Duphot, Paris.
Syndicat des Fabricants de Celluloid (celluloid products), 7 rue du Jong, Paris.
Syndicat des Planteurs de Caoutchouc de l'Indo-Chine (rubber planters), Saigon, French Indo-China.
Syndicat des Planteurs de Caoutchouc (rubber planters), 48 Place de Meer, Antwerp.
Syndicat des Ingénieurs, Chimistes, Chefs de Fabrication et Contremaîtres de l'Industrie du Caoutchouc (union of engineers, chemists, factory heads and foremen in the rubber industry), 49 rue des Vinaigriers, Paris.

The most important associations are the Chambre Syndicale des Tissus et du Caoutchouc, of which Mr. Yung is president and which comprises all the great French manufacturers such as Michelin, Bergougnan, the Société Parisienne, the Société des Téléphones, etc., and the Syndicat des Planteurs de Caoutchouc de l'Indo-Chine.

THE RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

AMONG the many manufacturing industries which arose in Japan during the Great War, the rubber industry must be reckoned among the most promising. Before the war it had been developing gradually, but with the outbreak of hostilities the demand for Japanese rubber articles rapidly increased. Since then, too, the use of rubber goods has become more widespread throughout the Orient. Prior to the war South America, Canada, Australia, India, China and the South Sea Islands had been supplied with rubber articles of British or German make, but the opening of hostilities curtailed or altogether stopped these supplies. Consequently articles made in this country have come to be exported, especially balls, sheets, hose and toys. These articles had not before been extensively manufactured in Japan, but rubber manufacturers had to produce them to meet the home demand, and exportation followed as a natural consequence.

THE TOKIO RUBBER ASSOCIATION.

The first general meeting of this association was held on January 13, 1919, with many prominent officials in attendance, including the deputy of the Minister of Agriculture and Commerce. Since the establishment of the association a year ago its principal activities have been many and important.

On August 5 the officers' meeting was held at the office of the association, when it was decided to raise prices of general rubber manufactures by 20 per cent owing to high prices of naphtha, textiles and wages. But 20 per cent has not proved sufficient and urgent measures are required. Though it is difficult for all manufacturers to make uniform prices inasmuch as the prices must

vary according to the qualities of the goods, ball manufacturers are planning to fix prices uniformly.

A domestic exhibition in commemoration of peace was held at Ueno Park last summer. The Tokio Rubber Association exhibited products of the members, the Mitatsuchi Rubber Manufacturing Co., Nihon Rubber Co., Kyodo Rubber Co., and many other firms and dealers. These articles were well designed and nicely made to attract the attention of spectators, but unluckily the building took fire on August 21 and all exhibits were destroyed.

On May 22, the councillors' meeting was held, and regulations concerning condolences for deceased members were decided upon.

"The Rubber Times" ("Gomujihō-Sha") was recently organized by about twenty officers of the Tokio Rubber Association. It will be published monthly as the official organ of the association to promote the mutual benefit of members. It is expected that the first number will be issued on January 5, 1920.

The general meeting and an appreciation ceremony to reward 124 faithful employees who have served one firm over ten years without interruption, was held on January 11, at the Seiyoken Hotel at Tsukiji, Tokio. Most of the veteran employees rewarded are employed by the Mitatsuchi Rubber Manufacturing Co., the Nihon Rubber Co., and the Meiji Rubber Factory, as they are the oldest firms in Tokio and in Japan. Some of the employees of the Mitatsuchi Company have served over thirty years without interruption.

JAPANESE JINRIKISHA TIRES IN SHANGHAI

According to an investigation by the Shanghai Chamber of Commerce, it was about 1903 that pneumatic jinrikisha tires appeared in that city for the first time. They were made by the Dunlop Rubber Co. (Far East), Limited. Until the Great War this company monopolized the business except for a few German imports made in 1912 by the Continental Caoutchouc & Gutta Percha Co. After the outbreak of the war, some Japanese tires were imported, and fierce competition ensued with the Dunlop tires, the result being that at present all jinrikisha tires in Shanghai are of Japanese make.

Exceptional conditions have rendered an extension of this business difficult and unremunerative, but now that special tires are being made for the Chinese trade, better results are hoped for. There is more rain in Shanghai than in Japan, the rainy season lasting about four months, from April to July, and shortening the life of tires.

Roads, except the principal thoroughfares, are mostly bad, and some are pebbled, so that tire wear is excessive. Neither owners nor pullers of jinrikishas keep tires in good repair. Jinrikishas are continually used during both day and night. A seven months' guaranty is required. If the tires are damaged within that time, they must be exchanged for new ones. Most tires are damaged within seven months owing to the conditions under which they are used, and the margin of profit is therefore very small.

JAPAN'S PIONEER INSULATED WIRE FACTORY.

IN THE PRODUCTION of rubber-covered wire for all electrical needs Japan is steadily forging to the front. One of the biggest factories in the trade in the Orient is the *Fujikura Densen Kabushiki Kaisha* (Fujikura Insulated Wire and Cable Co.), 922 Sendagaya-Machi, Tokio. This concern was started in a humble way in 1885 by the late Mr. Fujikura, the pioneer in insulated wire making in Japan. He foresaw that his progressive country would share largely in the rapid, world-wide expansion of electric lighting, telegraph, telephone, and allied industries and installed modern machinery, introduced up-to-date processes, and constantly enlarged his staff of men skilled in chemical and electrical research work. Much credit is also due T. Matsumoto,

who succeeded Mr. Fujikura as president of the company, and to Kenzo Okada, known to many in the United States.

The concern adheres closely to the standards of the British Cable Makers' Association and the Japanese government to insure the maximum of efficiency in the products. Among the specialties manufactured is an ozone-proof vulcanized rubber cable designed to withstand the action of ozone, which even on

FUJIKURA INSULATED WIRE & CABLE CO., TOKIO, JAPAN.

the best rubber-insulated cables will slowly break down the dielectric coating when the gas is produced on the surface or the ends of the cables during the passage of high voltage currents.

Another product is the Fujikura patent okerite or minerite insulated wires and cables, said to be acid and flame proof, non-hygrosopic, unaffected by sea and mine water, requiring no lead covering, with high conductivity and low electrostatic capacity as well as being tough and pliable even below the freezing point.

FOREIGN CUSTOMS CHANGES.

CANADA.

CANADIAN DUTIES levied on rubber imports from the United States are as follows: Rubber tires, tire repair kits, tire valves and stems, 42½ per cent ad valorem. Rubber manufactures, rubber engine packing, rubber mats, 42½ per cent. Asbestos manufactures, asbestos brake lining, 32½ per cent. The preferential rates, allowed for British goods, on rubber goods is 22½ per cent.

PORTUGAL.

Portugal now permits the exportation of motor cycles and motor cars, with their tires, to the Portuguese colonies.

BRAZIL.

Brazil proposes to change the existing duty of 15 per cent ad valorem on tires to one of 200 reis (11 cents) per kilogram on solid tires and 600 reis (32½ cents) per kilogram on pneumatic tires.

NEW ZEALAND.

New Zealand now admits free of duty the impregnated cardboard discs, with rubber patch attached, that are a part of vulcanizer outfits.

HUNGARY.

Hungary permits the importation of india rubber, gutta percha and "the goods thereof" without a previous license.

IN 1918 THE DOMINICAN REPUBLIC IMPORTED RUBBER PRODUCTS to the value of \$143,976, compared with \$84,266 for 1917, the United States supplying goods worth \$137,804 and \$76,479 in the respective periods.

ISSUED FEBRUARY 11, 1920.

- 136,409. Elastic fabric. E. W. Pattison, 51 Deansgate Arcade, Manchester (Victory Corset Co., 20 Vesley street, New York City, U. S. A.).
- 136,410. Window-cleaning device. H. T. Girdlestone, 25 Glasshouse street, Hoxton, London, England.
- 136,483. Glove with hooded portion held in place by elastic band. T. Hilton, Brou-Ala, Mottram Road, Matley, Stralybridge, Cheshire.
- 136,421. Respirator. El Conde de Ramirez de Arellano, Bachelor's Farm, Horsham, Sussex.
- 136,731. Billiard cues. W. F. Coward, 60 Dean street, South Shore, Blackpool, Lancashire.
- 136,770. Infant's rubber pants. A. E. White, 88 Chancery Lane, London. (L. B. Kleiner, Rubber Co., 72 Broadway, New York City, U. S. A.). See THE INDIA RUBBER WORLD, December 1, 1919, page 157, for illustrated description.
- 136,792. Golf clubs with striking face of rubber between pieces of vulcanized fiber, etc. F. J. Percival, Golf Club House, Highcliffe, Castle Golf, Highcliffe, Hampshire.
- 136,802. Garter. R. Gorton, 143 Freeman street, Brookline, Massachusetts, U. S. A. (Not yet accepted.)
- 136,803. Garter. R. Gorton, 143 Freeman street, Brookline, Massachusetts, U. S. A. (Not yet accepted.)

ISSUED FEBRUARY 18, 1920.

- 136,916. Door mats composed of rubber rollers threaded on wires between metal scraper strips. G. Gibson, 17 St. Paul's Square, Bedford.
- 136,946. Cushioned spring wheels. E. Jacqmain and J. Kucharek, 19 Rue de la Plaine, Brussels.

ISSUED FEBRUARY 25, 1920.

- 137,066. Dust cap for tire valves. A. Schrader's Son, Inc., Brooklyn, N. Y., assignee of E. V. A. Myers, 82 Evergreen Place, East Orange, N. J.—both in U. S. A. (Not yet accepted.)
- 137,067. Dust cap for tire valves. A. Schrader's Son, Inc., Brooklyn, N. Y., assignee of E. V. A. Myers, 82 Evergreen Place, East Orange, N. J.—both in U. S. A. (Not yet accepted.)
- 137,097. Inhaler. L. Milan, 32 Via del Leoncino, Rome.
- 137,103. Pneumatic tires. E. H. Taylor, 92 Bennett's Lane, Smithills, Bolton, Lancashire.
- 137,139. Reinforced composite material in layers, containing rubber, etc. R. Russell, The Acres, Middleton, near Manchester.
- 137,140. Rubber cushion devices for vehicle doors. A. S. Cheston, Cheston, Widon, N. Y. Square, Birmingham.
- 137,143. Metal-studded rubber soles and heels with leather insets. R. T. Hull, Houghton Hall, Denton, Lancashire, and B. Mellor, Mottram New Road, Hyde, Cheshire.
- 137,165. Powder puff case of rubber, etc. F. A. Mousley, Priest Bridge, Mortlake, London.
- 137,222. Collapsible rim for tires. J. H. Miskimen, Glendive, Montana, U. S. A.

ISSUED MARCH 3, 1920.

- 137,253. Abdominal belt. H. A. Monin, 53 rue Petit, St. Denis, Seine, France.
- 137,306. Pneumatic tire. H. S. Blynt, Yale, Oklahoma, U. S. A. (Not yet accepted.)
- 137,309. Rubber sole protector. R. G. Fabregas, 3 Plaza Galvany, Barcelona, Spain. (Not yet accepted.)
- 137,328. Tube for ethyl chloride, etc., with rubber-padded stopper. A. Schrader's Son, Inc., Brooklyn, N. Y., assignee of H. P. Kraft, 219 Godwin avenue, Ridgewood, N. J.—both in U. S. A. (Not yet accepted.)
- 137,331. Tire valve. A. B. Norwalk, 740 Riverside Drive, New York City, U. S. A. (Not yet accepted.)
- 137,389. Rubber pads for soles and heels. W. H. Phipps, 57 Wick Road, and W. T. Hooper, 71 Repton Road—both in Bristolington, Bristol.
- 137,448. Golf-club handle with insertion of molded rubber beneath wrappings. J. S. Jones, Rosemont, Warbrick Hill Road, Blackpool.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 496,743. (March 8, 1919.) Valve for pneumatic tires. A. Schrader's Son, Inc.
- 496,770. (March 10, 1919.) Improvements in waterproofing materials and the process of manufacture. L. Kirschbaum.
- 496,788. (July 3, 1918.) Parachute having pneumatic device. A. Ramauze.
- 496,849. (March 11, 1919.) Improvements in solid rubber tires. The Dunlop Rubber Co., Limited.
- 497,069. Improved manometer for pneumatic tires. A. Schrader's Son, Inc.
- 497,375. (March 26, 1919.) Elastic fabric. Victory Corset Co., Inc. (February 21, 1919.) Valve for pneumatic tires. C. Carcinini. (April 9, 1919.) Improvements in resilient wheels. M. W. Peck.
- 498,047. (September 19, 1917.) Rubber tip for canes, crutches, furniture, etc. M. Tarlot, 29 rue Mogador, Paris.
- 498,410. (April 16, 1919.) Improvements in rubber heels. A. Bondon et Cie.
- 498,697. (August 25, 1916.) Improvements in coverings for pneumatic tires. Dussens and R. Hussey.
- 498,755. (April 29, 1919.) Improvements in wheels, especially those with pneumatic tires for automobiles. M. Kapferer.
- 498,767. (April 29, 1919.) Composition to plug automatically punctures in pneumatic tires. J. H. Jacobsen.
- 499,034. (May 6, 1919.) Cap for valves of pneumatic tires. A. Schrader's Son, Inc.
- 499,337. (May 9, 1919.) Valve for pneumatic tires. A. Schrader's Son, Inc.
- 499,337. (May 9, 1919.) Valve for pneumatic tires. A. Schrader's Son, Inc.
- 499,413. (May 12, 1919.) Pneumatic wheel. G. C. M. J. Lentz.

GERMANY.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 320,204. (July 13, 1917.) Elastic tire. R. Iwanowky, Mainz.
- 320,365. (April 7, 1916.) Pneumatic tire with reserve tubes. M. S. Stevenson, London, England.
- 320,723. (August 5, 1913.) Solid rubber tire. H. B. Clayson, Sydenham, London.
- 320,926. (October 31, 1918.) Hose coupling. E. Kessler, Basel, Switzerland.

AUSTRALIA.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 7,276. (May 8, 1918.) Motor tire cover. J. H. Gull, J. D. Rea and L. S. Solder.
- 7,328. (May 11, 1918.) Vehicle wheels and tires. J. R. Churchill.
- 7,340. (May 11, 1918.) Resilient tires. H. L. Harding.
- 7,341. (June 27, 1917.) Resilient tire. A. J. Geller and A. Kenny.
- 8,388. (August 21, 1918.) Cushion tires. C. W. Le Plastrier. (Morand Bros.-Martin Cushion Wheel Co.; W. C. Martin.)
- 8,900. (September 4, 1917.) Inner tube. J. B. Jeffries.
- 8,953. (March 28, 1918.) Tire valve. M. C. Schweinert.
- 9,686. (December 31, 1919.) Cushion wheel. C. W. Le Plastrier. (Morand Bros.-Martin Cushion Wheel Co.; W. C. Martin.)

NEW ZEALAND.

ISSUED DECEMBER 31, 1919.

- 42,544. Two-piece easily cleaned rubber mouthpiece for feeding-bottle, held in place by a扣, F. K. Graham-Yooll, Dulham Towers, East Trinity Road, Leith, Scotland.

TRADE MARKS.

THE UNITED STATES.

- N O. 96,047. The word *Unisco*—automobile fan belts, fabric belts, rubber or/and fabric hose, etc. (J. H. Baettner, Cincinnati, O.).
- 99,120. The word *FOSTER* in white and black letters against a red and gold background—rubber soles and heels. Foster Rubber Co., Kenilworth, Mass. and Boston, Mass.
- 106,343. The words *HELT* and *SHEET* within horizontal hexagonal inclosures placed to the right and left of a large letter *E*—packing made of asbestos fiber, rubber, and fireproof cement, in the form of gaskets. Eureka Packing Co., Sales Department, New York City.
- 107,773. The words *PUMP-KING*—one above the other, with a hyphen in front of the lower one—rubber belting. New York Belting & Packing Co., New York City.
- 109,994. Representation of a bar-leaved boy kneeling within and peeping out from a raincoat apparently on a support, topped by a rain-hat—waterproof coats, hats, suits and leggings. Union City Manufacturing Co., Union City, Tenn.
- 112,134. The word *OXYLAND*—rubber and fabric tires. United States Tire Co., New York City.
- 113,425. Representation of a lion repose above the words *LIOW PAW* Belting—rubber and fabric tires. Buckner Process Co., Worcester, Mass.
- 114,637. The word *GOZZETT*—asbestos composition packings. Goetze Gasket & Packing Co., New Brunswick, N. J.
- 115,257. The word *Senegal* beneath a lion couchant—impregnated canvas belting. The Kew-Indie Redway Belting & Hose Co., Seneca, N. Y.
- 115,657. The word *FARREL*—rubber machinery. Farrel Foundry & Machine Co., Ansonia, Conn.
- 116,950. The words *BI-LATRAL*—rubber-lined cotton-jacketed fire hose. C. M. C. Baird, Chicago, Ill.
- 117,767. The word *ARCTO* within a fruit-trail ring, hose, etc. Achilles Rubber & Tire Co., Inc., Birmingham, N. Y.
- 118,776. The word *LESTARY*—rubber stamps, etc. Century Rubber Stamp Works, New York City.
- 119,097. The word *VALUCA*—leather, rubber, and balata belting; asbestos, etc., valve and disk packings, and rubber hose. Pacific Mill & Mine Supply Co., San Francisco, Cal.
- 119,144. Representation of an oval figure formed of a black band—leather and rubber belting. The Manhattan Rubber Manufacturing Co., New York City.
- 119,191. The word *Uco*—jar rims. United States Rubber Co., New Brunswick, N. J.
- 119,879. The words *SAFETY*, *SERIES* and *SATISFACTION* within the representation of a tire, tubes and tubes. Automobile Owners Tire Corp., Sioux City, Ia.
- 120,166. The words *RADIO*—rubber and fabric tires. Ellis Miller, New York City.
- 120,538. Representation of a seal bearing the figure of a woman and the words *The Fabrics of PLATYMER* shoes, etc. for men, women, and children. Johnson, Stephens & Shinkle Shoe Co., St. Louis, Mo.
- 120,851. The word *GO-GUP*—self-vulcanizing patches. Moses Strause, San Francisco, Cal.
- 121,308. Representation of a leech bearing the words in white letters, *Sticks Like a LEACH*—tube patches. The Leach Patch Co., Indianapolis, Ind.
- 121,401. Representation of a circular seal with a globe in the center surrounded by 20 six-pointed stars within a circle, and outside the circle, the words *TIP MEXICATTAN RUBBER* for men, women, and children. Johnson, Stephens & Shinkle Shoe Co., St. Louis, Mo.
- 121,578. Representation of a shield bearing the initials *C* and *P* formed into a monogram, within two scrolls bearing the words *CHICAGO PNEUMATIC*, the whole conventionally decorated—rubber-lined cotton hose of different kinds, including wire-wound. Chicago Pneumatic Tool Co., Chicago, Ill.
- 121,979. The initials *S* and *K*—rubber repair patches for tires and tubes. J. F. Kirchner, Parma Township, Cuyahoga County, O.

- 122,394. The word **KAWEE**—sanitary baby pants. Maude Sinclair George, St. Louis, Mo.
- 122,719. The word **MAJESTIC**—rubber tires. The Majestic Tire & Rubber Co., Indianapolis, Ind.
- 122,832. Representation of a type of valves for tires, cushions, life-preservers, etc. Griffin Manufacturing Co., Boston, Mass.
- 123,202. Representation of a seal bearing the words **CONVERSE RUBBER SHOE CO.** on the arms of a large letter C forming the initial for the additional word **CONVERSE**—rubber boots and shoes. The Converse Rubber Shoe Co., Malden, Mass.
- 123,229. Representation of a seal rolling through the letter U and leaving an impression of its tread—fabric and rubber tires. Universal Tire & Rubber Association, Houston, Tex.
- 123,240. The word **COLO** within two concentric ovals, the inner one much heavier in outline lithopane. Collinsville Zinc Corp., Collinsville, Ill.
- 123,297. Representation of two elephants bearing against opposite sides of a globe, having a tug-of-war with their trunks; on the globe a monogram formed of the letters A. W. M. E. C.—elastic webbing. American Webbing Manufacturers Export Corp., New York City.
- 123,305. The words **THE OHIO SUSPENDER CO.**—suspenders, garters, and belts for personal wear. The Ohio Suspender Co., Mansfield, O.
- 123,480. The words **VULCO CORD**—rubber tires. The Gates Rubber Co., Denver, Colo.
- 123,563. Representation of an ornamental design incorporating the words **CENT BIRD**—BIRD GUM and the figures of two blue birds within conventionalized scrolls—chewing gum. Universal Products Co., Kansas City, Mo.
- 123,875. Representation of a seal bearing the words **CONSUM MFG. CO.** 221 LOCUST ST., PHILA., BEST OF ALL GUM—chewing gum. Consum Manufacturing Co., Philadelphia, Pa.
- 123,989. Representation of a seal bearing the words **LAUSSEN KAUSBERG FRUIT**—chewing gum. L. P. Laussen, Jr., Co., Chicago, Ill.
- 124,052. The word **DRICOTA**—raincoats. Edward Ripley & Son, Limited, Bradford, Eng.
- 124,264. The word **REVO**—rubber heels. Thomas M. Evans, East Providence, R. I.
- 124,265. The word **WIDS**—rubber or composition soles, heels, and taps. Fibre Products Co., Boston, Mass.
- 124,277. The words **MARA TROY**—rubber belts for personal wear. The Marathon Tire & Rubber Co., Cuyahoga Falls, O.
- 124,354. The words **LOOP-O-PLANE**—toy airplanes. Percy Pierce, Philadelphia, Pa.
- 124,420. The word **WONDERAWE** with end and center letters capitalized—woven elastics in the piece. Rice-Stix Dry Goods Co., St. Louis, Mo.
- 124,446. The word **NONAME**—rubber heels. Plymouth Rubber Co., Canton, Mass.
- 124,468. Representation of a round label bearing the picture of a cavalier bowing and the words **THE CAVALIER HOSE SUPPORTER** within concentric circles—hose supporters. Roy J. Cavalier, Oswego, N. Y.
- 124,996. The letters K, Y, and L formed into a monogram above the words **K-Y-L**—chewing gum, etc. Kechler Weyl Baking Co., Philadelphia, Pa.
- 125,255. The words **RIP X**—rubber cement, tread filler, tire tape, tire repair gum, and tread repair gums. St. Louis Rubber Co., St. Louis, Mo.
- 126,048. The word **WORTHMORE** in black letters on a white rectangle against a black diamond—suspenders and dress shields. McDonald Bros. Co., Minneapolis, Minn.

THE DOMINION OF CANADA.

- 25,715. The word **JIFFY**—rubber baby pants. The I. B. Kleintner Rubber Co., New York City, U. S. A.
- 25,729. The word **HYGEIA**—nursing appliances and nipples. The Hygeia Nursing Bottle Co., Inc., Buffalo, New York City, U. S. A.
- 25,735. Representation of a label in the form of a shield having an oval centerpiece bearing the figure of a beaver with a log; around oval are the words **CANADIAN CONSOLIDATED RUBBER CO., LIMITED, AND ASSOCIATED COMPANIES**; above the oval centerpiece is the word **RAYSTERN** in large letters—raincoats, rubber coats, and rubber clothing, etc. Canadian Consolidated Rubber Co., Limited, Montreal, Que.
- 25,742. The word **DIAMOND** and the representation of a diamond in a claw setting—rubber tissues, etc. Will F. White, Limited, Toronto, Ont.
- 25,803. The word **EXCLESIOR**—tire casings. Hercules Rubber Co., Limited, Brampton, Ont.
- 25,854. The word **REPUBLIC**—tires, hose, machinery packing, tires, tire casings, and inner tubes. Republic Rubber Corp., Youngstown, O.

Distribution

The New Tire and Rubber Center in Minneapolis has solved the problem of distribution in the Northwest.

- ❑ Located on *all* the Railroads entering Minneapolis and serving the Northwestern States and Western Canada.
- ❑ Direct tunnel connection with Station for *all* LCL freight, Express and Parcel Post—Operated by the Northwestern Terminal Co.
- ❑ 80 per cent of the entire floor space now nearing completion already leased to Goodyear, Firestone, Goodrich and other strong rubber companies.

Review of the Crude Rubber Market.

NEW YORK.

THE CRUDE RUBBER MARKET remained firm and quiet throughout March, with two or three slight breaks in which the prices advanced or receded a cent or two. There was some trading among dealers; the manufacturers, however, did little buying.

Parás are picking up a little. Prices at the end of the month are very nearly the same as at the beginning, in spite of the partial recovery in exchange and the very large arrivals of crude rubber. This probably all goes to fill forward orders.

Prices for plantation and South American rubber at the beginning and toward the end of the month are shown in the following quotations:

PLANTATIONS. March 1, first latex crépe, spot 46½ cents; futures, April-June, 47½ cents; July-September, 48½ cents; July-December, 94½ cents; March 25, spot 47½ cents; April-June, 49 cents; July-December, 51 cents.

March 1, ribbed smoked sheets, spot 46½ cents; April-June, 47½ cents; July-September, 48½ cents; July-December, 49½ cents; March 25, spot, 47 cents; April-June, 49 cents; July-December, 51 cents.

March 1, No. 1 amber crépe, spot, 46 cents; April-June, 46½ cents; July-December, 47 cents; March 25, spot, 46½ cents; April-June, 47½ cents; July-December, 48½ cents.

March 1, No. 1 rolled brown crépe, spot, 39 cents; March 25, spot, 40 cents; April-June, 40 cents; July-December, 40½ cents.

SOUTH AMERICAN PARÁS AND CAUCHO. March 1, spot prices: upriver fine 42 cents, islands fine 42 cents, upriver coarse 31½ cents, islands coarse 20½ cents, Cameté coarse 21½ cents, cauchó ball 31½-32 cents.

March 25, upriver fine 42-42½ cents, islands fine 42½ cents, upriver coarse 31½ cents, islands coarse 21½ cents, Cameté coarse 22 cents, cauchó ball 32½ cents.

NEW YORK QUOTATIONS.

RECLAIMED RUBBER.

Essentially the same conditions which prevailed in the reclaimed rubber market during February controlled the situation of reclaimed in all grades during March. Reclaimers are oversold for from two to three months, consequently are not seeking business. Prices, however, have not been advanced and remain as reported last month. Current buying is in relatively small volume and large users are not seeking to make commitments beyond the middle of the year.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Allart B. Berry, broker in crude rubber and commercial paper, No. 68 Wall Street, New York City, advises as follows:

"During March there has been a fair demand for paper from out of town banks, and early in the month the best annual yield of 6½ per cent, but the latter part of the month the minimum rate has been 7 per cent, and considerable amounts of paper have been offered at 7½ per cent."

SINGAPORE RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report (February 12, 1920): At the usual weekly rubber auctions held yesterday and to-day, prices showed slight declines from those of last week. Fine pale crepe realized up to \$1.12½ (two lots sold at \$1.13½) or 1½ cents down, while ribbed smoked sheet sold at \$1.13½ (three lots sold at \$1.14) or ½ cent below last week's figure. The lower grades showed reductions of ¼ cent. The quantity catalogued was 857 tons, of which 753 tons were offered and 527 tons sold.

The following is the course of values:		Sterling Equivalent	
	In Singapore, per Pound.	Per Pound in London.	
Sheet, fine ribbed smoked.....	110 3/4 @ 113 1/2	2/9 1/2 @ 2/10 1/2

AMSTERDAM MARKET REPORT.

JOOSTEN & JANSSEN, Amsterdam, report (March 12, 1920): The market remained quiet at the beginning of March, when it became very lively and a large business was done at rising prices. Practically all parcels in the auction catalog of inscriptions, postponed on account of the strike, were sold, as well as considerable quantities of rubber in port, but not unloaded.

The highest price paid for first quality Hevea, spot, was 1.146; the lower grades in proportion. There was a large turnover also in the terminal market, the highest price being 1.150 for July and August deliveries.

ANTWERP RUBBER MARKET.

GRISER & CO., Antwerp, report (March 5, 1920): At a rubber auction held in Antwerp on February 19, 1920, the first since November, 1919, 618 tons were sold out of 900 tons offered. A small lot of Congo plantation Hevea rubber brought 14.45 francs a kilo, while the Malayan plantation rubber put up in the same sale, brought from 14.30 to 14.40 a kilo, which seems to show that the Congo cultivated rubber, properly prepared, can hold its own with the Far Eastern product.

The highest prices obtained for other African varieties were:		Francs per Kilo.	
Upper Congo, equatorial, black.....	8.8 1/2	7.35 @ 8.5 1/2	
Upper Congo, Aruvimbi.....	8.1		
Kassai black.....	8.1		
Kassai red Loanda II.....	5.97 1/2		
Wamba black.....	8.3 1/2		
Yakoma.....	14.45		
Congo plantation Hevea.....	14.45		
Straits Settlements smoked sheet.....	14.30 @ 14.40		

The stock on hand in Antwerp is about 521 tons. The recent drop in prices was due to the fall in exchange, but the tone has grown steadier in the last few days. Business was brisker and sales amounting to 140,000 kilos were registered. Price at closing was 13.95.

THE MARKET FOR RUBBER SCRAP.
NEW YORK.

EARLY IN THE MONTH the rubber scrap market labored under adverse conditions such as shipping difficulties and lack of interest on the part of reclaimers in anticipation of lower prices incident to the spring collections of tires and shoes. Already there is a decreasing firmness noted in the prices asked for both these grades.

The crude rubber market has been quiet and there has been no beneficial effect on scrap rubber. Consumers of scrap are favoring the scrap at present which is a good thing for the trade in view of the tremendous supplies in that line.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

AMERICAN COTTON. The market for cotton has continued to be remarkably dull, sales being recorded on two days only. The spot price for middling uplands cotton was 40 cents on

March 1, it rose gradually through the next ten days to 41 cents and stayed at that price without variation and with no sales for nearly two weeks; at the end of the month there were fluctuations, the price going to 43.25 cents on March 23, and dropping again to 42 cents, the price quoted March 24. The boll weevil is apparently spreading throughout the South. The English threat of ceasing to purchase American cotton has not been taken seriously on either side of the Atlantic.

EGYPTIAN COTTON. During February the Alexandria market fluctuated violently, owing to speculation, largely among the native merchants. The prices were so high that export houses ceased to deal in futures. They are believed to have practically filled all their contracts. The actual sales have been very small and the spot market dull, Sakellarides bringing \$3 to \$4 above the future price toward the end, though \$8 to \$10 more was paid for it in the middle of the month. The extreme future prices reached for March delivery were \$198 and \$165 per cantar, the last quotation being \$181.50 for March and \$140 for November. There is no doubt that there is a shortage of Sakellarides that can be delivered and spinners and exporters are holding off until the market settles.

During the last week of March it was reported that Sakellarides has recovered, after the recent decline, and is holding firm in Alexandria at \$137 for the better grades. This growth still remains dear with a high basis over contracts, but uppers and brown cottons are neglected.

ARIZONA COTTON. This year's crop of Pima has all been sold with the exception of a limited number of bales of very low grade cotton of indifferent staple. The last prices were around \$1.05. Seventy cents a pound has been bid in Arizona for new crop cotton without bringing any response. New crop has been offered in the East at \$1.02 with like results. Reports from Phoenix indicate a somewhat increased acreage for next season and optimists are predicting a 50,000 bale crop.

SEA ISLAND COTTON. Price for average extra choice is now \$1.10 with very little cotton offered. It is probable that there will be sufficient demand between now and new crop to absorb practically all of the stock on hand. This means no carry-over into next season. A very small acreage will be planted next year in South Carolina, Georgia and Florida to Sea Island cotton. Probably the crop will not amount to more than 9,000 bales.

DUCKS AND DRILLS. The market continues firm, the demand being much greater than the supply, as will continue to be the case so long as there is a scarcity in the raw material. The high prices continue to be quoted without a notable change.

RAINCOAT CLOTH. The trade has been rather quiet as manufacturers have enough stock on hand to keep them going for some months to come. Prices have advanced, however, because large gray goods operators are buying heavily, both spot and futures.

SHEETINGS. After a lull of some weeks buying has started again and the buyers are finding that goods for near delivery are scarce. All the mills are busy and have orders for all they can do comfortably for some time to come.

TIRE FABRICS. The market for tire fabrics is practically at a standstill, as there are no goods for sale and none are to be had for from four to six months from now. What sales occur are only of odd lots. No dealers are covering 1921 owing to the high prices demanded. The yarn manufacturers ask exorbitant prices and the fabric manufacturers who buy their goods must add these prices to their own.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE ACTIVE DEMAND and short supply which characterizes practically the entire list of rubber workers' chemicals and compounding ingredients has resulted in a sellers' market greatly to the disadvantage of the consumers.

In some lines producers complain that consumers are yielding to the short supply condition and are ordering beyond their requirements which forces producers to cut down requisitions or to raise prices.

Lead pigments have advanced owing to condition of the pig lead prices. Relief can come only with increased output of the metal, and is expected shortly.

The condition of the rubber trade as regards the supply of hexamethylene-tetramine, the popular organic accelerator, is one of acute shortage. The material is widely distributed to users in very limited amounts and at extraordinarily high figures, as high as \$3 per pound being paid. Deliveries on contract business are made at prices current at the date of shipment. The restricted output is attributable to the short supply of formaldehyde and wood alcohol.

ANILINE OIL. Stocks are small and prices firm, tending upward.

BARYTES. The stock shortage seems to be contingent on car shortage which is not susceptible to rapid improvement. Other production difficulties are apparently being eliminated.

BENZOL. Makers are able to supply the bulk of the demand which is fairly heavy. Prices are easier, 90 per cent is quoted 25 cents per gallon.

BLACKS. The situation with regard to both lampblack and carbon black is acute. The supply is not equal to the demands of consumers. It is reported that rubber manufacturers have been forced to substitute graphite wherever possible.

DRY COLORS. Imported earth colors are somewhat scarce. Interest centers in the volume of European shipments, particularly from Germany.

LITHARGE. The demand is very active and supplies insufficient. A rise of one-half cent per pound was made about the middle of the month.

LITHOPONE. Output is booked months ahead. Spot stocks are very small. Producers are not contracting and prices have been advanced to eight cents for car lot.

SUBLIMED LEAD. As with other lead pigments, the supply is inadequate to the demand. Early in the month an advance of 7-cent per pound took effect. Producers are endeavoring to stabilize prices which are dependent on that for pig lead which has continued to rule high.

SUPPLIER. The demand is steady at firm prices.

WHITING. Stocks are low and receipts of chalk not satisfactory.

ZINC OXIDE. There is a vigorous demand at firm prices.

SUBSCRIPTION: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE METRIC MENACE.**

FORCEFUL AND EMPHATIC are the arguments presented by representative American manufacturers to the Committee on Coinage, Weights, and Measures of the United States House of Representatives against the introduction at this time of metric legislation. There is neither urgent need nor widespread demand, it is contended, for any such radical change; and what agitation there is for measurement with decimal units is fostered rather by academical enthusiasts than practical producers and thoroughgoing trade builders. While the metric system, in itself, is unobjectionable and, indeed, like our American decimal coinage system has much to commend it, its introduction at this time would be inopportune; and such a "reform" might be very hurtful to many American industries.

One prominent manufacturer says that the adoption of such a system would mean the spending of millions of dollars and the injection into American business of more confusion than could be overcome in a generation. Indeed, he says such a change would be little less than a commercial calamity. That the introduction of such a sweeping change in standards would slow up produc-

tion at a time when greater output than ever is needed is self-evident; and if for no other reason our national lawmakers might well postpone action on the proposed metric legislation.

An automobile concern which exports to all parts of the world a large part of the \$60,000,000 worth of vehicles produced by it annually, freely states that it has in no way been adversely affected by the use of the current standards of length, weight, etc. Other large concerns testify that not only do they suffer no disadvantage in making extensive foreign sales, but were they compelled to adopt the metric system they would positively lose hundreds of thousands of dollars a year and might even be forced out of business.

Objection is made, too, to the unnecessary and expensive hearings on the subject on which a vast amount of data is available in America and England; and to coercing manufacturers into adopting a system which they may under existing laws accept voluntarily whenever such course is plainly to their advantage. As over half of the export of America's manufactured goods is bought by English-speaking people, all of whom use the inch standard, plainly it would be more to the advantage of the United States to act in concert with other countries using the same standards of measurement in any scheme for improvement than to "go it alone." Alert foreign rivals might easily reap a huge advantage while America would be making a troublesome change.

WHAT MACHINERY HAS DONE FOR RUBBER.

THAT the business of the twentieth century is founded upon labor-saving machinery as much as upon labor, and even more, is a fact. To catalog the many steam and electric machines and tools that do what the workman once accomplished would be in itself a great task. Not only do they spare and supplement labor, they save time, and materials, decrease working hours, increase the productivity of working hours, cheapen the cost of articles, increase the consumption of commodities and bring comfort to millions.

Charles P. Steinmetz in "America and the New Epoch," says: "One hundred years ago the average workday was ten to eleven hours. Now it is eight to nine hours. It has decreased about 20 per cent. The productivity of work in these 100 years, by the steam engine and the number of inventions and improvements following it, has increased at least tenfold—probably more nearly twenty to thirtyfold—but for illustration let us assume only a tenfold increase. Thus with an average of one hour's work during the day we could now produce as much as we did in ten hours, a hundred years ago."

This is just as true of rubber as of any other industry. The mixing batch of the days of Goodyear on a small belt-driven mill gave a product of forty pounds an hour. The ninety to a hundred pound batches on the modern high-speed mill easily produces four or five hundred

pounds in the same time, or if the mixer handles two mills, twice as much.

Along the line of time saving is the vacuum dryer for washed rubber. Three hours does what air drying took three months to accomplish. (Some of the ultra conservative let Pará rubber hang a year to dry and "age".)

These are but two of hundreds of instances applicable to all lines of rubber manufacture. Nor has this sort of progress reached its limit. Particularly in tire manufacture scores of special machines are created every month. Verily the debt of the rubber trade to the inventor and mechanical engineer is a big one.

LOOKING AHEAD IN CRUDE RUBBER.

ONE of the most far-sighted of the big rubber manufacturers predicts a shortage in crude rubber by 1924. He bases it upon the present production of rubber plus the increase figured on past experience. Against this he puts the constantly increasing use of rubber, chiefly in automobile and truck tires. This should not give pause in tire manufacture but should lead to provision for more crude rubber. Indeed it probably will result in greater planting areas in the Far East and possibly in the Philippines.

Again comes up the thought of rubber within our own borders. The work that is being done in the guayule propagation is of this sort and deserves and will probably win success. There should be, however, constant work upon other producers, if possible of native origin. The fact that wild *Chrysothamnus nauseosus*, which is so abundant in the mountain regions of Western North America, showed 6.57 per cent of rubber argues at least 10 per cent under selection and cultivation. If only rubber enterprise, backed by rubber money, would take up this very promising lead it would be most gratifying and probably successful.

THE FACTORY TRAINING SCHOOL.

A STRIKING OBJECT LESSON to industry is the training school for executives and salesmen maintained by the Westinghouse Electric & Manufacturing Co. For years it has been conducting such an educational institution on a constantly broadening scale and with marked benefit to the men and advantage to the company. The students for the courses are selected from among technical graduates of leading schools and colleges, about 450 being enrolled for the 1920 classes. After a year of intensive instruction the students are given positions in various departments. They come from all parts of the world and many return home as foreign representatives of the concern.

Not the least important part of the system is the training of the machinists' apprentices, the course being available for any boy of sixteen who has had a fair schooling. The key-note of the system is "broad training and education and later specialization." The company spares no

expense in providing competent instructors, class-rooms equipped with the most perfect material and the highest grade machinery, and in striving to make the courses interesting and thoroughgoing. The boy who completes the four-year term is assured a permanent position and is able to operate any machine in the works, an accomplishment hitherto possessed by scarcely two per cent of the mechanics of the country.

RUBBER PATENT LEATHER WANTED.

AMERICAN MANUFACTURERS of glazed kid or patent leather extensively used for fine shoes are worried over the action of India in levying a 15 per cent tax on all raw skins exported to countries outside the British Empire. They claim that it sounds the death knell of the glazed kid industry in the United States, and the transfer of the manufacture to the Canadian shops. These have the advantage of a 10 per cent rebate of the tax, as the Dominion is part of the British Empire, and can therefore undersell the United States product. As the Indian tax amounts to \$3 a pound, and as American manufacturers import from India 42 per cent of the raw skins used, a sure result will be higher prices for shoes and leather goods. Apparently the sole recourse would be to supplant glazed kid as far as possible with some rubber-coated fabric made to resemble the expensive leather article. Rubber will be equal to the occasion if called upon, nor will it be the first time that it has stepped into the breach, and with an adequate substitute either saved a threatened industry or at least averted a certain loss in trade.

NO PHANTOM OF HOPE, NOT EVEN THE SECRET OF perpetual motion or the transmutation of base metals into gold, has been pursued more eagerly than the solution of the problem of the non-pneumatic resilient wheel. Among the hundreds of American tire patents issued yearly is always a fair sprinkling of patents for rubber tire substitutes, generally in the form of metal springs to be set around the wheel hub, in the spokes, or in the rim. Ingenious many of them really are, but few give even the smallest promise of standing the rigid tests of practicability. Still the search for the substitute will go on. The failure of one inventor seems but to act as a spur to others in seeking the incalculably rich prize that surely would be bestowed on him who really provides for vehicles a wheel as buoyant as the present air-inflated type, but more enduring and economical. Nevertheless, an intimate study of all the devices thus far produced affords little on which to base the belief that the rubber tube filled with compressed air and its protecting casing will be deposed from the eminent place they occupy in the vehicle world.

DENTISTS CLAIM THAT THE LITTLE ROLLS OF COTTON dam are driving rubber dam out of the market. Just one d— thing after another.

The Metric System Applied to the Rubber Industry.

By C. C. Stutz.¹

AT THE PRESENT TIME a great deal is being written in the technical and industrial press of the country on the introduction of the metric system into the business affairs of the nation. Newspaper articles are also appearing on the subject, some laudatory of the system and some condemning it. It is being discussed from many angles. Both information and misinformation is quoted and enlarged upon.

This agitation in favor of the metric system has become of late more persistent. Investigation has shown that determined efforts are being made at Washington to induce Congress to pass laws for the "compulsory" use of the metric system of weights and measures. Members of both Houses of Congress have received a deluge of communications urging enactment of compulsory metric legislation and in the absence of opposition the opinion may be formed that such sentiment actually exists. Right here we must remember that the use of the metric system is legal in the United States, and has been so since 1866. Any one, therefore, is at liberty to use it. There is no objection to such voluntary use.

Should "compulsory" legislation be passed it would mean that after a period of say, two or three years, it would be obligatory under penalty to use only the metric system and to discard our present English system. Such a change may appear simple in the abstract, yet touching as it does the every-day affairs of everybody without exception, it contains large potentialities for mischief. For this reason it is wise to look into this problem by giving a brief outline of the metric system itself, and then taking up the conditions that such a change would create, first in a general way and second, how it would affect the rubber industry. After that, the advantages claimed for the metric system will be considered.

THE METRIC SYSTEM.

The metric system was, no doubt, at the time the eminent scholars conceived it, an earnest effort to create a scientific system of weights and measures. Unfortunately in those days industrial development was in its infancy and the men charged with the task having no practical considerations to guide them brought out a system based purely on scientific lines.

¹C. C. Stutz, a mechanical and electrical engineer with thirty-four years' professional experience, the greater part of which was devoted to development work here and abroad, was educated in Switzerland and brought up to the use of the metric system. On coming to the United States he became a naturalized citizen, familiarized himself with the English system of measurement and has used it alternately with the metric during the days aggregating from five to twelve years.

Since then conditions have changed. Industry has claimed an increasingly important position and has enlisted in its service an ever growing number of individuals. This multitude of artisans, in whose hands any system of measurements is but a tool like any other, has progressed or lagged behind according to the handiness and convenience of the system imposed upon it. To-day the great industrial nations are the United States and Great Britain, both of which have resisted the introduction of the metric system as an implement lacking the qualities so necessary for rapid development. This does not imply that the

English system of measurements is perfect. Some of its units and subdivisions have become obsolete by disuse. This is as it should be. It is a matter of evolution and growth stimulated by experience and changed conditions, and applies to most criticisms of this system.

The accompanying illustration shows some relative comparisons of English and metric units of length and volume. A study of Inch-Foot-Yard and Centimeter-Decimeter-Meter will show at once that the former three dimensions harmonize perfectly for practical use, while in the latter the unit subdivisions of the meter represent too great a step from the meter itself. In the "inch" and "centimeter" the same defect is apparent to which is added the "indivisibility" of the centimeter as compared with the inch. To the mathematician this is a matter of indifference, but not so to the workman. Divide the inch into 1000ths and the millimeter into 100ths, as required in work of precision, and the metric unit is too small. There is no metric unit comparable with the "foot." This English dimension is used so universally that it would be a hardship to use the meter in its place. Similar observations hold good for measures of volume and weight.

Briefly stated the metric system is devoid of the English system's handiness and convenience; its units are either too large or too small for the every-day requirements of industry.

GENERAL RESULTS FOLLOWING ADOPTION OF METRIC SYSTEM.

Irrespective of the merits of the metric system, its compulsory adoption will in a general way affect the whole country.

SOME RELATIVE COMPARISONS OF ENGLISH AND METRIC UNITS OF LENGTH AND VOLUME.

For instance:

(1) A long transition period will be required for changing from one system to the other. As matter of fact old units never disappear. Even in France after 83 years of compulsion the old units are still largely used in the textile industry. The same is true of many South American countries.

(2) A long transition period means the daily use of a dual system. Not only will familiarity with both systems be necessary but it must also be remembered what relation similar units in the two systems bear to each other. As for instance: 1 pound = 0.4536 kilogram and 1 kilogram = 2.2046 pounds.

(3) A great confusion between the two systems is bound to occur, because education is a slow process. This means of

Turning to the factory proper where rubber goods are made, a variety of machines, methods and processes are encountered which will all be affected. These are washers, dryers, mixers and grinders, masticators, cement churns, calenders, spreaders, presses and vulcanizers, tubing machines, etc. All this machinery will have to be made to the metric system; its sizes, capacities and output will carry metric designations, and the goods turned out will be called for in metric dimensions. New machines will be built to fit the new metric dimensions to which the goods may have been changed, but the older machines still hale and hearty may in some cases be obliged to work to reduced capacities, should it not be possible to enlarge them to increased metric dimensions. And should these dimensions be

TABLE OF EQUIVALENTS.

English	to Metric.	Metric	to English.
1 inch	= 25.4 millimeters	1 centimeter	= 0.3937 inch
1 square inch	= 6.4516 square centimeters	1 square centimeter	= .155 square inch
1 foot	= 304.8 millimeters	1 meter	= 3.2808 feet
1 yard	= 914.4 millimeters	1 meter	= 1.0936 yards
1 square yard	= 8.361 square millimeter	1 square meter	= 1.196 square yards
1 gallon	= 3.7853 liters	1 liter	= .2642 gallon
1 quart	= .9463 liter	1 liter	= 1.0567 quarts
1 pound	= .4536 kilogram	1 kilogram	= 2.2046 pounds
1 long ton	= 1.016 metric tons	1 metric ton	= .9842 long ton
1 short ton	= .907 metric ton	1 metric ton	= 1.1023 short tons
1 pound per square inch	=	0.07031 kilogram per square centimeter	
1 kilogram per square centimeter	=	14.2228 pounds per square inch	

course errors, claims, expense and misunderstandings, if not worse.

(4) The discarding of all measuring tools and weighing appliances. This means not only the changing of habits for every individual, man or woman, but it also brings home to them the expense involved. The cost to the transportation companies, the industries and all merchants cannot be calculated.

(5) The recalculation and establishing of new prices for every commodity raised and manufactured to conform to the new standards of length, weight and volume.

(6) All standard goods called for in the new language will be expressed in odd dimensions, as a 7-inch channel will become a 177.8-millimeter channel. To avoid odd dimensions it can be made a 175-millimeter channel, using the multiple of 25 as is done abroad. The result will be the restandardizing of goods, a prospect almost hopeless, when the time and effort required to establish the present standards are considered.

(7) The cost involved in the change becomes appalling and the time required will cripple the industries for years, during which time they will be further handicapped by a flood of importations, thus playing into the hands of foreign competitors.

SPECIFIC RESULTS FOLLOWING ADOPTION OF METRIC SYSTEM.

The metric system in relation to the rubber industry will now be considered.

FACTORY EQUIPMENT: Factories for the production of rubber goods use a certain amount of standard equipment such as boilers, steam engines, electric generators and motors, pumps, hoists, valves, shafting, hangers, pulleys, pipes, screws, bolts, nuts, etc. Once the metric system is compulsory, replacements and additions are obtainable only in the new sizes. To fit these to the existing lay-out will be a task for any master mechanic, even should he be a metric enthusiast. Break-downs under such conditions will take on a more serious aspect.

reduced from present ones the same observation fits the case. Only maximum output per machine spells economic production.

COMPOUNDS: While the machines themselves with their upkeep, repair and replacement present a problem, a more serious one is encountered in the question of rubber compounding. The ingredients are mixed according to weight. This means, to begin with, the changing of all scale-beams and runners or weights. The number of compounds used in the rubber industry is legion. Not only do different types of articles require different compounds, but the same article, an automobile tire for instance, is made from several compounds. A typical one follows:

AUTO TIRE TREAD—BLACK.

	Pounds.	Kilograms.
Fine Pará	45	= 20.412
Zinc oxide	25	= 11.34
Carbon black	10	= 4.536
Mineral rubber	6	= 2.7216
Aluminum flake	11	= 4.9896
Sulphur	3	= 1.3608

100

The equivalents in kilograms are given for all pound figures in the 100-pound batch. The size of batches varies from about 100 to 300 pounds, according to the capacity of the mixers.

The composition of a compound is the result of extended experience along the path of which many failures have made themselves felt. It is, therefore, not a matter to be trifled with. To translate the figures in use into metric values—and thousands will have to be so recalculated—means the use of decimal fractions of a kilogram. The fact that these are called "grams" does not alleviate the situation, for what superintendent would feel safe in giving his workmen such metric figures to work to? The smaller the batch the greater the danger of inaccuracy.

The trouble of course lies in the fact that the pound and the kilogram bear an unsatisfactory relation to each other. The Bureau of Standards gives this relation as:

1 pound = .4535924277 kilogram; the present writer has used:
1 pound = .4536 kilogram.

SPREADER GOODS: When fabric is to be covered or "spread" with rubber the calendar man is instructed to spread a certain weight of rubber per yard of fabric, this depending on the width of the goods. For every pound per yard he will now spread 496 grams per meter of length, because:

1 pound = .4536 kilogram and 1 yard = 1.0936 meters, and
 $1.0936 \times .4536 = .4960569$ kilogram, or 496 grams.

VULCANIZING: The vulcanizing of rubber is done with steam at pressures varying from 40 to 75 pounds per square inch, and so the gages read. In the metric system the steam pressures are expressed in kilograms per square centimeter. Inasmuch as:

1 pound per square inch = 0.07031 = kilogram per square centimeter, equivalent readings on the gage now in use and the metric gage compare as follows:

Present (English) Gage.	Metric Gage.
Pounds	Kilograms
40	2.8124
45	3.1635
50	3.5155
55	3.8670
60	4.2186

As metric gages will be marked to even kilograms and probably to 10ths of kilograms, a latitude is left to the workman in guessing the pressure he has worked to heretofore.

When the metric gage reads kilograms:

The pressure in pounds per square inch would be:	
3	42.6885
3.5	49.7799
4	54.5913
4.5	64.0027

Those familiar with vulcanizing will readily agree that absolutely no guessing is permissible in this operation. Therefore special gages would be required, which, while reading to metric figures, are calibrated to actual English pressures. Similar observations hold good for the testing departments and need not be enlarged upon. Of course a new set of gages, scales and measuring tools would have to be installed.

The superintendent will have his troubles in educating his men, but with patience it may be accomplished, provided he himself has first become proficient. His real difficulties will come when he has to use compound figures, such as pressures in kilograms per square centimeter; when fabric specifications are changed, giving new widths to be covered by rubber to the same thickness as on the English width fabrics, etc.

CRUDE RUBBER: While the factory manager and the men in the shop are wrestling with their problems the purchasing agent in his office will be confronted with his own difficulties. Crude rubber is bought by the long ton, 2,240 pounds, and the prices are given in cents per pound. Supposing he needs 50 tons and the price is 47 cents: 1 long ton = 1.016 metric tons, therefore 50 tons = 50.8 metric tons, 1 kilogram = 2.2046 pounds and $2.2046 \times 47 = \$10.36$ per kilogram.

The crude rubber importer, dealer and broker are equally affected; their contracts are changed to metric figures and so are prices, bills of lading, manifests and the whole system of book-keeping.

COMPOUNDING MATERIALS: This holds good for all compounding ingredients, sundry supplies, solvents and oils. These are received in bulk, some in barrels, kegs and some in steel drums. And all these varied containers will be known according to metric figures, the goods themselves billed and paid for in like manner.

FABRICS: Supposing the purchasing agent in need of fabrics looks up quotations on carriage cloth, duck, sheetings, and tire fabrics. They will appear unfamiliar to him in their metric

designations. The following calculations are made to show the work involved in changing these simple looking quotations from the English to their metric equivalents.

(A) Carriage cloth duck:

38-inch 2.00-yard enameling duck.....yard \$0.46

This quotation interpreted into every-day language means that the cloth is 38 inches wide and that a piece 2 yards long weighs 1 pound, and the price per yard of length is 46 cents.

To convert this into metric figures:

38 inches = $38 \times 2.54 = 964.2$ millimeters.

To find the length of cloth weighing 1 kilogram:

1 kilogram = 2.2046 pounds and 2 yards of cloth weigh:

1 pound,

then $2.2046 \times 2 = 4.4092$ yards in 1 kilogram.

Since 1 yard = 914.4 millimeters and 1 meter = 1.0936 yards,

$4.4092 \text{ yards} = 4.4092 \times 914.4 = 4.032 \text{ meters} = 4 \text{ meters } 32 \text{ millimeters.}$

If one yard costs 46 cents, then

1 meter costs $1.0936 \times 46 = 50.3$ cents.

The quotation now will read:

964-millimeter, 4.032-meter enameling duck.....meter \$0.50.3

(B) Sheetings, 40-inch:

48 × 48, 2.35-yard.....yard \$0.36

The quotation tells us that this fabric has 48 warp threads and 48 filler threads per inch. The fabric is 40 inches wide, a piece 2.35 yards long weighs 1 pound, and the price per yard of length is 36 cents.

To write this quotation in metric figures, centimeters will be used instead of inches, meters instead of yards and kilograms instead of pounds.

1 inch = 25.4 millimeters. (1 centimeter = 10 millimeters.)

40 inches = $40 \times 2.54 = 1016$ millimeters = 1 meter 16 millimeters.

To find the number of threads per centimeter:

$25.4 : 10 \text{ as } 48 : x$, and $x = 18.9$ threads per centimeter.

To find the length of sheeting weighing 1 kilogram:

1 kilogram = 2.2046 pounds and 2.35 yards of sheeting weigh 1 pound,

then $2.2046 \times 2.35 = 5.1807$ yards in 1 kilogram.

Since 1 yard = 914.4 millimeters and 1 meter = 1.0936 yards,

$5.1807 \text{ yards} = 5.1807 \times 914.4 = 4 \text{ meters } 737 \text{ millimeters.}$

Therefore, a piece of sheeting 4 meters 737 centimeters long weighs 1 kilogram.

If 1 yard costs 36 cents, then:

1 meter cost = $1.0936 \times 36 = 39.25 = 39\frac{1}{2}$ cents.

The quotation now will read:

Sheetings, 1 meter 16 millimeters:

18.9×18.9 , 4 meters 737 millimeters.....meter \$0.39½

(C) Tire building fabrics:

17½ ounce, Sakellarides, combed.....pound \$2.90

This means that 1 square yard of this fabric weighs 17½ ounces and that it is sold by the pound.

To convert this into metric figures:

1 square yard = 0.836 square meter and 1 square meter = 1.196 square yards.

1 pound = 16 ounces = 0.4536 kilogram or 453.6 grams, therefore 1 ounce = 28.35 grams.

$17\frac{1}{2}$ ounces = 480 grams = weight of 1 square yard.

Therefore 1 square meter weighs:

$1.196 \times 489 = 584.84$ grams, say 585 grams.

If 1 pound costs \$2.90, then

1 kilogram costs = $2.90 \times 2.2046 = \$6.39\frac{1}{2}$.

The quotation now reads:

Tire building fabrics:

585 grams, Sakellarides, combed.....kilogram \$6.3½

RECEIVING AND SHIPPING: As the railroads cannot afford to scrap their present freight car equipment to build new cars to even metric dimensions and capacities, and as the cars will have to be marked in that respect in metric figures, both the receiving and the shipping clerk will be confronted with strange figures. A standard railroad car 36 feet 6 inches long, capacity 40,000 pounds will be marked 11 meters 125 millimeters, capacity 18,144 kilograms. Where the freight classification list designates 18,000 pounds as the minimum load for this car, the figure will be 8,163 kilograms. Freight rates will be given per 100 kilograms.

ACCOUNTING AND STATISTICS. In all rubber factories a careful record is kept of the use of the various compounds and the goods made from them. Quotations, records, costs, bonuses, sliding scales, etc., being based on meter, kilogram and liter will all be affected and the accounting force as well as the statistical department will have to reckon with new conditions.

MANUFACTURED RUBBER GOODS.

Standardization is one of the mainstays of American industrial development. It makes possible mass production, cuts down costs and creates uniformity. To say that an article is standard implies desirability. To upset and throw down these standards is to use the axe on the roots of our industrial well-being. And this is precisely what the metric system would do.

In looking over the field of finished goods the list is so extensive that only a few can be mentioned here.

PNEUMATIC TIRES. Tire manufacture has been well standardized. To change to metric figures means not only obliterating present inch markings and the reengraving of molds to metric designations, but also the changing of over-all dimensions. A tire 104 by 914 millimeters would hardly be recognized as a 4½ by 36-inch. The making of new stock lists, price lists and labels follows as a consequence.

BELTING. Rubber belting is standardized as to width on the inch basis and made as to thickness from 2-ply up. The working load of a belt is a certain percentage of its breaking load in pounds per inch width. From this the engineer figures the belt width required for the horse power (English h.p. = 33,000 foot pounds per minute) needed at a given belt speed in feet per minute.

HOSE. Rubber hose is standardized as to its internal diameter in inches, listed per foot of length and rated to pressure in pounds per square inch. An example:

Pneumatic Tool Hose.	English.	Metric.
Internal diameter	½-inch	12.7-millimeters.
Working pressure (double fabric)	175 pounds per square inch,	
	12,304 kilograms per square centimeter.	
List price	\$0.47 per foot	\$1.54 per meter

MATS, MATTING AND TILING. These are made to standard dimensions and priced per square foot or piece. Corrugated rubber matting, for instance, is carried in stock widths of 24, 30, 36 and 48 inches; the weights are as follows:

English.
Weights per square yard.
3/32-inch thick 5 pounds
¼-inch thick 7 pounds
5/32-inch thick 10½ pounds

Metric.

Weights per square meter.
2.381 millimeters thick 2.712 kilograms
3.175 millimeters thick 3.975 kilograms
3.969 millimeters thick 5.696 kilograms

DRUGGISTS' SUNDRIES. The list of druggists' sundries and hospital supplies is a long one indeed and includes atomizer bulb's, camera bulbs, syringe bulbs, elastic bands, elastic cords, hard rubber combs, hard rubber funnels, medicine droppers,

nipples, nipple shields, rattles, rubber thread, teething rings, tobacco pouches, syringes and water bottles.

Considering the last-named article, water bottles are standard 2 and 3-quart size.

2 quarts = 1.892 liters.

3 quarts = 2.838 liters.

To sell these articles by metric designations would be confusing to both the dealer and the customer. Therefore the retail trade would demand these goods in even figures. The nearest figures would be 1¼ and 2½ liters (7½ per cent small), or 2 and 3 liters (5.8 per cent large). It will be noticed that in the first case binary fractions are here applied to the decimal metric system, an anomaly to the metric faddist. Is it better to standardize the smaller or larger sizes, or should the dealer carry four sizes in stock where formerly he carried only two? In either case the habit of the buying public must be changed and as an additional burden the manufacturer will have to discard his molds and make new ones.

SPECIFICATIONS AND CATALOGS.—The requirements on some rubber goods are very exacting; as a case in point, the rubber insulation for electric wires. Specifications to cover them will have to be rewritten to metric figures and changed in many cases to avoid too extended metric decimal fractions which would not be practical to work to in the factory.

Goods must be advertised. This means new catalogs, after new standards have been settled on, and prices will have to be recalculated to suit them.

Goods must be properly boxed for shipment and attractive presentation to the trade. This means different size boxes to accommodate articles changed to rounded metric figures. This in turn requires new labels, change in billing, etc. Many goods are now packed and sold in dozens and gross. The metric law may compel us to sell them in 10's and 100's.

THE RUBBER INDUSTRY.

To gain a conception of what it would mean to change from a well grounded system of measurements to a system which has, aside from some theoretical considerations, little to recommend it, one must realize the extent of the industry which is asked to take this step. Crude rubber consumption may be taken as a fair indication of the importance of this industry.

	World Consumption. Tons.	United States and Canada. Tons.	United States and Canada. Per Cent.
1917	209,500	155,000	74
1918	210,000	187,000	89
1919	298,000	230,000	77

Furthermore, statistics show that the production of finished rubber goods in the United States was:

1914	\$ 300,994,000
1919	1,200,000,000

Still another angle is obtained from the following:

VALUE OF UNITED STATES TIRE EXPORTS.	
1913	\$ 3,943,220
1914	3,505,267
1915	4,963,270
1916	17,936,227
1917	12,330,201
1918	13,977,671
1919	22,466,580

Viewed from the three angles given it is evident that the rubber industry of the United States is preeminent in the world to-day. These are facts, not fancies; definite statements, not generalizations. This industry is young, vigorous and full of promise for still greater achievements in the future. Shall it be hampered by throwing the "metric monkey wrench" into its machinery?

CLAIMS TO JUSTIFY DEMANDS FOR COMPULSORY USE OF METRIC SYSTEM.

Many claims are presented and urged for the compulsory use of this system. Some are so beside the facts that to consider them would be wasting space and time. The principal arguments are given and answered below.

SIMPLICITY CLAIMED FOR METRIC SYSTEM.—The claim is made that the metric system is very simple. Admitting its structural simplicity, it lacks those most important qualities of the English system, handiness and convenience, qualities which no academic perfection can replace.

This is conclusively shown by the fact that, although the metric system has been legal in the United States since 1866, little progress has been made toward its general use in the industries. Had it possessed the qualities mentioned it would have long ago crowded out the English system, which, imperfect as it is, has successfully held its own, and has enabled the United States to become a leader in industrial pursuits.

SUPPOSED NEED FOR WORLD TRADE.—The claim is made that this system is needed for world trade, that without it American markets cannot be extended to foreign countries.

In this connection the metric advocates have made much of the fact that when America first began the export of automobiles some cars were equipped with metric tires. Now all this has been changed. A prominent motor car company in a letter says: "Most South American countries take inch sizes with the exception of Chile," while another manufacturer says: "We furnish standard American tires on all our cars."

The American automobile industry standardized the tread of automobiles to 56 inches (4 feet 8 inches, practically railroad gage, which is 4 feet 8½ inches) against the wishes of users in the South, who, on the claim that southern roads were poor, asked for a 60-inch tread. In the Argentine the Americans came in competition with Italy which was furnishing any tread desired. In spite of this the Americans stuck to their standard and now Italy has fallen into line. The standard automobile tread the world over is 56 inches = 1 meter 422 millimeters.

CLAIMED WON THE WAR FOR ALLIES.—The claim is made that the Allies won the war on account of their standardizing to the metric system. All that need be said is that if the metric system has won the war for France, then the metric system has also lost the war for Germany.

SUPPOSED UNIVERSAL DEMAND.—The claim is made that between 90 and 99 per cent of the people of the United States want the metric system, therefore its use should be made compulsory.

In refutation of this assertion only a few facts need be recorded here, such as the following. In January, 1920, the Pittsburgh Chamber of Commerce, Robert Garland, chairman, representing a district which, according to statistics, produced in 1918 manufactured articles to the value of \$2,305,000,000, passed resolutions condemning legislation in favor of the metric system.

At a meeting held in Chicago, March 16, 1920, the American Railway Engineering Association in convention assembled, passed resolutions against the adoption of this system. Other associations, at various dates and places, did the same.

CONCLUSION.

The space allotted is exhausted and yet the writer has touched only the high spots and these in only a fragmentary way. A great deal more could be said and from many other angles. It is obvious that the writer does not favor the use of this system being made compulsory. If it possesses the advantages claimed for it by its advocates it will prove them, its use being permitted by law. If it cannot win on its own merits by voluntary adoption under the protection of this law, it is not entitled to win under a law of force.

RUBBER BALLS BRAND WALNUTS.

STILL another instance of the infinite variety of uses to which rubber can be put is afforded by a newly-invented machine which is being tried by the California Walnut Growers' Association, and which is the device of Ansel L. Wysoong of Los Angeles. It was selected from among thousands of other contrivances sub-

WALNUTS BRANDED BY MEANS OF RUBBER BALLS.

mitted by contestants for the \$10,000 prize offered by the Association, which markets nearly fifty million pounds of walnuts annually and which last year did a business of over \$14,000,000.

The essential feature of the machine is a steel cylinder in the surface of which is engraved a series of intaglio branding dies. This cylinder rotates in a bath of quick-drying ink and is en-

WALNUT BRANDING MACHINE.

gaged with a second cylinder of the same size which carries firmly, in pockets in its surface, soft rubber balls. These balls are so placed that each comes into direct pressure contact with its corresponding engraving on the steel cylinder, receives the impression of the trademark, and transfers it to the shell of the walnut after a further quarter-revolution. An ingenious hopper-conveyor arrangement insures the positive engagement of each walnut with the printing balls, which, being soft and resilient, impress the brand into the tiny cracks and over the sharpest ridges of the shells. Water is run through the steel cylinder to prevent the overheating of the rubber balls through friction.

Besides being used for walnuts, it is likely that the machine may be licensed for branding oranges, lemons and other fruit.

Rubber Creations for Moving Pictures.

THAT several hundred moving picture companies with large plants and millions invested should use much rubber of the every-day sort is axiomatic. But that the cinema industry should demand an absolutely new line of products comes as a surprise. Yet such is the case, and so great has the demand become that a rubber factory has been built which specializes in this novel line.

HUGE RUBBER SHARKS AND SEA MONSTERS.

When a breathless audience sees a deep-sea diver kill a hungry shark they do not guess that the fish was created in a rubber factory. The shark is actually an air-inflated affair, built of rubber stretched over a light metal frame, with a double underside, suitably painted, having a hinged jaw, and operated by wires a few feet under the water.

When an enormous octopus encloses a man in his terrible tentacles to carry him to certain death, the creature, like the shark, is also made of sheet rubber. From the shore a man with a compressor pumps air through hundreds of feet of rubber hose, inflating the octopus and insuring the slow-encircling movement of the tentacles. Ample sunlight, remarkably clear water, a rocky coast and a deep-sea camera are the other essentials.

Whales and antediluvian monsters are also built up over light frames, the calendered stock being compounded for the dry heat cure. Seams are doubly reinforced and stays are put in wherever there is any likelihood of extra strain. Only a low air pressure is practicable in the larger creations as the air force is so great that a very little extra pressure will burst the huge air bag.

RUBBER SWORDFISH FOR COMEDY WORK.

A world-famous comedian ordered a big swordfish, with its serrated snout set upright instead of sideways. This was accomplished. Soon the comedian was being pursued through a water-filled tank by the rubber fish, receiving vicious thrusts from its

maces for breaking armor had rubber-covered cork ball tops, rubber spikes being vulcanized to the balls. The realistic swords were rubber, painted steel color. The daggers were thin metal blades with two-inch soft rubber points.

DRIVING AN ARGUMENT HOME.

CAPTIVE SURF-SWIMMING SHARK.

sword. Of the same type of creation are the big surf fishes, every fish when inflated being capable of carrying three mermen or mermaids.

RUBBER SPEARS, BATTLE AXES AND BLUDGEONS.

A great battle scene in the Middle Ages required a big supply of war material. The battle axes were made with light sheet metal centers, rubber-covered and with deep rubber edges. The

For an ancient Mexican scene the Aztec Army was armed with huge clubs, each club head representing a skull or dried head of an enemy. This was done in rubber, the sketches for the molds being supplied by research artists in a famous studio. The same sort of creation, although pneumatic, is used in the huge hammers which "drive an argument home."

The spear heads are a line of manufacture in a class by themselves. They are made of a fairly high grade compound that is dense enough to appear rigid and yet as soft as velvet to the touch. They are cured in two-part molds with an iron socket, into which the spear shaft is set. If the spears are likely to see much service the iron is first cleansed from all trace of grease and dipped in copper solution. When the cure is effected the sulphur in the rubber unites chemically with the copper and the rubber is stuck so tightly that it cannot be loosened except by cutting with a cold chisel.

Halberd heads are cut out of sheet stock, following a paste board pattern, and cured between metal plates in a steam press. The cutting edge and the points are skived down after curing and the whole given a final coat of steel colored paint to more closely simulate metal.

RUBBER AND A BURSTING BOILER.

A very exciting scene is provided when movie villains tie their victim to an upright steam boiler, then rouse the furnace to its utmost fury, and leave the poor fellow to be blown to atoms. But it only seems to happen. The boiler is of rubber, its rivets tiny rubber half-balls cemented to its side; the steam gauge is an exaggerated air gauge and before the boiler explodes a straw dummy has been substituted for the writhing victim. The effect is heightened by the air pressure gradually distending the boiler

sides until the rivets begin to fall off. A blinding cloud of steam, released from a pipe nearby at the critical moment, gives the final touch of realism.

A movie director who had much trouble in getting real bovines to yield milk when, where, and in any quantity wanted, commissioned the company to produce for a wooden cow he was having built a huge udder of rubber. The result was the most docile bossy imaginable, which broke all records as a milker.

Another order was for an air-cushioned bag into which a man could be fastened and then thrown off the roof of a sky-scraper to bounce about in the street below. Up to date this order had not been filled.

A harrow turned upside down is a murderous looking affair, especially when an I. W. W. hurls an honest farmer upon it. With teeth of rubber, however, one falls very comfortably and the movie rubber factory makes such teeth.

Every fresh demand for bird, beast, reptile or appliance entails special problems and often original tools and appliances. A considerable degree of general knowledge and engineering skill are required, but above all adaptability and inventive faculty are prime requisites. For example, in building a huge rubber shark weight distribution must be studied so that the completed creature will float, not only right side up but on an even keel. There is also the difficulty of holding air in the hollow carcass once it is submerged, as a very slight extra pressure will force the air out and bring about a collapse.

Take it all in all, the business, although fascinating and specialized in the highest degree, is not one that every one could engage in successfully. It is, however, another triumph for rubber and has made many hazardous and impossible scenes safe and successful.

NEW EFFECT IN RUBBER-IZED RAIMENT.

A novelty in dress, of interest, is a black cambrie, glossy, rubberized cloth, garment in which Miss Bebe Daniels, Famous Players-Lasky motion picture star, recently appeared. The gown is modishly designed and it made a particular hit in the studio, where it photographed with even more luster than satin. The material, which has already been tried to some extent on women's hats, is much thinner, lighter, and more pliant than the finest quality cloth, and, as might be inferred, it is impermeable to moisture.

A SCREEN STAR DRESSED IN RUBBER.

FIRST FEDERAL FOREIGN BANKING ASSOCIATION.

In passing the Edge Bill, Congress has provided machinery, in the form of international banks under Federal charter and under the direct supervision of the Federal Reserve Board, for the financing of this country's export trade. The great depreciation of European currencies in international exchange has erected a barrier against the export trade of the United States. Manufacturers who have built up substan-

tial markets for their products, particularly in Europe, through years of effort, are finding it increasingly more difficult to continue the sale of their goods. European purchasers of our products are unwilling to settle at existing rates of exchange, but in many cases are willing to continue to do business on the basis of credit in the belief that as the work of rehabilitation progresses production will increase, and that within a reasonable time exchange will show a favorable improvement.

Up to the present time, however, the American manufacturer has had no banking facilities enabling him to meet this situation, or permitting him to compete in foreign markets on a credit basis.

The Edge Bill is so drawn as to permit the association of banks and manufacturers in the organization of foreign banking corporations, and in the organization of the First Federal Foreign Banking Association this plan has been followed.

A group of banks selected in New York, Boston, Philadelphia, Buffalo, Bridgeport, Worcester and Springfield, Massachusetts, have underwritten the capital stock for the benefit of manufacturers, in their localities, who are interested in foreign trade. The stockholders of the new bank will, therefore, be manufacturers and banks. The manufacturers, in contributing their business to the bank, will share in the profits of such business. The banks will act as the distributing centers for acceptances, guaranteed paper and other obligations issued by the bank. The new bank, therefore, has the features of a mutual company through which the manufacturers who are stockholders will obtain capital, for financing their foreign business, from the investors of the country, and in furnishing business to the bank will participate in the profits of it. A line of discount on foreign paper bearing some proportion to the capital invested will be granted to manufacturers who are stockholders. In effect, therefore, the proposed plan of organization contemplates that manufacturers interested in foreign trade shall, through their stock ownership, provide a margin in the shape of capital which will furnish an additional security for the obligations to be issued to the public.

The initial capital of the bank will be \$2,100,000, evidenced by 20,000 shares of a par value of \$100 per share, and 1,000 founders' or managers' participation shares of the same par value. These latter shares are to be entitled to receive 15 per cent of the net earnings, and can be held only by the founders, directors and officers of the company. The purpose of these shares is to enable the organization to secure men of exceptional talent and experience for the work of managing this enterprise, and to obtain the close cooperation of important agencies abroad. The stock of the First Federal Foreign Banking Association, including the founders' or managers' shares, has all been underwritten at \$105.

SHIP BY TRUCK—GOOD ROADS WEEK.

National Ship by Truck-Good Roads Week, to be observed May 17 to 22, inclusive, is being planned throughout the country. Tentative plans include motor truck tours covering virtually every section of the country, giving practical demonstrations of the utility of truck transportation and preaching the doctrine of better highways.

Other plans include essays by school children, sermons and the distribution of literature, all designed to arouse interest in a national program of highway construction along lines already advocated by such organizations as the American Automobile Chamber of Commerce, the National Grange, the United States Chamber of Commerce, the National Automobile Chamber of Commerce, the National Association of Motor Truck Sales Managers, and the Ship by Truck Bureau.

Public officials everywhere heartily approve the general idea involved in ship by truck week.

Stabilizing Southwest Cotton Industry.

COTTON-GROWING is assuming such large proportions in the Southwest, and so many are the problems to be solved in connection with the expanding industry, that leading growers and dealers in this essential commodity of automobile tire manufacture have formed the Pacific Cotton Exchange in Los Angeles, California, which will also make the latter city the chief distributing point for the product of the plantations of California and Arizona. The establishment of the exchange is expected to give the raising of Pima or long-staple cotton a great impetus in the states named, and incidentally yield considerable service to the rapidly growing rubber industry in southern California, which was beginning to feel keenly the need of such a "balance wheel" for the new cotton trade.

One of the chief objects of the exchange, as set forth by its president, Thomas W. McDevitt, to a representative of

THE INDIA RUBBER WORLD, is to stabilize prices. There is no "future" market for long Pima, as production and grades have been uncertain, and standards of quality must be established, as well as fair prices be insured to producer and consumer. Owing to the great demand that has sprung up, and as large sums will be loaned to handle and market the cotton, the new exchange also purposes seeking state legislation to safeguard the large amounts that will be advanced to aid the industry. As cotton is a cash crop, definite rules must be set up for making loans on commercial paper, warehouse receipts and bills of lading, as well as for insuring against losses of various kinds. Means will also be devised for protecting crops against insect ravages.

The new exchange has temporary quarters in the I. W. Hellman Building, and its sessions start at 6 a. m. daily to conform to the hour of opening of the New York Cotton Exchange—9 a. m. Eastern time. The other officers chosen, besides Mr. McDevitt, are: M. P. Scott of McFadden Bros., vice-president; K. M. Turner, treasurer; C. H. Hartke, attorney; Board of Directors, Messrs. McDevitt, Scott, Turner, Hartke, and E. M. Fowler of the E. M. Fowler Co.

Mr. McDevitt says that in California and Arizona, 200,000 acres are now producing cotton. They should yield 100,000 bales or, at an average of 500 pounds to the bale, a total of 50,000,000 pounds this year. The Goodyear, Fisk, Firestone, and other tire concerns, which are financing many growers, as well as raising a great amount of cotton themselves, guarantee a price of 60 cents a pound with growers' option on the market beyond that price within a year. At this price the total value of the southwest cotton yield this year will be at least \$30,000,000, not counting the seed, which will be worth about \$5,000,000 more.

The average cost of putting the cotton in bales is 22 cents a pound and some has been sold recently at \$1.24. In 1916 when the Goodyear Tire & Rubber Co. took over 7,000 acres for planting in the Salt River Valley, Arizona, at the instance of Mr. McDevitt, cotton was selling at 52 cents a pound. He ventured the prophecy that in three years it would sell for 75 cents and that the total southwest cotton area would

reach 175,000 acres. Both figures have been far eclipsed. The value of Arizona cotton in 1914 was \$2,000,000; in 1919 it reached \$45,000,000. At the present rate of growth it is expected to total \$100,000,000 in 1922.

Land values have shared in the southwest cotton boom, too. Choice acreage that could be had three years ago for \$125 now brings \$500, and land renting for \$10 an acre in 1916 easily rents for \$60. This soil is irrigated with water from the Colorado River, which has in a large measure come to be in the Southwest what the Nile is in Egypt, where land sells from \$600 to \$800 and yet yields a large return on the investment. Plans are now being considered for a wide extension of the fertile area through desert irrigation by means of new canals in California and Arizona from the Colorado river.

The president of the new exchange is very optimistic, not

only about cotton-growing, but also about the rubber industry in the Southwest. He says that cotton raised there can meet plantation rubber in Los Angeles and, after being fabricated into tires, can be taken through the Panama Canal to New York and there compete with any similar products of Akron. All of this he promises in the very near future.

THOMAS W. McDEVITT.

TO ORGANIZE INTERNATIONAL CHAMBER OF COMMERCE.

The new International Chamber of Commerce, projected at the International Trade Conference at Atlantic City, New Jersey, last October, will be formally organized at Paris during the week of June 21, 1920. Invitations have been sent out by the American group of the International Organization Committee to business and industrial associations, asking them to name delegates to participate in the organization meeting. About 100 American delegates are expected to attend.

The International Organization Committee is to meet at Paris in advance of the general organization meeting to prepare and report a plan of permanent organization.

In view of the disturbed conditions in international trade brought about by the exchange situation, this meeting is expected to assume additional importance. The vital question of international credit, as well as shipping, tariff regulations, unfair competition in international trade, and other problems of equal moment affecting stability in international trade and production in all the principal countries in the world, will be discussed.

The International Chamber succeeds the old International Congress of Chambers of Commerce, which ceased to function with the outbreak of the World War in 1914.

Membership is to consist of chambers of commerce, commercial organizations, banking and similar associations, firms, corporations and individuals, holding associate but not voting membership. Meetings of the membership will be held every two years, and a system of referenda will be inaugurated during the interval between the bi-annual meetings.

At the first meeting in June only the five countries participating in the International Trade Conference—the United States, Belgium, Great Britain, France and Italy—will be represented. Later, business organizations in the other principal countries of the world will be taken into membership.

Prices of Cotton and Cotton Products.¹

WAR INDUSTRIES BOARD.—Bulletin No. 23 dealing with the prices of cotton and cotton goods, is one of 50 inquiries into wartime prices in different industries. The aim of these studies is to make the price quotations, gathered by various government agencies, available to men interested in problems of business readjustment and also to provide a permanent record of the great revolution in prices during the six years ending in 1918.

To throw as much light as possible upon the course of price fluctuations, this bulletin begins with a brief account of conditions prevailing in the cotton industry. Data regarding production, imports, exports, stocks, government purchases, and government control are woven into the account, and the factors that exercised special influence upon markets are emphasized.

The price charts scattered through the bulletin are drawn on a uniform scale. Since the inquiry centers in the effect of the war, the charts are made to show the movement of prices away from the pre-war level. This effect is produced by considering the average of the actual prices during the 12 months preceding the outbreak of war (July 1, 1913, to June 30, 1914) as equal to 100 and reducing the actual prices for each month from January, 1913, to December, 1918, to the form of relative prices with the prewar average as base. For example, if the selling price of a commodity averaged \$2 a pound in

RELATIVE PRICES.—Cotton to Producers in United States, and Weighted Index Numbers of prices of Cotton Yarns and Cotton Manufactures.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914 = 100.)

WEIGHTED INDEX NUMBERS OF WHOLESALE PRICES.—Cotton Class and "All Commodities".—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914 = 100.)

RELATIVE PRICES.—Short Staple Cotton, Upland Middling, New York; Long Staple Cotton, average of four sources; Sea Island Cotton, Extra choice Savannah. By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914 = 100.)

the 12 months before the war, and if it fell to \$1.80 in October, 1914, the relative price in that month would be 90; if the price rose to \$4.60 in July, 1918, the relative price would be 230. On this plan, the price charts are comparable one with another.

For those who wish to know not only the fluctuations of particular prices but also the general trend of prices in different industries, "index numbers" are provided. A simple average of the prices of commodities sold—some by the dozen and some by the ton, some by the yard and some by the bale—would obviously have little value. Therefore, in making index numbers each commodity is "weighted" by multiplying the monthly prices for 1913 to 1918 by the amount of the commodity produced in 1917, plus imports. Nineteen hundred and seventeen was selected as the weighting year because the tables are intended to reflect wartime conditions, and because data for 1918 were unobtainable for many commodities when the bulletins were being written.

An enumeration of the successive steps in making these index numbers will show their meaning. First, for every commodity included in the computation there was made an estimate of the quantity produced in the United States in 1917 plus the quantity imported. Second, the price of the commodity in each month in the six-year period covered was multiplied by the "weight." Third, the products of the different commodity prices times their weights

CHANGES IN WEIGHTED INDEX NUMBERS.—Prices.—Cotton, Cotton Yarns and Cotton Manufactures compared with Index Number of "All Commodities".

¹Abstracted from War Industries Board Bulletin No. 23, "Prices of Cotton and Cotton Products," by James Harvey Rivers, assisted by G. M. Fairchild and Florence Dickinson.

a On middling. b Off middling. c New York to March, 1915. Average of 11 markets designated by Department of Agriculture, March, 1915, to December, 1918, inclusive. d New York price. e New Orleans price. f Government action taken on December 24, 1914, altered somewhat the standards of grading, but contracts made on the old basis were permissible to February 17, 1915. This probably explains many abrupt changes in prices. g Beginning September, 1917, market, f. o. b. Alexandria, Egypt. A Not weighted according to quantities marketed each month. i Interpolated.

were added up separately for each month. Finally, the monthly aggregates were turned into relatives on the prewar base; that is, the average aggregates of July, 1913, to June, 1914, were made equal to 100, and all the monthly aggregates were made over on that scale.

It is evident that the index numbers made on this plan for an industry are strictly comparable to the relative prices for particular commodities shown in the charts. By the use of these indexes a clear idea can be obtained of average price fluctuations in a given branch of business, and fluctuations in one industry can be compared with those in others.

DETAILED STUDY OF PRICE MOVEMENTS.

In any study covering a period of rapidly changing price levels, the significance of price movements of individual commodities or classes of commodities is fully brought out neither by absolute increases nor by increases relative to prices prevailing in some representative year chosen as a base. In fact, both of these methods are inadequate for depicting commodity price movements, unless some direct comparison can be made at all times with the movement of the price level itself. To represent price changes without such a comparison is much like measuring the height of waves on a lake where the level is continually changing, not only without having any regard for the differences in level but using at the same time a continually varying yardstick as a unit of measure. Hence the first com-

WEIGHTED INDEX NUMBERS OF WHOLESALE PRICES.—Long Staple Cotton, average of 4 series: Long Staple Cotton Yarns, average of 7 series; and Long Staple Cotton Manufactures (except yarns), average of 13 series.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914=100.)

parison is that between the general price level of all commodities and the cotton-class level.

For many purposes it would be advantageous to represent the general price level by 100 at all times and to reduce all

RELATIVE PRICES.—Sea Island Cotton, extra choice, Savannah; Sea Island Weaving Yarn, single combed, 80s; and Cotton Tire Fabrics, 17 1/2 oz., combed.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914=100.)

other prices to percentages of that base. This method of presentation will be applied later to cotton, cotton yards, and cotton goods, but as such a method of comparison is not in general use, the ordinary mode of representation has been adopted in the accompanying chart.

COMPARISON OF THE PRICE MOVEMENTS OF THE COTTON CLASS AND OF "ALL COMMODITIES."

It may be noted:

(1) That, as was expected, the minor fluctuations of the Cotton Class were more frequent and more pronounced than those of the general price level.

(2) That the low prices of cotton and cotton goods prevailing from July, 1914, to July, 1916, had no counterpart in the general price level, and were consequently a result of forces acting on the Cotton Class as such and not of those affecting the price level in general.

(3) That the rise in prices of the Cotton Class, which started in 1915, began earlier, proceeded faster, had more frequent and more extensive reactions, and finally continued further than that of prices in general.

COMPARISON OF THE PRICE MOVEMENTS OF COTTON, COTTON YARDS, AND COTTON MANUFACTURES.

It is found:

(1) That the fluctuations were most pronounced for cotton and least pronounced for cotton goods.

RELATIVE PRICES.—Cotton: Upland Middling, New York, and Upland Middling, Liverpool.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914=100.)

WEIGHTED INDEX NUMBERS OF WHOLESALE PRICES.—Short Staple Cotton, Upland Middling, New York; Short Staple Cotton Yarns, average of 5 series; and Short Staple Cotton Manufactures, foreign yarns, average of 19 series.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914=100.)

(2) That price fluctuations occurred most often in the following order: First in cotton, second in yarns, and last in fabrics; but that no general rule as to sequence was followed.

(3) That the great fall in the prices of cotton in the spring of 1918 had no counterpart in the prices of yarns and fabrics. This decline in cotton prices was probably due to the unfavorable military situation which brought with it the threat to shipping and to the prospect of price-fixing. These forces naturally did not have a similar effect on the prices of yarns and fabrics.

(4) That the fall in prices in the early part of the period was greatest for cotton, less for yarns, and least for fabrics, while the rise in prices for the latter part of the period was least for cotton, more for yarns, and greatest for fabrics.

In order to bring out more clearly the relative positions of the raw, intermediate, and finished products and to get a basis for quantitative comparison, the cotton curve, the cotton yarn curve, and the cotton manufactures curve will each be divided (ordinate for ordinate) by the general price curve. The quotients thus derived will represent the rise in prices of each of these classes of products in terms of an all-commodity standard of value.

The fourth chart of page 489 shows:

For cotton.—(1) That the drop in prices in 1914 below the general level was

RELATIVE PRICES—Drilling, 30 inch, 70 x 48, 2.85 yards per pound.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914=100.)

RELATIVE PRICES—Tire Fabric, Sea Island, 17 1/2 ounce, combed.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914=100.)

greater than the rise above that level in 1918.

(2) That the period for which prices were substantially under the general level was somewhat longer than that for which they have been above.

(3) That assuming a uniform distribu-

RELATIVE PRICES—Cotton Waste, average of three series; and Osmaburg, 30 inch, 40 x 32, 2 ounce, 60 per cent waste.—By months, January, 1913, to December, 1918. (Average quoted prices, July, 1913, to June, 1914=100.)

tion of sales by the producers, the net loss resulting from the low prices in the earlier period was greater than the net gain in the later period.

(4) That since the lowest price (below the general level) came in the fall of 1914 and the early spring of 1915, the months when the bulk of the crop was being sold, the balance of loss over gain is larger than appears from a cursory glance at the chart.

For cotton yarns.—(1) That the decrease in prices in 1914 compared with the general level was much less than the rise above that level in 1918.

(2) That the period for which prices were under the general level was substantially equal to that for which they were above.

For cotton manufactures.—(1) That the fall in prices in 1914 below the general level was slight compared to the rise above that level in 1918.

(2) That as was the case for yarns, the period for which prices were under the general level was substantially equal to that for which they were above.

COMPARISON OF THE PRICE MOVEMENTS OF RAW MATERIALS.

SHORT STAPLE, LONG STAPLE, SEA ISLAND.—It should be noted—

(1) That the price movements of short-staple and long-staple cotton were very similar throughout the period, with, however, more pronounced fluctuations in the former. This tendency is probably to be explained by the greater sensitiveness of a

market dominated by transactions on a central exchange.

(2) That the price fluctuations of sea-land cotton were similar to those of the other cottons for the early part of the period, but that prices began to rise faster and farther after the end of 1914, probably as a result of the difficulty of importing Egyptian Sakellarides, almost a perfect substitute, and the great war demand for the longest staple cottons for use in manufacturing automobile tires, balloon cloth, and other fabrics of great strength.

UPLAND MIDDLING COTTON, AT NEW YORK AND LIVERPOOL. It should be noted—

(1) That the fluctuations were entirely similar until the latter part of 1914, when the fall in price at New York exceeded that at Liverpool, probably as a result of adverse exchange rates and anticipated shortage of ocean transportation.

(2) That beginning in the fall of 1915, the differences in prices gradually increased. This increase can probably be largely explained by high freight and insurance rates and difficulties in shipping.

COMPARISON OF THE MOVEMENT OF PRICES OF RAW MATERIALS WITH THOSE OF INTERMEDIATE AND FINISHED PRODUCTS.

SHORT-STAPLE COTTON, YARNS, AND MANUFACTURES. It should be noted—

(1) That the fluctuations were the most pronounced for cotton, and the least pronounced for cotton goods.

(2) That in 1914 the fall in prices was greatest for cotton and least for fabrics; while in 1918, the rise in prices was greatest for yarn and least for cotton.

(3) That no rule can be laid down as to the order in which the fluctuations occurred, but that in general the change in price whether rise or fall occurred first with the raw material and later with the intermediate and finished products.

LONG-STAPLE COTTON, YARNS, AND MANUFACTURE. From chart, page 491, it is seen:

(1) That the fluctuations were the most pronounced for the raw material and least pronounced for the finished product.

(2) That in 1914, the fall in price was greatest for cotton and least for fabrics, while in 1918, the rise in price was greatest for yarn and least for cotton.

(3) That in general fluctuations occurred first in the cotton, next in the yarns, and finally in the fabrics—but that this sequence was not invariable.

SEA ISLAND COTTON, YARNS, AND MANUFACTURES. It is seen:

(1) That unlike the two cases just discussed, the rise was higher for the cotton than for the finished fabric, and for the finished fabric in turn than for the yarn.

(2) That no rule can be established as to the order in which fluctuations occurred.

COTTON WASTE AND OSNABURG. From the chart, page 493, it is seen:

(1) That the price movements for the raw and finished products were very similar.

(2) That the fluctuations in the prices of cotton waste were more pronounced than were those of osnaburg.

(3) That in practically every case the fluctuation occurred first in the price of the raw material.

PRICE TABLES.

The price quotations contained in the accompanying tables have been secured from the Bureau of Labor Statistics, financial papers, trade journals, and private firms. In each case an attempt has been made to select not only the most reliable source but also the most representative market. For example: for short-staple cotton, Liverpool, New York, and New Orleans were chosen as markets; while for Sea Island, Savannah was chosen; and for long-staple varieties, New Bedford. Also each article, for which a series of price quotations has been carried, was selected to represent the price movement in the class to which it belongs.

The prices of cotton are monthly averages of weekly quotations; prices of all other commodities were taken but once a month, and, with few exceptions, represent the market during the first week of the month.

Cotton in British Africa.

THE ELIMINATION of Germany from Africa leaves England free to develop the resources of the continent, particularly in the southern, central and eastern portions, without fear of interference. It leaves her free, for instance, to continue and strengthen the effort to free herself from dependence on the United States for cotton, which started the cultivation of that staple in Nyasaland at the beginning of the century.

An optimistic report on the present condition and on the prospects of cotton cultivation in that country, recalls the marvellous story of the growth of rubber culture in England's African possessions. European cultivation began in 1903 and soon after the high prices of cotton led the Lancashire mill owners to try to do without American cotton and to encourage its growth elsewhere. The British Cotton Growers' Association was formed and took Nyasaland with other districts under its wing. The record of exportation since is:

	Pounds.	Value.		Pounds.	Value.
1902	962		1910	1,736,999	£58,687
1903	56,897	£1,778	1911	1,359,904	44,199
1904	285,185	5,941	1912	3,237,555	80,939
1905	776,640	16,180	1913	2,401,142	65,486
1906	526,119	15,345	1914	2,648,508	72,068
1907	403,486	13,998	1915	3,065,248	68,586
1908	756,120	28,335	1916	3,462,478	127,131
1909	858,926	26,209			

The cotton grown is known as Nyasaland upland and comes from a long-stapled American variety. The seed was originally imported by the Zambesi Industrial Mission; it was acclimated and selected as the kind to grow after long experimentation with Egyptian, Sea Island, Indian, Brazilian, American upland and other varieties. At first they raised Egyptian on land of less than 2,000 feet elevation and Nyasaland up to 3,000 feet; now Egyptian has been wholly discarded and only Nyasaland from carefully selected seed is raised.

The number of acres now under cultivation and the estimated possible area are:

	Under Cultivation, Acres.	Possible Extension, Acres.
Shiré Valley	13,450	218,000
Shiré Highlands	19,000	291,000
Lake Nyass	400	800,000
	32,850	1,309,000

The natives take easily to cotton raising. There is a fair amount of native labor for the European plantations and many

(A. Livingston Bruce.)

A NYASALAND COTTON ESTATE. PICKERS BRINGING IN COTTON.

are beginning to raise cotton independently, but the planters count on modern machinery for the development and above all need improved transportation within the colony.

What the Rubber Chemists Are Doing.

EXTRACTION OF RUBBER GOODS.¹

IN RUBBER ANALYSIS, where rubber is determined indirectly, as the difference between 100 per cent and the sum of the organic extracts, ash, and total sulphur, it is important that the extracts represent as much as possible of the organic materials which were added to the rubber batch and which are not determined separately. Those who have tried to extract glue from a vulcanized compound containing it, by means of boiling water, know how tenaciously rubber clings to certain admixed materials. In this work it was our intention to ascertain as far as possible how much, if any, soluble organic material is retained in a compound after it has been extracted with acetone for eight hours and chloroform for four hours in the usual way.

The results obtained by successive extractions of cheap rubber mixtures containing mineral rubber and pine tar demonstrated that in the case of cheap compounds, the figure for rubber obtained by the "difference" method cannot be reliable at all, because of the retention of the organic material unextracted. As long as the ashing method is used it is clear that an accurate figure for rubber cannot be expected for this reason. At best it can be but an approximation.

Finding that such mixtures as acetone, carbon bisulphide, and acetone-chloroform, were more effective than the simple solvents in washing residues on Gooch pads, it occurred to us that if a constant boiling mixture of these solvents could be obtained, this mixture might find application in the extraction of rubber goods in the Soxhlet.

Ryland² found that a mixture of 55 per cent carbon bisulphide and 45 per cent acetone by volume has a constant boiling point of 39.25 degrees C. Likewise a mixture of 68 per cent chloroform and 32 per cent acetone by volume boils constantly at 64.7 degrees C. Accordingly, it was decided to extract samples of cheap rubber with acetone for eight hours, and then with such a constant boiling mixture, and compare the weight of extract so obtained with that obtained by means of pure carbon bisulphide, or pure chloroform.

From the results obtained, it is plain that chloroform is slightly better than carbon bisulphide as a solvent for extracting rubber, while the constant boiling mixture, whether it be 55 per cent carbon bisulphide, 45 per cent acetone or 68 per cent chloroform, 32 per cent acetone, is a much more efficient solvent than either carbon bisulphide or chloroform.

Further, one extraction with a constant boiling mixture may take the place of the two extractions, namely, acetone for eight hours, followed by chloroform for four hours, according to common practice in the rubber laboratory to-day. To ascertain whether such a substitution would be possible, the following mixture was made by distilling a mixture of 55 per cent by volume of carbon bisulphide and 45 per cent by volume of acetone over copper at a temperature of 39.25 degrees C. The solvent therefore contained no sulphides or free sulphur so that sulphur determined in the extracts could not be attributed to the solvent. Likewise, the mixture of 68 per cent by volume of chloroform and 32 per cent by volume of acetone was freshly distilled, and contained no sulphur.

A study of the results with these mixed solvents reveals that:

(a) A small amount of sulphur, usually less than 0.1 per cent is extracted by the chloroform.

(b) About the same amount of sulphur is extracted by the mixture of 55 per cent carbon bisulphide and 45 per cent acetone when it is used in place of chloroform.

(c) Either mixture extracts from the original sample, in eight hours, as much or more material than the sum of the extracts obtained by the eight-hour acetone extraction and the four-hour chloroform extraction.

(d) Either mixture extracts from the original sample, in eight hours, as much or more material than the sum of the extracts obtained by an eight-hour extraction with acetone and a four-hour extraction with a mixture of 55 per cent carbon bisulphide and 45 per cent acetone.

(e) The free sulphur present in the extracts obtained by the use of the mixtures is usually from 0.1 per cent to 0.3 per cent higher than the amount present in the acetone extract.

(f) There seems to be no advantage in extracting 12 hours or longer with the mixed solvents, since the figures are at the maximum in eight hours.

(g) The mixture of carbon bisulphide and acetone does not decompose during the extraction to liberate sulphur or sulphur compounds and in this way affect the free sulphur determination.

(h) The mixture of 68 per cent chloroform and 32 per cent acetone produces heavier extracts than that of 55 per cent carbon bisulphide and 45 per cent acetone.

Determination of the effect of the mixed solvents was made on high-grade stocks for the purpose of ascertaining what varying solvent effect they would have on vulcanized rubber.

Four compounds containing (A) 70 per cent, (B) 85 per cent, (C) 95 per cent and (D) 45 per cent of rubber, respectively, were extracted eight hours with acetone and four hours with chloroform and then one was subjected to four hours' additional extraction with chloroform, another to four hours with 55 per cent carbon bisulphide, 45 per cent acetone, and a third to four hours with 68 per cent chloroform and 32 per cent acetone.

All three solvents dissolve vulcanized rubber to an extent which seems to depend upon how heavily it is compounded. It is interesting to note that the mixture of 68 per cent chloroform—32 per cent acetone exhibits this ability to dissolve rubber to a marked extent. The rubber dissolved by it in the above is nearly twice that dissolved by pure chloroform. On the other hand, the mixture of 55 per cent carbon bisulphide—45 per cent acetone hardly exhibits this ability at all, so that the rubber dissolved by it is inappreciable as compared with that dissolved by chloroform or the mixture of chloroform and acetone. Obviously, this is a point in favor of the use of the mixture of 55 per cent carbon bisulphide—45 per cent acetone.

These results obtained by the carbon bisulphide-acetone mixture on these high-grade compounds are in every case lower than the sum of the acetone and chloroform extracts. The figures for free sulphur are also in accordance with previous statements given here. It is evident, therefore, that it is highly advantageous to use the mixture of carbon bisulphide and acetone to take the place of acetone and chloroform, because of this less active solution effect upon rubber as shown.

Before recommending the adoption of this mixed solvent, a few words must be said about deterioration of the solvent, and blank extracts that will form in it. It was found that the freshly distilled mixture would give no blank, and at the end of two weeks would still give no blank. However, at the end of a month's storage 75 cc. of the mixture would give a residue which, although it contained no sulphur, yet weighed up to 0.006-gram. Therefore, it is advised that where the mixture is being used in large quantities for routine analysis, it be redistilled over copper every week. Where it is used only occasionally, it should be mixed up fresh and distilled before using.

¹Abstract of paper by S. W. Enstien, assistant chemist, and R. L. Gonyo, laboratory assistant, Bureau of Standards, Washington, D. C., read before the Rubber Division of the American Chemical Society, at Philadelphia, Pennsylvania, September 2-6, 1919.

²Ryland, "Journal of the American Chemical Society," 1899, volume 22, page 384. See also Young, "Fractional Distillation," pages 68 and 69.

SUMMARY.

1. Extraction for eight hours with acetone followed by four hours' extraction with chloroform does not remove all soluble material from some rubber compounds.

2. After a rubber sample has been extracted with acetone it was found that:

(a) Chloroform in every case extracted slightly more material than carbon bisulphide.

(b) Constant boiling mixtures such as 55 per cent carbon bisulphide—45 per cent acetone and 68 per cent chloroform—32 per cent acetone extracted from many cheap compounds considerably more material than either chloroform or carbon bisulphide.

3. The constant boiling mixture of 68 per cent chloroform and 32 per cent acetone exhibits a marked ability to dissolve vulcanized rubber, as contrasted to the mixture of 55 per cent carbon bisulphide 45 per cent acetone which hardly exhibits this ability at all.

4. It is recommended that the constant boiling mixture 55 per cent carbon bisulphide and 45 per cent acetone be used in place of acetone and chloroform to extract rubber samples since:

(A) It eliminates one extraction with the necessary weighings.

(B) Extraction is complete in eight hours, while the acetone and chloroform extractions require a total of twelve hours.

(C) The extraction of free sulphur is complete.

(D) A rubber analysis in which the mixed solvent is used is more accurate than that in which acetone and chloroform are used separately because:

1. Little or no rubber is dissolved by this mixture, as compared with chloroform which will in some cases dissolve considerable quantities.

II. The extraction of cheap rubber compounds is more nearly complete, since the extracts obtained are greater than the sum of the acetone and chloroform extracts.

SYNTHETIC RUBBER OF GERMAN MANUFACTURE.

A number of different types of synthetic rubber have been prepared, all of them by the gradual polymerization of butadiene, mono-methyl butadiene (isoprene), or di-methyl butadiene (methyl isoprene). Each of these three original substances yields a different type of synthetic rubber of different composition and properties. Only that obtained from mono-methyl butadiene or isoprene is supposed to give a product of the identical composition of natural rubber, but even this is very doubtful. All the products have properties in some way resembling rubber, but that obtained from di-methyl butadiene, yielding the so-called methyl rubber, was found by the Germans to be the most useful as a substitute for natural rubber, particularly for the manufacture of vulcanite plates for accumulator cells, believed to have been used in large numbers for U-boat equipment.

In many ways these synthetic rubbers behave like a partly vulcanized rubber. Probably oxidation sets in during preparation, and this would be sufficient to account for the semi-vulcanized condition. Thus raw rubber, when mixed with powerful oxidizing agents such as "benzoyl peroxide" and heated, yields a product resembling vulcanized rubber. For this reason the specimens do not dissolve in benzene, cannot be rendered properly plastic on the hot rolls without the addition of aids to plasticity, and vulcanize badly. It is also known that synthetic rubber tends to oxidize in the air, and that to obtain satisfactory vulcanized products, it is necessary to use relatively large quantities of powerful accelerators.

There appears to be no doubt that Germany used large quantities of synthetic rubber, particularly this methyl rubber, during the war, but the product cannot compete with natural rubber either in quality or price under normal conditions. ("The Bulletin of the Rubber Growers' Association," London, Volume 1, No. 3, November, 1919.)

CUMAR RESIN.

Cumar, a synthetic resin produced from coal-tar distillates, is gaining recognition in the rubber industry as a valuable compounding ingredient. Chemically it is a mixture of para-coumarone, para-indene and the polymers of other hydrocarbons found in coal-tar. In appearance cumar resembles ordinary resin, but its properties are radically different. It is uniform in quality, neutral, non-saponifying and non-oxidizing. It is not affected by water, acids, alkalis or salts. Exposure to the air or weather will not change it.

Cumar is soluble in all coal-tar solvents, turpentine, vegetable oils, carbon bisulphide, carbon tetrachloride, ether, acetone and most commercial solvents. It is insoluble in alcohol. Its specific gravity is 1.05-1.15. Nine different grades are available, classified according to melting point, ranging from 50-60 to 145-160 degrees C., and in color from clear light yellow to dark amber, gaged by definite color standards.

The softer grades, melting at 50-60 and 60-70 degrees C., are good solvents for rubber and are useful for softening the gum in the breaking-down operation. The hard grades, melting at 90-100 degrees C., is used extensively as a substitute for Pontianak and similar resins in rubber compounding. Cumar mills readily into the rubber on the rolls and adds tackiness and plasticity to the unvulcanized stock. It is of value also in the manufacture of rubber cements and reclaimed rubber.

VARIABILITY OF CURE OF SLAB RUBBER.

Researches of Dr. H. P. Stevens on the variability of cure of slab rubber show results which negative the conclusions of the agricultural chemist of the Federated Malay States as to the "remarkable uniformity" of slab rubber.

Slab rubber has a repulsive appearance, especially on arrival at destination. The surface is dark and slimy from the exudation of serum. It is usually moldy, and the smell is very offensive. The slab can be washed and creped on the plantation with a relatively small loss in the rate of cure. The rubber in this form is much more presentable, but the color is dull and the rubber frequently streaked. Experiments on a manufacturing scale have resulted in the production of crepe from matured coagulum of a uniform pale shade. The color was less bright than that of ordinary crepe but sufficiently good to pass as standard crepe. Of three sample cases of crepe tested, the first cured 34 per cent faster than that prepared ordinarily, two other cases cured 67 and 57 per cent faster, respectively. Hence, although all sample cases contained more rapidly curing rubber and were prepared in the same manner, the rate of cure showed appreciable variation.

SYNTHETIC ACETIC ACID AS A LATEX COAGULANT.

Synthetic acetic acid produced from calcium carbide is not of the purity of that obtained from pyrolysogenic acid, as the synthetic acid is brown in color and has a distinct odor. It is, however, free from copper and suitable for latex coagulation, as the amounts of brown coloring matter in the acid are not sufficient to affect the color of the finished rubber.

Experimental data show that synthetic acid coagulated specimens of both crepe and smoked sheet are practically identical with the corresponding samples coagulated with ordinary acetic acid. ("The Bulletin of the Rubber Growers' Association," London, Volume 2, No. 1, January, 1920.)

LEAD OLEATE.

A preparation of lead oleate is now on the market for use as a mild accelerator of vulcanization. It is marketed as an oleaginous mass of wax-like consistency, fracture, and melting point. It is non-poisonous, and gives off no fumes. It has no tendency to cause scorching in mixing or calendaring. It may be used in conjunction with aniline or hexamethylene tetramine but should not be used with thiocarbonyl.

LABORATORY APPARATUS.

APPARATUS FOR DETERMINING VISCOSITY OF RUBBER.

A NEW MECHANISM for the determination of the viscosity of rubber under varying conditions of temperature and pressure is here illustrated.

The apparatus comprises a cylinder A bracketed to a table and cored out at B for the circulation of steam. A hole runs axially through the cylinder in which at its enlarged lower end a nut C is screwed holding the fixed lower gripping disk D. Gripping disks D and E are provided with radial teeth for engaging the test sample F. The upper disk E is attached to the vertical spindle G, which is made to turn by a cord passing around the grooved horizontal pulley H, thence over the pulley I and suspending weight J. The angle of rotation is indicated by a pointer K attached to the horizontal pulley H. The location of the pointer is adjustable by the thumb nut L. The pressure upon the sample F under test is regulated by weights M placed over the extension of the spindle.

RUBBER VISCOSITY TESTER.

Stocks of a certain grade should show a definite travel for known conditions of pressure, torsion, temperature and time, these being known for standard stocks, a comparison of samples is easy. It is the viscosity of the rubber which permits the larger part of the movement indicated on the scale.

The coefficient of viscosity may be determined directly by this apparatus. A calibration chart can be prepared, showing the coefficient of viscosity corresponding to different amounts of travel of the pointer in a unit of time for different conditions of pressure, torsion and temperature, and, those conditions being known and the travel of the pointer determined, the coefficient of viscosity for the sample in hand may be read directly from the chart. (Ralph B. Naylor, Springfield, assignor to The Fisk Rubber Co., Chicopee Falls—both in Massachusetts. United States patent No. 1,327,838.)

SOLDERLESS TERMINALS.

Electrical connections that are intended to be permanent or perfect or both, are made by the use of solder. Such a connection, however, is subject to impairment when under strain.

DIRECTIONS FOR INSTALLING "MELIORATE" TERMINALS

No. 3—Force sleeve into position

The solderless terminal overcomes all the inconveniences inherent in the soldered connector, and is unique in design and execution. It is known as the "Meliorate Terminal," and its con-

struction and method of use are clearly shown in the illustration. Polarity is indicated by a black or red sleeve of a hard, strongly dielectric material that can withstand the hardest usage. (Standard Scientific Co., 70 Fifth Avenue, New York.)

CHEMICAL PATENTS.

THE UNITED STATES.

LEATHEROID AND PROCESS OF MANUFACTURE, comprising an admixture of leather, rubber, casein and an alkali earth metal oxide. (Bernhard Fritsch, Cincinnati, Ohio. United States patent No. 1,334,297.)

METHOD OF RECLAIMING RUBBER, consisting in dividing the rubber into pieces, placing it loosely in a chamber, expelling the air from the chamber by the injection of steam under pressure, and heating the rubber while in a loose condition in the chamber by an externally applied source of heat. (Douglas Frank Twiss, assignor to The Dunlop Rubber Co., Limited—both of Birmingham, England. United States patent No. 1,335,926.)

RUBBER PRODUCT AND COMPOSITION. As new compositions of matter, solutions containing in a common solvent, more than 50 per cent of rubber and from about ten to 30 per cent of a semi-solid to solid bitumen obtainable by the destructive distillation of coal tar pitch. (John M. Weiss, assignor to the Barrett Co.—both of New York City. United States patent No. 1,334,060.)

THE UNITED KINGDOM.

VULCANIZABLE CONDENSATION PRODUCTS.—Obtained by passing a vaporized mixture containing dienes such as isoprene, for example, the mixture of gases and vapors obtained by cracking mineral oil under high pressure, over a heated contact mass (bauxite, fuller's earth, clay, animal or vegetable charcoal, etc.) at a temperature above the melting-point of the resin formed, say from 110 to 250 degrees C.; the molten resin is drawn off from the bottom of the contact vessel and solidified. The product is soluble in alcohol or ether, and may be used in the manufacture of varnishes, coating compositions, plastic compositions, insulating materials, etc., and may be vulcanized. (Hall Motor Fuel, Limited, Pinners Hall, Austin Friars, London, England. [H. V. Dunham, Brattleboro, Vermont, U. S. A.] British patent No. 138,046.)

THE FRENCH REPUBLIC.

RUBBER COMPOSITION.—An improved process for the manufacture of rubber compounds. (N. D. Nielsen. French patent No. 500,174.)

AUSTRALIA.

RUBBER SUBSTITUTE.—The process and product which consists in combining fish oil and sulphur in the presence of heat and resubjecting the resultant combination to heat under pressure. (Morton Gregory, assignor to Western Rubber Co., both of Tacoma, Washington. Australian patent No. 5,882.)

PRESERVATION OF RUBBER.—A process for preserving india rubber. (F. E. Stowe, New South Wales. Australian patent No. 3,364.)

GERMANY.

SPONGE RUBBER.—Coagulating rubber latex under conditions producing a porous or spongy coagulum and fixing the pores by vulcanization. (Philip Schidrowitz and H. A. Goldsborough, London, England. German patent No. 321,092.)

AMERICAN-MADE FILTER PAPER

Acid-washed filter paper for quantitative chemical analysis, which paper was formerly imported, is now being made by a small paper-making plant in New England, which is said to have capacity for this purpose more than sufficient to meet the entire American demand.

AMERICAN CHEMICAL SOCIETY. RUBBER DIVISION MEETING.

THE SECOND MEETING of American rubber chemists, organized as the Rubber Division of the American Chemical Society, took place at the fifty-ninth meeting of the society at St. Louis, Missouri, April 14-15, 1920.

Brief abstracts of the papers presented at the Rubber Division meeting are given below:

BROMINE ADDITION TO RUBBER.

When rubber is treated with bromine, both addition and substitution occur but by determining these separately the unsaturation is found to be one double bond for each isoprene unit.—W. K. Lewis and William H. McAdams.

RECOVERY OF VOLATILE SOLVENTS.

Solvents can be recovered by absorption, compression or refrigeration. Each method has its own distinctive field. These fields are brought out and the chief features of each method are also explained.—W. K. Lewis.

THE DETERMINATION OF TRUE FREE AND TRUE COMBINED SULPHUR.

Sulphur is considered present as free and combined. Acetone soluble sulphur may be partly combined with resins, etc., as may the sulphur insoluble in acetone, heretofore considered as combined with rubber. The total acetone extract is soluble in alcohol, but if alcohol saturated with sulphur is used, none of the truly free sulphur will dissolve and hence can be separated from the remainder of the extract. Results show about 0.4 per cent sulphur combined with resins.

About 85 per cent of *Hevea* resins are saponifiable and hence any resinous sulphur compounds insoluble in acetone may be soluble in alcoholic potash. Acetone extracted sample is boiled 8 hours with alcoholic potash and about 0.25-0.30 per cent sulphur extracted.

So far only pure gum stocks have been investigated.—W. J. Kelly.

SMALL AMOUNTS OF MAGNESIA AND CERTAIN ORGANIC SUBSTANCES AS ACCELERATORS.

The activity of small amounts of extra light magnesia was compared with the effect of similar amounts of certain organic substances. The load required to effect a given extension was found to be fair measure of the rate of cure of the mixture which contained magnesia. This was not found to be true for the mixtures containing the organic accelerators. The accelerating activity of magnesia in small amount was found to be of secondary character, acting in conjunction with certain extraneous substances, probably nitrobenzene, present in the rubber. The amount of these extraneous substances was found to limit the activity of magnesia as an accelerator.—G. D. Kratz and A. H. Flower.

OBSCURING POWER OF PIGMENTS.

The fineness of pigments can be determined by measurements of turbidity and be expressed in absolute units.—W. K. Lewis.

EFFECT OF COMPOUNDING INGREDIENTS.

Compounding experiments in which up to 50 volumes of filler were added to 100 volumes of rubber are described. The values of tensile strength are also corrected for actual volume of rubber present. Tensile strength calculated on area at rest is unfair to pure gum stocks. Tensile at break is suggested as a better means of comparison. This is calculated on the actual cross section at break rather than on the original cross section. A correction factor, due to volume increase during stretching, is also involved. A visual picture of the structure of rubber is given. This is based on the hypothesis that large colloidal aggregates function as elastic fibers and the smaller as plastic material. Vulcanization is said to lock up these fibers to form a network.—C. O. North.

PHYSICAL TESTING OF RUBBER GOODS.

The report of the Committee on the Physical Testing of Rubber Goods was accepted as it stands with the understanding that this committee will attempt to correlate its work with the various other technical societies in the country in order to get unit specifications agreeable to all.

A METHOD FOR THE DETERMINATION OF PERMANENT SET ON VULCANIZED RUBBER GOODS.

Before vulcanization, rubber compounds are plastic. During the cure they are changed to a more or less elastic state. However, there is always a certain residuum of plasticity in the cured compounds. In addition to this there is undoubtedly an arrangement of the elastic material which may be likened to a network of fibers which do not all lie in a line with the direction of the stretching. Under tension these fibers are straightened out and do not again return to their original positions. There is evidence that these fibers may be of irregular shapes, having bends or knuckle-like projections such that in one stretch these projections will cause the fibers to catch, but upon release of tension this hold will be loosened so that on another stretch measurably more elongation will be produced by the same tension. If these elastic fibers are stretched beyond their elastic limit, some of the bonds will be broken causing an apparent set which should not be counted against the stock. The set test then should be such that it will bring out the inelasticity caused in the stock, (1) by plastic flow, (2) complete straightening of the fibers, including those tangled.

Three methods have been considered for accomplishing this, the possibilities of which may be summed up as follows:

(A) Decrease in tension under given constant elongation.

This method shows no advantage and results do not indicate any direct association with the thing we wish to measure; it is a case of measuring length by units of weight. The test involves expenditures of time and money, which render it impractical.

(B) Increase in elongation against time under constant load.

Reliable results can only be obtained by repeated applications of the load, each of which should remain on the piece for a matter of hours. In spite of its merits, this test was therefore abandoned because it was considered impractical.

(C) Stretching for a given period of time to a given elongation, releasing, resting, and repeating until there is no further set.

The most practical method for measuring set reliably by this method was worked out as follows:

Compounds were selected representative of pure gum, cheap friction, high and low gravity tread, cheap tread, and cheap mechanical goods stocks. Four each of these pieces were stretched to ten per cent of the breaking elongation four times, held for ten minutes each time, rested ten minutes between stretches and finally ten minutes after the final release the set was measured. The results appear in Table I.

TABLE I. PERCENTAGES OF SET.

	Per Cent Elongation.							
	10.	20.	30.	40.	50.	60.	70.	80.
Pure gum	0.0	0.0	2.0	8.0	6.0	6.0	8.0	16.0
Cheap friction	0.0	1.0	3.0	6.4	8.5	16.5	27.5
Friction	0.0	0.0	4.0	0.0	1.0	8.0	20.0	24.0
Low gravity tread	0.0	1.0	7.0	10.0	17.0	25.5	41.0	51.0
High gravity tread	0.0	1.0	7.0	12.6	19.0	29.5	49.0	53.5
Cheap tread	0.3	2.0	6.0	12.5	27.5	33.5	40.0	34.5
Mechanical	1.0	3.0	5.0	14.5	23.5	52.0	42.0	59.0

In every case a point was reached beyond which the set went up abruptly. This point, we believe, represents the limit of the range. It seemed impractical to make a separate limit for each compound or class of compounds. In the majority of cases the break in the curve occurred between 60 per cent and 70

per cent. Accordingly 60 per cent of the breaking elongation was fixed as the most desirable point to which to stretch.

EFFECT OF SUCCESSIVE STRETCHING.

Ten pieces of stock were broken and the average elongation taken. Ten pieces of each stock were then stretched to 60 per cent of this elongation held ten minutes, released and measured after ten minutes. This was repeated to four stretches. The results shown in Table II are each the average of ten tests:

TABLE II. EFFECT OF REPEATED STRETCHING ON SET.

Stretch.....	Permanent Set after Each Stretch.				Total Set.	Set by First Stretch Figured to Percentage of Total Set.
	1st.	2nd.	3rd.	4th.		
Pure gum.....	4	1	0	0	6	66
Cheap friction.....	13	2	1	0	16	81
Friction.....	4	2	2	0	8	30
Low gravity tread.....	18	1	5	1	25	72
High gravity tread.....	14	6	4	1	25	56
Medium gravity tread.....	19	12	8	1	40	47.5
Cheap mechanical.....	22	9	8	1	40	50

Attempts have been made to reduce the time required for stretching and resting between stretches, but the results do not seem quite reliable, although for routine laboratory work we have used a shorter time. After using this method for two years, while we do not consider it perfect, we believe it far superior to any other method which has been proposed.—Earle L. Davies.

THE VALUE OF SHODDY IN MECHANICAL RUBBER GOODS.

A chart was presented which gave the cost relations between scrap rubber and reclaimed rubber. The reclaimed rubber was evaluated on a basis of tensile strength and compared to a corresponding priced new rubber. A line of demarcation through the center of the chart showed where it was more economical to use new rubber or reclaimed rubber.—J. M. Bierer.

RUBBER CHEMISTRY FROM THE COLLOIDAL VIEWPOINT.

The mechanism of crystallization, condensation, polymerization and coagulation was discussed. Gelation is one type of coagulation. Selective adsorption is given as a reason for the increased tensile strength of compounded rubber. This deals with the different surface energy of rubber and the various compounding ingredients.—Ellwood B. Spear.

JAR RINGS AND POISONED OLIVES.

NUMEROUS FATAL CASES of poisoning due to eating olives put up in glass jars have occasioned an inquiry by the United States Department of Justice as to the part alleged to have been played by rubber rings on jars. The president of one large packing concern in California, who started the investigation, claims a conspiracy by Germans during the war to poison this food product. He believes that the company from which he bought all its rubber vacuum jar seals for the olives put up in 1917 was victimized by sympathizers of Germany; and he is confident that analysis now being made by government chemists of the rubber used and the toxins said to have been produced in the olive solution, will confirm his claims.

His company, he said, lost \$100,000 in spoiled goods, the first and only packs giving trouble being those of 1917 and 1918, and in which the suspected rubber was used. He believes that some enemy agents tampered with the rubber mixture in the making, not only by causing it to deteriorate in a short time, but that they also introduced into the rubber germs of a malignant disease. As soon as the rubber gave way, air entered the jars and the "bugs" produced toxins in the olives. Had the rubber been "glycerined" he believes the trouble might have been lessened or obviated. Careful checking, he says, showed that goods with perfect seals—the same olives being used—gave no trouble at all.

The Chicago concern which supplied the jar rings, received complaints from many other purchasers about similar goods, and the explanation given was that the company had trouble in

getting pure rubber owing to the Government's demands for war needs.

As the federal government investigation findings may not be disclosed for a year, private agencies are trying to find out on their own account if it is likely the rubber seals could be poisoned in the manner suspected.

According to bacteriologists the olive-poisoning was caused by a bacterium known as botulinus, first isolated by German savants from spoiled sausage meat, although it is also found in canned animal products which have been known to cause ptomaine poisoning. It is described as obligate anaerobic, that is, it thrives best when deprived of oxygen or common air, and needs neither to develop a powerful toxin. It is possible, it is believed, to embed spores from such bacteria in suitably prepared rubber so that they might after a certain period and under favoring conditions harmfully affect foodstuffs in contact with such rubber. The fact that the spores are remarkably tenacious of life lends some color to the story that the poisoning was timed by enemy agencies through a rotting of rubber seals.

Certain it is, say the bacteriologists, that dry heat at 230 degrees C. will kill the botulinus, and it can also be destroyed by prolonged boiling at 212 degrees F.

On the other hand, the processes of rubber manufacture, specifically jar-ring making, are not perhaps understood by the scientists. They agree that sufficient heat will kill the germ. Granting that a germ-distributing German introduced the bacteria into a batch of ring stock on a mixing mill, the germs during the process of mixing would be subjected to a heat equal to that of boiling water for at least fifteen minutes. If the stock went at once to the tubing machine and was run off it would get another fifteen minutes of the same heat. Or if the rings were made by wrapping the stock in sheet form about a mandrel the heat of the warmer and the calender would be considerable.

The real exposure to heat, however, would be during vulcanization. Here the germ would have to stand certainly 300 degrees F., say for an hour and a half, depending of course, upon the grade of stock used.

In addition to this would be the presence of zinc and sulphur, which are certainly not germ food. It must be a fairly robust germ, extraordinarily tenacious of life that will survive entombment and vulcanization in a jar ring.

RUBBER FOOTWEAR ACTIVE.

Present indications encourage the belief that the year 1920 will establish the record to date in the demand for rubber footwear of all kinds. An exceptionally snowy winter, which did not get its stride until after the new year came in, taxed manufacturers of arctics, overs and boots to capacity. With the passing of Easter and the coming of numerous signs of an early spring, other lines came to the front. Thus far, the demand for seasonable goods has been unusually large, and the variety of handsome styles of rubber and fabric shoes is great enough to attract many away from leather shoes for summer wear, especially in view of the continued high prices of leather shoes.

The less expensive athletic and outdoor shoes are rapidly increasing in popularity, affording economy, durability, comfort and attractiveness. Incidentally the high cost of leather footwear is increasing the demand for overs and footholds in order to protect the leather from water damage. Rubber boots are becoming regarded more and more as a necessary part of every man's outfit, and a comparatively new foot covering known as the rubber bootie is coming into popularity. It resembles the arctic overshoe, but has the quality of a rubber boot as far as it goes. Thus in many ways rubber footwear in its varied forms is rivaling leather footwear and for many purposes in certain seasons is a very practical "substitute."

New Machines and Appliances.

IMPROVED CLICKING MACHINES.

FABRIC CUTTING PRACTICE in the rubber factories of this country is showing a strong tendency toward the use of clicking machines in place of the old-style beam dinker. Two types are used—one for quantitative and qualitative cutting of all fabrics, and the other on work of a lighter nature.

MODEL B. CLICKING MACHINE FOR GENERAL WORK.

In the use of the clicking machine many advantages are claimed over the old-fashioned method; it eliminates the great

liability of injury; it is less laborious to operate, and it is more economical in the use of materials, in that the percentage of scrap is reduced to the minimum.

The cutting block of the ordinary dieing-out machine is a very inconvenient height and some of the dies are heavy and hard to move. In the clicking machine the working surface is at a restful height and in plain view; the die is light in weight and easily shifted and practically all danger of operating has been eliminated. With the fabric directly below his eyes on the cutting board the workman can place his dies on the clicking machine to cut more economically.

One of the greatest advantages claimed for the clicking machine is the accuracy of its work. On the beam dinker a heavy die is forced through many thicknesses of fabric, causing the material to spread, thus producing inaccurate cutting. (United Shoe Machinery Corporation, Albany Building, Boston, Massachusetts.)

A NEW ENCLOSED MIXING MACHINE.

In the accompanying illustration is shown a mixing machine of the enclosed type, possessing structural features that are designed to produce a maximum product in a minimum of time.

The frame of this machine is of substantial construction and sufficiently high so that the clearance of the mixing tank from the floor is at least 30 inches when tilted. The mixing tank is made of close-grained gray iron casting and jacketed and the inside is machined smooth. The heads are also made of close-grained gray iron casting, and are fitted with special stuffing boxes. The agitator is of special design, capable of mixing the rubber with the compound thoroughly. The agitator shafts are hollow and provided with heating or cooling fixtures.

THE FINCO MIXER.

The dust-proof feed-hopper is clamped tightly on the mixing trough when the machine is in operation. It contains separate compartments for the various materials, which are fed into the mixing trough by a compression feeding device that forces the required amount into the mixing trough. To increase efficiency, a dustproof compression cover can be raised sufficiently high to allow the dumping of the mixing tank for discharge. Means are provided for tilting the mixing tank either by hand or power.

This type of machine is only built in 75 gallons capacity, weight 3,400 pounds. (The East Iron Machine Co., Lima, Ohio.)

MODEL C. CLICKING MACHINE FOR LIGHT WORK.

AUTOMATIC MACHINE FOR WEIGHING RUBBER INGREDIENTS.

In "Rubber Machinery," by Henry C. Pearson, the possibilities of an automatic machine for weighing compounding ingredients was suggested. "It is a swift, accurate and secretive weighing mechanism which works faster than any expert human weigher. The suggestion is that a gang of these machines could handle the ingredients that go to make up a compound, one machine to weigh whitening, another litharge, still another sulphur, and so on. Each machine takes its material from a bin, weighs it and delivers it into a common pan."

AUTOMATIC PIGMENT WEIGHER. The realization of this prophecy is shown in the two illustrations herewith—one of the actual machine and the other, an installation plan of several machines. Each machine automatically weighs a different ingredient and discharges it into the compound boxes as they pass under

SECTION OF SIX-GANG COMPOUND WEIGHING INSTALLATION.

each machine. (Automatic Weighing Machine Co., Newark, New Jersey.)

PEERLESS DUPLEX HACK-SAW BLADES.

This radical improvement in hack-saw blades consists in fine teeth at the toe and coarser teeth at the heel of the blades. The advantages of this design are obvious to every hack-saw user. At the beginning of the cut and on each succeeding stroke, the fine teeth at the toe of the blade cut easily and true at the slow starting speed, preparing the way for the faster cutting of the coarser teeth which come into play at high speed, as the rest of the blade enters the work.

Peerless duplex blades are made in two types; all hard tungsten steel and flexible carbon steel. The former is especially adapted for use by tool makers in cutting tough steels, and by expert mechanics for general use.

The carbon steel flexible type is hardened on the tooth edge only. The remainder of the blade is only toughened to prevent excess stretch when tensioned. In plumbing, electrical and steam-fitting work, or in other trades where the material to be cut is of thin, irregular section, and where the work cannot be held rigidly in a vise or reached from an easy sawing position, it is the first choice of all good workmen. (Peerless Machine Co., Racine, Wisconsin.)

MAGNETIC CHUCKS.

Milling, planing, grinding and turning machines are now being equipped with magnetic chucks that have fully demonstrated their superiority over the old-fashioned jaw-chucks.

An interesting development is the use of magnetic chucks for grinding rubber gaskets and hard rubber electrical products. This is accomplished by two steel plates provided with "V" slots that grip the work through action of the magnetic chuck on the steel plate. This will be more readily understood by reference to accompanying illustration. This particular work is

RUBBER GASKETS OR HARD RUBBER ARTICLES HELD IN MAGNETIC CHUCK OF SURFACE GRINDER.

carried out on rotary surface grinders that are arranged with rotary magnetic chucks and are very accurate and fast for this class of work. (The Heald Machine Co., Worcester, Massachusetts.)

PORTABLE ELEVATOR OR PILING MACHINE.

This portable elevator for elevating cases, bales, barrels, etc., for piling purposes, is a combined hand and motor operated machine. It is similar in construction to hand-operated and motor-operated portable elevators, but is equipped with a crank for hand operation, and with a small motor, the cord and plug of which may be conveniently attached to an ordinary lamp socket. The motor is small enough to be thrown directly on the line without the use of a starting box and is controlled by a simple knife-switch mounted on the elevator. The change from one form of operation to the other may be instantly effected.

UPPER
VIEW
HAND
OPERATED.

LOWER
VIEW
MOTOR
OPERATED.

THE COMBINATION REVOLVATOR.

The advantage of this feature is apparent. The elevator may be operated by motor wherever current is available and by hand in those odd corners of the plant where current is unavailable. When operating by motor the manual labor of cranking is eliminated and a load as heavy as 1,800 pounds may be raised at approximately three times the speed attained by the average man operating by hand.

The machine may be furnished with any one of three different types of bases, revolvable, non-revolvable, or open and for use in connection with skids. The motor attachment may be fur-

nished for application to any hand-operated portable elevator. (Revolver Co., Jersey City, New Jersey.)

A DISK TYPE FRICTION CLUTCH.

The simplicity of construction and the mechanical features embodied in the friction clutch here shown should recommend its use to rubber engineers.

The continuous friction surfaces consist of three parts that are dust proof. The friction plate on the standard clutch is lined on both sides with continuous hard maple segments and can be removed for relining without disturbing the other parts. For special conditions the friction plate may be fitted with asbestos fiber, vulcanized fiber, or other friction surfaces. The pressure developed by the double toggles is such that the larger sizes of clutches are readily engaged and disengaged by means of ordinary hand levers, without the use of geared operating devices. The positive action of the double toggle movement in both directions, engages and disengages the clutch without the use of springs. The adjustment for wear is made entirely by one adjusting collar only, giving a uniform pressure on all parts of the friction surfaces. (A. Plamondon Manufacturing Co., 12-24 North Clinton street, Chicago, Illinois.)

THE PLAMONDON CLUTCH AND GEAR.

MACHINERY PATENTS.

MACHINE FOR MAKING STORAGE BATTERY SEPARATORS.

A composite body of rubber and fibrous material for making porous battery separators is formed on the machine here shown in side elevation and plan.

BATTERY SEPARATOR MACHINE.

When a strip of the desired thickness is formed, it is cut transversely and run off the drum by means of the chute G to a receiving table. A suitable number of these strips are superposed and compressed in a press vulcanizer where the composite body of rubber and fiber is semi-cured, after which it is cut into sections of the proper thickness. (Harry L. Boyer, assignor to Joseph Stokes Rubber Co., Trenton, New Jersey. United States patent No. 1,330,676.)

New Goods and Specialties.

A BRITISH RUBBER HAT.

THE SPRING trade in Britain is reported to be brisk in weather-proof and rainy-day hats, some of which are of oiled silk combined with velvet, others of oiled silk entirely. The woman's hat shown here, however, is of most interest to the rubber trade because it is made of rubber. It has a full, one-piece crown and a plain brim, wired, while the trimming consists of a band and bow of rubber of a contrasting color. The edge is of the same color as the trimming and the hat is lined but not reversible as are some of the models of oiled silk or mackintosh material. These hats are said to be in good demand in overseas markets as well as in Britain. (Edward Macbean & Co., Limited, Glasgow, Scotland.)

("The India-Rubber Journal.")

THE RUBBER HAT ABROAD.

BATHING CAPS OF THE SEASON.

Three attractive bathing caps pictured below represent some of the newer models which are being displayed at the present time. They are made of high-grade rubber in different colors trimmed with ornaments of contrasting shade. The "Victory" at the left is polka-dotted in white and has a full shirred body

"VICTORY" CAP.

"SERVICE" CAP.

DIVING CAP.

with enclosed sponge rubber head-band, this latter feature being patented, while an ornament finishes the top. The center cap, "Service," is patterned after a service cap. The seams are bound with rubber of contrasting color and the front is decorated with stars. The cap at the right is a large diving cap, having a round crown to which the body of the cap is neatly and securely bound. A buckle ornament in contrasting colors constitutes the trimming on one side, and the head-band is in two colors. (The Faultless Rubber Co., Ashland, Ohio.)

A BRUSH FOR THE HANDS AND NAILS.

Brush manufacturers, seeking to meet the popular demand

"O. D. S." NAIL-BRUSH.

for brushes having the bristles set in rubber, are putting something novel on the market every now and then. The brush at the left is for cleaning the nails and is made of the best black bristle securely vulcanized in a rubber block. It can be sterilized in boiling water without danger of the back coming off or splitting, a feature which appeals to those who insist on having personal belongings thoroughly sanitary.

POCKET HAIR-BRUSH AND MIRROR.

Women will appreciate the novelty illustrated here—a sanitary hair-brush which, with its mirror-lined cover, forms a pocket case of great convenience. The brush itself is of high-grade black bristle set in a rubber cushion which can be removed for the purpose of sterilizing. This is accomplished by light pressure of the finger and is replaced as easily. The cover contains a mirror. The aluminum case is light in weight and non-corrosive. Both the nail-brush and the hair-brush are made by the same concern. (O. Denning's Sons, Inc., Troy, New York.)

"O. D. S." POCKET HAIR-BRUSH AND MIRROR.

THE "ERIE CORD" TIRE.

One of the latest additions to the growing list of cord tires is the "Erie Cord." The design of this tire is both rugged and attractive with a remarkably bulky anti-skid tread of the highest quality of rubber composition. "Erie Cords" have been satisfactorily demonstrated in service tests and are being guaranteed for 12,000 miles. (The Erie Tire & Rubber Co., Sandusky, Ohio.)

"ERIE CORD" TIRE.

LUDINGTON ARMORED PNEUMATIC TIRE.

The Ludington armored pneumatic tire casing contains a layer of thin, flexible, resilient brass plates reinforcing the carcass from bead to bead, interposed as a layer dividing the fabric plies into two groups. The plates are laid snugly, edge to edge, at the tread but separate as they approach the bead. Above and below the layer of plates are thick plies of cushion rubber which unite along the side walls and prevent separation of the inner and outer layers of fabric plies, while the metallic layer serves to prevent both punctures and blow-outs. Each plate is corrugated midway between tread and bead to allow transverse movement for equalization of the air pressure and to obviate possible breakage of the plates by abrupt contact with hard obstacles on the road. (Ludington Rubber Co., Milwaukee, Wisconsin.)

RUBBER-SOLED BATHING SHOE.

Among the latest bathing novelties is the "Bruxshu" bathing shoe, embodying the best shoe-making principles, thus guaranteeing both fit and style. A corrugated rubber sole is fastened to the usual upper of fabric by a special patent process, and in some models there is a leather counter to support the back and low rubber heels to add to the wearer's comfort in walking on the beach. These shoes, it is claimed, will wear an entire season. (Brooks Shoe Mfg. Co., 1735 North Sixth street, Philadelphia.)

THE "BRUXSHU" BATHING SHOE.

A NEW THREE-IN-ONE TIRE.

The "Luck Botherless" tire claims to provide against rim cuts, blow-outs, punctures, sand blisters, etc., by its ingenious construction. The inner tube D is enclosed inside the fabric skirt B, which bears the rubber tread cushion G and is, in turn, inclosed within protective flanges of steel, fastened to the felloe E of the wheel. These flanges extend from near the bottom of the felloe to above the juncture of the solid rubber tread with the fabric skirt. An air space C is provided between the flanges A and the fabric skirt B of the tire, to prevent mud or grit from clogging. It also has a tendency to keep the tire cool. The heads have an extra heavy canvas covering and are protected by the steel flanges. (Luck Tire & Manufacturing Co., 325 Bolell Building, San Antonio, Texas.)

"LUCK BOTHERLESS" TIRE.

between the flanges A and the fabric skirt B of the tire, to prevent mud or grit from clogging. It also has a tendency to keep the tire cool. The heads have an extra heavy canvas covering and are protected by the steel flanges. (Luck Tire & Manufacturing Co., 325 Bolell Building, San Antonio, Texas.)

GAS OR SMOKE MASK.

A mask of improved construction, intended to protect workmen from gas, smoke, or dust is made of aluminum and rubber, as illustrated. It has an inflated face rim and is fitted with specially constructed spiral tubing so flexible that the natural air supply cannot be cut off by twisting or knotting. The tubing is carried by a belt and the head-piece fastens with adjustable elastic straps. (Improved Aluminum Gasco Protector Co., Chicago, Illinois.)

"GASCO" PROTECTOR.

EXPANDING AND CONTRACTING STOPPER.

No more unpleasant experiences with corks that do not fit the containers for which they are needed or that break in extraction. The one here pictured is a welcome novelty, indeed. It is made of pure red rubber, molded around a nickel screw,

"SAMPSON" ADJUSTABLE STOPPER.

traveling between two brass washers, firmly embedded and keyed in the rubber. This screw is swiveled in the lower washer to turn without engaging the thread. As the screw is turned to the right, the upper washer is brought closer to the lower one, thus expanding the rubber in between so as to enlarge its diameter, as illustrated in the cross-sectional view. The reverse movement forces the washers apart, elongates the rubber, and provides positive contraction, permitting the stopper to be easily withdrawn from the bottle or container. (The Sampson Appliance Corporation, 13 East 16th street, New York.)

A SILVER ANNIVERSARY CORD TIRE.

The new cord tire herewith illustrated, produced to celebrate the silver anniversary of pneumatic tire production, has a dis-

tinctive twin grip tread, with a center rib to support the weight of the automobile, while on either side there is a row of pave-

"KOKOMO CORD" TIRE.

ment-gripping wedges intended to stop any tendency to skid laterally. The color combination produced by the white tread and gray side walls is one which harmonizes with the finish of any car. (The Kokomo Rubber Co., Kokomo, Indiana.)

NOVEL SUB-TIRE.

A novel sub-tire that slips within any tire casing is made in all standard sizes and is said not only to protect the casing, but to double its life and prevent blow-outs.

Many automobile users seem to prefer the sub-tire to the uncertainties of retreading. An additional safeguard against injury to inner tubes is said to be provided by the sub-tire, and

PLANET SUB-TIRE.

the general wheel resiliency much enhanced. Although the product is but a new one, the sales now reach \$100,000 a year and the rapid growth of the business has necessitated the recent removal of the plant to larger quarters. (Planet Rubber Co., 223 East 9th street, Los Angeles, California.)

RUBBER SUIT AND SAFETY GOGGLES.

The diverse operations carried on in the modern industrial factory make an insistent demand for adequate protection for the workman. The rubber suit shown here is acid, fire and waterproof, provided with snap buttons on front and at wrists and ankles.

The rubber-rimmed goggles are air

RUBBER RIMMED GOGGLES.

"PROTEXAL" SUIT.

and gas tight, held by elastic straps. (The Safety Equipment Service Co., 204 East Ninth street, Cleveland, Ohio.)

THE SALVAGING OF TRUCK TIRES BY THE ARMY.

TO EFFICIENCY EXPERTS in the United States Army service, few things had been more distressing than the practice among soldiers of removing solid motor truck tires by direct application of heat. For a long while officers charged with the correction of wasteful methods vainly experimented in the hope of finding a better method. The difficulty lay, of course, in the adhesion of the hard rubber layer to the metallic wheel-bands. The soldiers removed the tires from the wheels easily enough but much rubber was ruined by heat and lessened in value as scrap, and generally the hard rubber base remained with the rubber.

The heat process was a makeshift at best, for often spoilage quite equalled salvage. Usually a dozen tires were piled on top of one another, being raised from the ground by bricks or stones, and the cracks between the rims were plastered with mud. A wood fire was built in the stack thus created, and in about five minutes the tires would fall off, provided they had been notched all the way through at one point before heating. The mud was used to keep the flames from coming through the cracks and burning the rubber, but too often it failed in its purpose.

Finally an improvement on the heat method was evolved at Camp Logan, Texas, and the process proved so satisfactory that a general order was issued by the United States Army Director of Purchase and Storage in Washington to all depot, camp and post supply officers to discard all other methods of removing rubber from steel bands and employ that devised at Camp Logan. The instructions were as follows: provide two posts or trees about 10 feet apart; a double and a single $\frac{3}{4}$ -inch block; 30 feet of $\frac{1}{2}$ -inch rope; two heavy steel knives 14 by 2 inches; two carpenters' $2\frac{1}{2}$ -inch wood chisels; a pricker to remove stones from rubber; one steel ring or a half dozen 6-inch rings of hay wire, doubled.

The tire is placed against the post, resting on the ground in an upright position and the rope wrapped once around the tire, then around the post and tied so that the tire may be shifted easily. On the other post the rope is wrapped twice and tied permanently about three feet from the ground. The double block is hooked on the post with a permanent tie and the single block played out to the tire.

With the knife cut across the top of the tire at a 45-degree angle, down to the iron rim and nick each side of the tire at the base of the cut. Slip one of the hay wire rings into the cut and pull tight to catch in the nicks at the sides of the rubber, hooking the single block in the wire ring.

One operative, handling the tackle, tightens up on the tire

carefully to start the rubber; a second operative helps to handle the tackle and steady the tire, and a third, using the wood chisel, cuts in at the edges where the rubber hangs.

As the blocks are steadily pulled, the rubber peels down to the cement, leaving the fabric and cement on the iron band.

UNITED STATES ARMY METHOD OF STRIPPING SOLID TRUCK TIRES. HEAT PROCESS SHOWN IN INSERT.

When the tire is peeled to the ground, it is shifted upward, the rubber again nicked at each side, the hay wire ring loosened from the peeled section and placed in newly cut nicks. The blocks are again attached and the peeling finished.

THE RIGHT AND WRONG OF A BLOW-OUT REPAIR.

The most frequent mistake made by repair men in repairing a blow-out is failure to remove the worn fabric from the injured

portion of the tire, the tendency being to add rather than replace layers of fabric. Here are shown three views of a four-inch, five-ply fabric tire which was repaired by adding eight plies of new fabric to the five plies of worn fabric in the tire.

After running a few hundred miles the tire blew out again. It was found on examination that eight plies of extra fabric extended to the point of the blow-out. In running, a "hinge" had formed at the merging point of the five- and the thirteen-ply sections that worked backward and forward, thus weakening the structure and causing the blow-out.

The lower picture shows a tire stripped back in the approved method of repairing a blow-out. All the fabric, except just enough for a foundation, has been removed in steps to avoid sharp breaks between the old and the new fabric. The repair man then begins the process of building up, carefully following the standard of practice and using only the best materials available.

(The R. E. Goodrich Co.)

UNSUCCESSFUL TIRE REPAIR PICTURED. UPPER LEFT—CROSS SECTION FIVE PLY TIRE BEFORE REPAIRING. UPPER RIGHT—AFTER REPAIRING, THIRTEEN PLYS INSTEAD OF FIVE. CENTER PICTURE—BLOW-OUT OCCURRED AT MERGING POINT OF FIVE AND THIRTEEN PLYS. LOWER—CORRECT METHOD OF FABRIC PREPARATION.

back in the approved method of repairing a blow-out. All the fabric, except just enough for a foundation, has been removed in steps to avoid sharp breaks between the old and the new fabric. The repair man then begins the process of building up, carefully following the standard of practice and using only the best materials available.

THE OBITUARY RECORD.

A GREAT MAN IN THE TELEPHONE INDUSTRY.

THEODORE NEWTON VAIL, chairman of the board of directors of the American Telephone & Telegraph Co., of which he had been president until last June, and also a director of the United

THEODORE N. VAIL.

States Rubber Co., died April 16, 1920, at the Johns Hopkins Hospital in Baltimore, of a complication of heart and kidney diseases, after a surgical operation had proved ineffectual. He had been brought to the hospital from Jekyll Island, off the Georgia coast, where he had passed the winter. He was in his seventy-fifth year, having been born June 16, 1845, in Carroll County, Ohio.

Mr. Vail's name was written as indelibly in the history of the telephone as is

that of Alexander Graham Bell, for his executive ability and faith in the invention were as essential to its successful practical establishment as were Bell's experiments.

Vail rose from the ranks. His family had moved to Morristown, New Jersey, when he was an infant, and there he went to school and attended the Morristown Academy, intending to be a doctor. He learned telegraphy and when he was twenty-one went West with his parents; there he worked for the Union Pacific railroad and attracted the attention of General Grenville M. Dodge, who had him appointed a clerk in the railway mail service. He organized the service so well that by 1876 he had been called to Washington as assistant, and soon after as chief superintendent.

He left the government service in 1878 to become general manager of the new Bell Telephone Co. The hard fight he made to put the company on its feet is one of the epics of American industry. Very soon he saw the possibilities of the long-distance service and fought hard to secure the capital for the lines from Boston to Lowell and to Providence, that demonstrated the feasibility of the idea. In 1885 he became president of the American Telephone & Telegraph Co. that was to develop that side of the business. By 1887 he was obliged to give up and attend to his health, when he retired to his farm at Lyndonville, Vermont.

In 1893 he visited South America and his spirit of enterprise was again aroused. At Buenos Aires he bought a horse-car line, applied electricity, established a telephone system, and devoted ten years to developing Argentina. In 1904 he retired again, returning to his Vermont farm. Then he lost his wife and his only son, and in 1907 was ready to accept the call to return to the presidency of the American Telephone & Telegraph Co. and try to straighten out its affairs. In three years he was enabled to buy out the company's old competitor, the Western Union, and in 1910 became president of that company also. In 1914 the two were to have been amalgamated, but the Government stepped in to forbid it. With the outbreak of the war and the Government taking control of both systems, Mr. Vail was put in charge, remaining at the head of both till they were returned to their

owners. This was only one of his many activities during the war. In June, 1919, he finally gave up the presidency of the American Telephone & Telegraph Co.

The large use of rubber in the telephone business, as insulating material for instruments and their parts, and for other purposes, naturally interested Mr. Vail in rubber. He shared in the development of the United States Rubber Co., and for some years has been a director.

Harvard, Princeton, Dartmouth and Middlebury conferred on Mr. Vail their honorary degree of Doctor of Laws, the University of Vermont made him a Doctor of Science and New York University a Doctor of Commercial Science. In 1912, Mr. Vail presented to the Massachusetts Institute of Technology the library of George Edward Deering, said to be the most nearly complete collection of books on electricity in the world; for this he is believed to have paid \$100,000. He also founded the Lyndon Agricultural School at Lyndon, Vermont.

Mr. Vail, besides being a director in many business concerns, was a trustee of the Boston Museum of Fine Arts and a director of the Boston Opera House, a member of the Metropolitan Museum of Arts, American Geographical Society, American Natural History Society, American Academy of Political and Social Science; of the New York, Union League, New York Athletic, Automobile of America, Metropolitan, Hobby, Jekyll Island, National Arts, Railroad, Sleepy Hollow, Westchester Country, Larchmont Yacht, Union and other clubs; and of the Sphinx and Royal Automobile Clubs of London.

In 1907, Mr. Vail married the second time and is survived by his widow.

PROFESSOR KARL DIETERICH, PH.D., DIRECTOR OF THE HELFENBERG chemical factory, died in Dresden at the end of March, age 51 years. He was interested in the employment of rubber and cognate materials in pavements, and published investigations in rubber and resins.

STATEMENT OF INDIA RUBBER WORLD.

Statement of the ownership, management, circulation, etc., required by the Act of Congress of August 24, 1912, of THE INDIA RUBBER WORLD, published monthly at New York, New York, for April 1, 1920. State of New York, } ss.:
County of New York, }

Before me, a notary public in and for the State and county aforesaid, personally appeared E. M. Hoag, who, having been duly sworn according to law, deposes and says that she is the business manager of THE INDIA RUBBER WORLD, and that the following is, to the best of her knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:
Publisher, The India Rubber Publishing Co., 25 West Forty-fifth street, New York City.
Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.
Managing editor, none.
Business manager, E. M. Hoag, 25 West Forty-fifth street, New York City.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock. C. Pearson, 83 Agawam Road, Waban, Massachusetts.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing and covering fully and completely the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by her.

E. M. HOAG, Business Manager.

Sworn to and subscribed before me this 31st day of March, 1920.

[SEAL]

THOMAS P. BURKE, Notary Public.

My commission expires March 30, 1921.

INTERESTING LETTERS FROM OUR READERS. RUBBER AND METALLIC SUBSTANCES APPLIED TO CLOTH.

TO THE EDITOR:

DEAR SIR: I am writing to ask if you know anything of the process used in decorating cloth like the enclosed sample.

I know it was an ancient art in India. The question is how to reproduce it with modern methods.

If you can refer me to any writing on the process of applying rubber to cloth which may be used with metallic substances, I shall be very grateful.

This is a technical subject about which I know very little and I was unable to get satisfaction from books.

I shall be very grateful to you for an early reply.

GRACE G. DENNY,

In charge of textile laboratory.

University of Washington, Seattle, Washington.

REPLY BY THE EDITOR.

The sample of cloth ornamented with gold flowers which you sent me is of exceeding interest. It may be a rubber product,

PERSIAN FABRIC ORNAMENTED WITH "GOLD AND RUBBER"

at least in part. The milk of a rubber tree, the *Ficus elastica*, was used in India more than a thousand years ago. It is probable that the rubber from it was also used. A native could easily make a thick rubber paste and apply it to fabric in crude lines of ornamentation; then, while still adhesive, dust it thickly with metallic powder. That used on the sample looks like pyrites. If it is, exposure of the decorated surface to the sun would result in the type of vulcanization known as solarization, or sun-cure, the three concomitants, rubber, sulphur (or a sulphide) and heat, being present. I do not, of course, assert that this is the fact, but it is not impossible.

I recall something of this sort of native work in Kuala Lumpur, F.M.S., where a coolie decorated his Chinese shoes with stripes in blue and crimson. The body of the stripe was freshly coagulated rubber exposed to heat to render the surface sticky. This was then dusted, one stripe with a blue powder, the other with a crimson. The whole was then thoroughly dried out in strong sunlight.

With regard to work of this type, in our own day Charles Goodyear did some very fine ornamental work on fabric and leather, using a thick rubber cement which was dusted over with "flock" of various colors. None of this work is in existence to-day, as far as I know.

Twenty-five to thirty years ago, when the rubber surfaced

"gossamer" was popular, the unvulcanized surface was ornamented by applying starches, and in a few instances, metallic powders, after which the garment was cured.

To imitate the sample to-day, a thick paste of rubber applied from a collapsible tube in the form of decoration, this to be dusted while sticky with bronze powder, brass filings, or any mineral powder desired. If the rubber paste is to be sun-cured, it should contain sulphur. Or it could be cured in dry heat, or, containing no sulphur, be exposed to the fumes of chloride of sulphur. There is no doubt that very beautiful and permanent decorative effects could be obtained by the process outlined.

THE EDITOR.

SPECIAL LIBRARY CENSUS.

TO THE EDITOR:

DEAR SIR: At a time when the Government is counting up its inhabitants, the Special Libraries Association is enumerating the special library collections of the country, because there does not exist at present an adequate directory of special libraries.

In the spirit of cooperation, and in order to list the special information sources of the country, the Special Libraries Association—the national body of special librarians—submits the following questions and respectfully asks you to take the trouble to answer them. When compiled, the directory will not be used as a mailing list for advertisers, but merely for the purpose stated, namely, to have in a central place, a record of the special information sources of the country.

A special library has been defined as:

A good working collection of information either upon a specific subject or field of activity; it may consist of general or even limited material serving the interests of a special clientele; and preferably in charge of a specialist trained in the use and application of the particular material.

If your library comes within the above qualifications, the Special Libraries Association will appreciate the following information from you:

- (1) Name of institution or company.
- (2) Name by which library is known.
- (3) Name of librarian or custodian.
- (4) Can it be classified as any of the following: Financial; business; legal; engineering or technical; institutional; municipal; reference; agricultural.
- (5) If not, how can it be classified?
- (6) Does it serve a special clientele?
- (7) Would your librarian be willing to assist other special libraries to a reasonable extent?

The above data should be sent to William F. Jacob, Chairman Library Census Committee, care of General Electric Company, Schenectady, New York, who will be glad to answer any questions relating thereto.

ON EXPANSION OF RUBBER COMPOUNDS DURING VULCANIZATION.

TO THE EDITOR:

DEAR SIR: I have read with great interest the paper on the "Expansion of Rubber Compounds during Vulcanization," communicated by C. W. Sanderson to the Rubber Division of the American Chemical Society and reprinted in your journal, February 1, 1920. Mr. Sanderson states that one of the first questions which arose in connection with the expansion of rubber was whether or not there was a break in the curve, or, in other words, a volume change at the point of vulcanization. The author does not, however, explain what he means by the point of vulcanization, and, as matter of fact, vulcanization has now been shown to take place perfectly gradually although it increases more rapidly than the rise in temperature. He also states that "we know that a physical change takes place, and that the specific gravity increases." The specific gravity is,

however, presumably determined on the raw and vulcanized rubbers at room temperatures, whereas Mr. Sanderson's measurements of expansion have been taken at the temperature of vulcanization. The difficulty as regards the increased specific gravity of vulcanized rubber can probably be explained by assuming that vulcanized rubber possesses a greater coefficient of temperature expansion than raw rubber so that although a given weight of vulcanized rubber may occupy a larger volume than that of raw rubber at the vulcanizing temperature, it may occupy a smaller volume at room temperature.

I therefore suggest that, to make the matter clear, Mr. Sanderson should amplify Conclusion 5, by stating definitely what he means by the point of vulcanization; and Conclusion 6 also may require modification unless it can be shown that the specific gravity of vulcanized rubber is greater than that of raw rubber at the temperature at which vulcanization is taking place.

HENRY P. STEVENS.

15 Boro', London Bridge, S. E. 1.

SANDERSON'S REPLY.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Dr. Stevens' points are well taken, but I believe his objections will be met if I make my meaning clearer.

- (1) The phrase, "point of vulcanization" was perhaps an unfortunate expression to have used. I think everyone will agree that vulcanization does take place gradually and my experiments bear this out by showing that there were no breaks in the curves. By "point of vulcanization" I simply meant to describe that region of vulcanization to which rubber is cured in ordinary practice.
- (2) In discussing the changes in specific gravity I simply attempted to prove that the increase was due to the external pressure which is applied during the cure. I did this by comparing the results obtained under different degrees of external pressure. Samples cured with low external pressure showed almost no increase in specific gravity, while those cured with high external pressure showed considerable increase in specific gravity.

C. W. SANDERSON.

THE EDITOR'S BOOK TABLE.

"A TABLE OF TENSILE STRENGTHS OF RUBBER. BY HENRY W. JACOBSEN and JOSEPH E. PARTENHEIMER, 1919. Printed for the Fisk Rubber Co., Chicopee Falls, Massachusetts.

THIS publication consists of a series of tables arranged for ascertaining the tensile strength of rubber test pieces. The information sought is tabulated under the dimensions of the cross-section of the test piece arranged at the top of the table, with observed pounds' pull registered at the breaking point recorded at the side. This compilation will be found very convenient in eliminating calculations in testing laboratories where the routine calls for many tensile tests and quick information as to the results.

"THE METRIC FALLACY." BY FREDERICK A. HALSEY. THE American Institute of Weights and Measures, New York, 1919. (Cloth, octavo, 214, by 6 inches, 229, + 10 pages.)

Mr. Halsey's plea against the general adoption of the metric system appears, after fifteen years, in a second, revised edition, brought up to date, several chapters by Samuel S. Dale having been added.

"INORGANIC CHEMICAL SYNONYMS AND OTHER USEFUL Chemical Data." By ELTON R. DORRING, New York. D. Van Nostrand, 1919. (Cloth, 41, by 7 inches, 160 pages.)

This book is the outcome of a series of articles dealing with the subject which appeared in "The Chemical Engineer" in 1918. It is prepared for the use of students, but will be found a convenience by the experienced chemist. About one-third of the book is taken up by various useful tables of data concerning the elements, specific gravity, temperature comparison, and standards

of weights and measures. The remaining pages are devoted to lists of chemical synonyms in chapters arranged alphabetically by elements, each list being preceded by a brief account of the element, including its discovery and leading characteristics.

The book concludes with a cross-index of chemical names as an aid in finding true chemical names and other synonyms associated with them.

"INDUSTRIAL CHEMISTRY." A MANUAL FOR THE STUDENT and Manufacturer. Edited by ALLEN ROGERS. Third Edition, 1920. D. Van Nostrand, New York. (Cloth, 6 by 9 inches, 1232 pages.)

The third revised edition of this standard work on industrial chemistry appears after an interval of five years since the publication of the second edition. It has been enlarged by over two hundred pages and seventy new cuts.

The chapter on rubber has been enlarged by the inclusion of new matter in nearly every section, although an exhaustive treatment of the subject is not attempted. The chapter closes with two pages of bibliography which includes references to certain important legal decisions in causes relating to rubber-working processes and products. The references to the literature of rubber are extremely few. No mention is made, under periodical literature, of the leading rubber journals of America, England, France, or Germany, all of which are important in the industrial field.

NEW TRADE PUBLICATIONS.

GUTTA PERCHA & RUBBER, LIMITED, TORONTO, CANADA, ISSUED its price list of "Maltese Cross" rubber footwear on March 1 for the season of 1920-21. Coincident therewith appeared an attractive 64-page illustrated catalog numbered S-24, showing the company's latest styles in boots, lumbermen's arctics, excluders, overs, slippers and footholds. It comprises a varied and interesting line of attractive appearance and well-known quality.

"THE THERMOID NEWS" IS THE TITLE OF A VERY NEAT SEMI-MONTHLY factory paper published by the Thermoïd Rubber Co., Trenton, New Jersey, for the benefit of its employees. It is full of helpful hints, practical talks on trade topics, and entertaining chats about the staff and operatives in the big Trenton plant. Chester A. Charles is editor, assisted by Fred Birkholtz, Harry W. Seafoss, E. W. Craft, Richard A. Kirk and P. Krier.

THE HABIRSHAW ELECTRIC CABLE CO., NEW YORK CITY, HAS issued a 16-page illustrated pamphlet entitled "1650," outlining succinctly and entertainingly the development of insulated wires and cables from Guericke's first experiment in 1650 to the present day. Incidentally some very interesting facts about the great Habirshaw industry are presented, together with several views about the firm's plant at Yonkers, New York.

THE CHICAGO CHEMICAL BULLETIN, PUBLISHED MONTHLY by the Chicago Section of the American Chemical Society, has issued a pamphlet of 11 pages entitled "Chemists' First-Aid Treatment," by Paul Nicholas Leech. The emergency treatment of burns, abrasions, and bruises, and of internal conditions are treated briefly but adequately. There are also addenda from the "Handbook of Therapy" on poisons.

THE MOTOR & ACCESSORY MANUFACTURERS' ASSOCIATION ISSUES under the title, "The Triumph of Team-Work," a handsome pamphlet containing letters from many firms, praising the work of the association.

L. E. KNOTT APPARATUS CO., BOSTON, MASSACHUSETTS, IN their Catalog 24C present a valuable descriptive list of chemical and biological apparatus, the former of which are of interest to rubber chemists.

THE BUFFALO FOUNDRY & MACHINE CO., BUFFALO, NEW YORK, has selected a landscape of unusual beauty and brilliancy of color, Thomas Moran's "Castle in Old Mexico, Built During the Days of Maximilian," to decorate its calendar for 1920. The picture,

17 by 25 inches in size, is finely reproduced and an ornament to any office.

AN INTERESTING WALL MAP ISSUED BY THE RUBBER ASSOCIATION OF AMERICA, Inc., shows at a glance the location of each industry that is represented by members of the Association. The spots are crowded thickly in Massachusetts, Connecticut, New Jersey and Ohio; they make a good showing, too, in Rhode Island, Pennsylvania and Indiana. There are fourteen west of the Mississippi and five in Canada.

"The Hex," A MONTHLY HOUSE-ORGAN CONSISTING OF EIGHT pages, 12 by 14½ inches, is being issued by The Black & Decker Manufacturing Co., Towson Heights, Baltimore. The name is derived from the trade-mark of the concern which represents a hexagonal seal bearing the company's name. Each issue contains news of interest from the several departments of the organization and is illustrated with photographs and sketches.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(796.) An inquiry has been received for the addresses of rubber manufacturers who make tubes which can be inflated and contracted vertically, each inside measurement of the container.

(797.) Inquiry is made as to the address of the present manufacturer of the Schirm dipping machine.

(798.) Request is made for standard inner tube specifications.

(799.) A subscriber asks where he can purchase pontianak resin.

(800.) An inquiry has been received as to where a sewing machine for stitching on tire shoes can be obtained.

(801.) A rubber manufacturer desires late information and formulas for making dipped and molded goods.

(802.) A request is made for the address of some rubber company that will make a few sample semi-solid rubber tires, the inquirer having his own mold.

(803.) Inquiry is made for the addresses of manufacturers of gutta percha tissue, for use by piano-player action manufacturers.

(804.) A reader asks information concerning "Azijnzuur," used for coagulating rubber on plantations.

(805.) A manufacturer requests information as to where he can obtain a machine for rolling finger cots.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following District or cooperative offices. Requests for each address should be on a separate sheet, and state number.

DISTRICT OFFICES.
New York: 734 Customhouse.
Boston: 1801 Customhouse.
Chicago: 504 Federal Building.
St. Louis: 402 Third National Bank Building.

Portland, Oregon: Chamber of Commerce.
Dayton, Ohio: Dayton Chamber of Commerce.]

(File No. FE-114.) A firm in Singapore wishes to get in touch with American firms interested in rubber, gutta percha, jelutong and other products.

(34,401.) A company in Egypt wishes to buy tires and accessories. Quote f. o. b. New York. Payment in United States currency; confirmed credit in New York bank.

(34,402.) A merchant in Canada wants to secure a distributing agency for automobiles and tires. Quote f. o. b. Canadian destination. Payment cash.

(32,413.) A man in Algeria wishes to secure an agency for the sale of automobiles and tires. Quote c. i. f. Algeria. Payment against documents. Correspondence may be in English.

(32,437.) Several firms in Syria wish to be put in communication with manufacturers and exporters of rubber goods.

(32,458.) General importers and exporters in Syria desire to be placed in touch with manufacturers and exporters of rubber goods.

(32,473.) A firm of engineers and contractors in Siberia wishes to get in touch with manufacturers and exporters to secure agencies for rubber goods for industrial purposes. Correspondence may be in English.

(32,476.) Firms in Syria wish to enter into relations for the purchase of rubber goods.

(32,502.) A commercial firm in Turkey desires to secure an agency for the sale of rubber overshoes. Quotations c. i. f. Turkish port. Correspondence may be in English.

(32,561.) American representative of firms in China wishes to get in touch with exporters for the sale of rubber-plantation machinery.

JUDICIAL DECISIONS.

FACTS IN THE SCHRADER CASE.

THE CASE OF A. Schrader's Son, Inc., maker of tire valves, charged with violation of the Sherman Anti-trust Act, has so far been a contest on legal technicalities and not on the merits of the case. The decision of the Supreme Court, at the beginning of April last, remands the case for trial to the District Court of the Northern District of Ohio. The Schrader company was indicted about the time that the Colgate soap company was put on trial for conspiracy under the Sherman Law. It was averred that in selling their tire valves, valve parts and other tire accessories to wholesalers, they themselves fixing the prices at which they should be sold and declaring that they would not sell to anyone who did not accept their terms, violated the law. The company demurred to the indictment but the District Court overruled this and the case came up again in September last, the Schrader company expecting to contest it on the facts in the case.

On June 2, 1919, however, the Supreme Court gave its decision on the Colgate case (United States Reports, Volume 250, page 301), Justice McReynolds reading the decision. District Judge Westenhaver thought the two cases were similar and had the Schrader case argued again on the demurrer. He stated in his decision that he believed the Supreme Court had held in the Colgate case that a manufacturer could choose his own customers and announce in advance that he would only deal with such as maintained his prices. The only difference he could see in the Schrader case was that the prices appeared in a written license agreement which was signed by the tire-makers and jobbers. He consequently allowed the demurrer and dismissed the indictment.

From Judge Westenhaver's decision the Government appealed to the Supreme Court which, on April 2, through Justice McReynolds, overruled the demurrer and sent the case back to the District Court to have the indictment tried. In the course of his decision, he intimated that there was a difference between the Schrader and the Colgate cases, and that the written agreement in the former's mode of business, constituted a violation of the law. That matter must be settled, however, in the trial which is to come.

RUBBER IMPORTERS LIMITED, to deal in crude rubber, has been incorporated in Singapore by the Rubber Importers & Dealers Co., Inc., New York City, which has had its own offices in Singapore for some time.

DIAMOND FIBER FOR RUBBER WORKING EQUIPMENT.

THE HARD, TOUGH, HOMOGENEOUS MATERIAL with texture closely resembling horn, known as "fiber," is made from cotton cellulose, chemically hydrated. This product has remarkable properties and is being utilized by manufacturers everywhere in a great variety of products. Somewhat as in the case of rubber, new uses for it are daily being discovered.

Among rubber manufacturers fiber is being used for making such equipment as inner tube trays, bulb trays, books, boards, barrels, compound boxes and trucks. For all these purposes it is practically indestructible and for many other uses it is superior and less expensive than steel, brass, iron, tin, wood, vulcanite or leather. It is impervious to oil, grease or ordinary

STANDARD RUBBER BULB TRAY.

organic solvents, is unaffected by severe vibration, and may be worked into almost every conceivable form just as metals are machined. It cannot, however, be molded. Its tensile strength varies from 12,000 to 15,000 pounds per square inch and its resistance to compression, about 30,000 pounds per square inch. Its dielectric strength is approximately 200 volts per millimeter of thickness. The color incorporated in the material is permanent, the natural colors being gray, black and dark red, and the usual forms are sheets, rods and tubes, also special forms such as gears, bushings, washers, etc.

SHEET STOCK SEASONING BOOKS.

Fiber is especially adapted to use in rubber manufacturing because it eliminates all risk of damage to the uncured rubber by its freedom from splinters or roughness since fiber does not dent, split or crack and has a smooth, polished surface.

Another hydrolized cellulose fiber product of much interest to

rubber manufacturers is that known as rubber parchmoid. This is a substitute for holland cloth at a cost of about 60 per cent less. It is strong and pliable with highly finished surface to which rubber will not adhere. It is water, air and oil proof and is especially suited as a wrapper for raw rubber.

The accompanying illustration shows a standard fiber bulb

RUBBER COMPOUND BOX.

tray in which impressions are made of the same shape as the uncured bulbs. A fiber angle frame is fastened around the bulb holder. This frame is made flat on top and bottom so that the frames can be stacked when not in use. Trays are usually made to hold 72 bulbs. Powdered soapstone is not necessary in using these trays.

Fiber seasoning books are made in dimensions as required. They are constructed with 1/16-inch fiber bottom. The wood frame is completely covered with fiber angles and reinforced with iron corner castings. There is a special construction for holding the leaves in place, and new leaves can be put in the book in less than three minutes. One type of book is specially designed for use in rubber footwear factories.

INNER TUBE SEASONING TRAY.

Fiber compound boxes are made extra strong to withstand hard usage in rubber mills. Fiber not less than .090 to .100-inch in thickness is used. The moldings are covered with metal and the corners protected with heavy steel castings. Snugly fitting joints prevent leakage or sifting of the contents and there are no projections to catch particles of the contents when the compound is dumped into the mixer. The boxes being slightly tapered can be nested when not in use; 24 by 18 by 12 inches is the standard size for compound boxes.

Inner tube trays have fiber bottoms with fiber angles securely riveted to the bottom. The flat, smooth heads of the rivets are on the inside of the tray. Two-inch hardwood molding covered with metal is used, with iron castings on the corners. These trays cannot splinter because there is no exposed wood and therefore the rubber tube is protected from puncture or injury. The usual dimensions of inner tube trays are 2 inches deep by 16 inches wide by 120 inches long.

THE DEPARTMENT OF AGRICULTURE ANNOUNCES THAT AFTER February 16, 1920, persons requesting the classification and certification of cotton, according to the Cotton Futures Act as amended by the Act of March 4, 1919, shall pay a fee of forty cents per bale.

Annual Report of the United States Rubber Co.

THE TWENTY-EIGHTH ANNUAL REPORT of the United States Rubber Co., presented at the annual meeting April 20, 1920, showed a gratifying business for the calendar year 1919. Net sales amounted to \$225,589,465, an increase of almost \$10,000,000 over 1918, the latter year including a large volume of business incident to the war. The net income before interest, but after providing for depreciation of plants and adequate reserves for Federal, Canadian and British taxes on income and profits, amounted to \$21,396,099. Deducting \$3,665,862 for interest charges leaves a net profit of \$17,730,237. From this there remained to be deducted \$5,041,476 for dividends on preferred stock, \$19,567 for dividends on minority stock of subsidiaries, \$720,000 for dividend on common stock paid October 31, 1919, and \$1,378,576 for reserve for dividend on common stock payable January 31, 1920, leaving a balance for the year of \$10,570,618 to be carried to surplus account. The surplus at the beginning of the year amounted to \$41,848,051, from which \$108,506 was deducted for adjustments made during the year, making the surplus as of December 31, 1919, \$52,310,163.

The financial condition of the company, according to Chairman Colt, "was never better than it is to-day." Expanding business and advancing costs will in time require more capital. Sales so far this year "show a substantial increase over last year," and with the completion of new plant facilities, notably in the tire division, sales and profits, he believes, should be larger for 1920 than they were in 1919.

THE CHAIRMAN'S REPORT.

To the Stockholders of the United States Rubber Co.:

In compliance with the by-laws of the company, the chairman of the board of directors submits to the stockholders this annual report for the fiscal year ended December 31, 1919.

The financial statement, as compiled by the comptroller and certified by the public accountants, is appended hereto and made a part hereof. This statement gives a consolidated general balance sheet as of December 31, 1919, of the United States Rubber Co. and its subsidiaries, after excluding all offsetting accounts between the companies.

VOLUME OF BUSINESS AND PROFITS.

The net sales of the company for the year 1919 were \$225,589,465, an increase of more than \$10,000,000 over the sales of the previous year, which latter included a large volume of business incident to the war. This war business in 1918 was \$25,000,000 greater than in 1919.

The net income before interest, but after making provision for depreciation of plants and adequate reserves for Federal, Canadian and British taxes on income and profits, amounted to \$21,396,099.

The net interest charges amounted to \$3,665,862.

Thus leaving net profits for the year, \$17,730,237.

The dividends on United States Rubber Co. preferred stocks amounted to \$5,041,476.

The dividends on minority stock of subsidiary companies amounted to \$19,567.

Making a total of \$5,061,043.

Leaving surplus for the year applicable to the common stock, \$12,669,194.

From which there was deducted:

Dividend on common stock paid October 31, 1919 \$720,000.

Reserve for dividend on common stock payable January 31, 1920, 1,378,576.

Making a total for common stock dividends, 2,098,576.

Leaving balance for the year carried to surplus account, \$10,570,618.

The surplus at the beginning of the year amounted to \$41,848,051.

From which there was deducted for adjustments made during the year, 108,506.

Thus leaving \$52,310,163.

Making the surplus as of December 31, 1919, \$52,310,163.

AMENDMENT OF CHARTER.

At a special meeting of our stockholders held September 9, 1919, it was voted to increase the authorized first preferred

stock from \$70,000,000 to \$100,000,000 and the authorized common stock from \$40,000,000 to \$200,000,000, and to retire the small remaining balance of second preferred stock, thus simplifying the capitalization of the company and providing the opportunity for future financing through the issuance of common stock when the same seems desirable.

INCREASE IN THE COMMON STOCK.

Pursuant to such action of the stockholders, an offering of our common stock of 100 per cent, or \$36,000,000, was made at par, pro rata, to our common stockholders of record September 13, 1919, subscriptions being payable October 1, 1919, or in four instalments, at the election of the stockholder. All of the stock so offered was subscribed for by the stockholders, a very large percentage of stockholders electing to pay in full on October 1, and the company received, as of that date, \$33,683,450, and the balance of \$2,316,550 was thereafter paid in instalments as provided. The company, however, had the use of this money for but three months of the year, and a considerable amount was held to liquidate short time maturing obligations.

STOCK CARRIED FOR EMPLOYEES.

With a view to increasing the zeal and efficiency of the employees of the company, by encouraging them to have direct personal interest in its success, your directors have from time to time provided through a "Stock Subscription and Profit Sharing Plan," a "Value Sharing Plan," and options on stock in certain special cases, for such employees to acquire such stock by carrying it for them for certain periods, over 4,500 employees being included this year in such plans. Your chairman cannot but feel that the enthusiasm and earnestness which such personal interest has engendered has had much to do with the unusual growth of our business and profits.

When the common stock was doubled in amount, the company through a subsidiary acquired and agreed to carry for not exceeding five years the additional amounts to which such employees were entitled to subscribe with respect to stock received by them or carried for them under such plans.

DIVIDENDS UPON COMMON STOCK.

In October, 1919, your directors placed our common stock upon an 8 per cent dividend basis, believing that they were amply warranted in so doing, and the earnings of the year together with the future outlook of business, would indicate that such action was conservative.

On January 8, 1920, the board of directors voted to distribute \$9,000,000 of the surplus of the company, as a stock dividend of 12½ per cent, to common stockholders of record February 5, 1920.

It will be noted that the surplus of the year 1919 itself was sufficient to cover this stock dividend as well as the cash dividends paid.

INVENTORIES.

Inventories of manufactured goods and materials have been taken at cost where cost was below market, and at market where the market was below cost. The market today is generally above cost.

MAINTENANCE OF PLANTS.

The plants and properties of the company have been maintained as heretofore in the highest state of efficiency, and adequate reserves have been made for possible depreciation by charges against current earnings.

EXPANSION OF PLANTS.

In order to provide for the constant and rapidly increasing demand for its product of automobile truck and passenger car tires, the company commenced in the early part of 1919 a substantial expansion of its tire manufacturing plants both in the United States and in Canada. This expansion includes important developments at each of the company's five tire plants, and it is confidently expected that these improvements will more than double the productive capacity of the tire plants by the early part of next year.

All expansions and improvements have been made with a view to effecting every economy in manufacture and at the same time to maintaining the highest possible quality of the product.

SINKING FUND FOR RETIREMENT OF BONDS.

Pursuant to the requirements of the indenture securing the company's first and refunding mortgage 5 per cent gold bonds,

\$690,000, being 1 per cent of the total amount of bonds issued, was paid to the sinking fund trustees on January 1, 1919.

The call for tenders resulted in the purchase of bonds to the par value of \$793,000, and these bonds have been retired and the bonded indebtedness reduced by a like amount.

UNITED STATES RUBBER EXPORT CO., LIMITED.

The export sales of the company have increased over the previous year.

Adverse exchange conditions prevailing in some of our foreign markets were successfully met and a satisfactory profit maintained.

Your directors, realizing the value of export markets as a stabilizing factor and the importance of such an outlet, are continuing the policy referred to in the last annual report of maintaining and materially extending our export business.

GENERAL RUBBER CO.

Since 1904 this subsidiary has protected our requirements (now including our Canadian company) of crude rubber in a most satisfactory manner. On January 1, 1920, the name of their London branch, William Symington & Co., Limited, was changed to "General Rubber Co., Ltd." The General Rubber Co. now directly or through its subsidiaries entirely owns and operates our houses at London, Liverpool, Singapore, Colombo, Pará and Manaoas. This efficient organization has been recognized by others to such an extent that outside dealers and manufacturers are entrusting to it a large portion of their orders.

RUBBER PLANTATIONS.

During the year 1919 the production of our plantations in Sumatra has shown a good increase over previous years due largely to the growth of the trees. It is our intention to continue the extension policy as rapidly as possible in order that eventually a much larger percentage of the rubber consumed by our factories may be obtained from our own plantations, and in connection with this it should be borne in mind that our consumption of crude rubber greatly increases from year to year. In this extension program, the company is not confining itself to Sumatra, which is under the government of Holland, but planted properties and areas suitable for planting already have been acquired in other territories, principally on the Malay Peninsula, which is under the British Government.

As stated in my report for 1918, the management of the present properties and the new areas being acquired and developed are under the direct control of the United States Rubber Plantations, Incorporated, the subsidiaries of which at December 31, 1919, were the Holland American Plantage Maatschappij, Si Pare Pare Rubber Maatschappij and Nederland Langkat Rubber Maatschappij, which together own over 90,000 acres in Sumatra, the planted area of which is over four times the size of any other American owned plantation and is the largest unit of rubber planted area in the world.

OUTLOOK FOR 1920.

The sales of the company so far this year show a substantial increase over last year. With the completion of our new construction now in process, notably in the tire division, our sales and profits for 1920 should be larger than they were in 1919.

GENERAL FINANCIAL CONDITION.

The financial condition of the company was never better than it is to-day. However, its expanding business, outlays for new construction to meet the same, and also the advancing cost of practically all materials entering into our manufactured product (with the one exception of crude rubber), will in time require more working capital.

FINAL.

I am pleased to make mention of the continued fidelity and ability shown by the officers, heads of departments, our Far Eastern and foreign staffs, and other employees of the company and its subsidiaries.

Respectfully submitted,

SAMUEL P. COLT, Chairman.

THE BUNSEN BURNER IN RUBBER REPAIR.

By Arthur C. Squires

EVERY RUBBER MAN knows that melting rubber spoils it; whether the rubber is vulcanized or not, but, like many other rules conserving rubber, there are exceptions. A well-known case in point is the sticking of the iron shafts into rubber wringer rolls. This has been done successfully for years by heating the shaft red hot and forcing it through the rubber roll. The hot iron melts the rubber that it comes in contact with and forms a tenacious film that is tremendously adhesive. Indeed, it is one of the strongest bindings known.

Along the same line is the melting of a vulcanized rubber surface for patching. This has also been done with a hot iron, but

PREPARING A TIRE FOR RETREADING BY THE BLUE-FLAME PROCESS.

a better way is to use a controlled blue flame; for this the Bunsen burner or blow-torch is ideal. A quick searing of a rubber surface—being careful not to scorch the fabric—effects a semi-devulcanization of the rubber surface and melts some of the rubber. A patch cemented on this never lets go. Hot water bottles, which are most difficult of repair, respond to this method better than to any other. So, too, inner tubes are exceedingly well mended by the blue-flame method. The applicability of it to auto tires has also quite lately been thoroughly demonstrated. Even auto tires which have been worn down nearly to the fabric of the carcass are being successfully semi-devulcanized and retreaded by this new method.

It is not necessary to file, roughen or clean the worn parts of a tire, as has been customary. The blue flame removes all foreign matter, sulphur bloom, and moisture, leaving a clean, sticky surface. This is covered with a solution consisting of 5 per cent pure rubber dissolved in 95 per cent of carbon tetrachloride or benzol and given time to dry.

A new tread is best constructed by applying 2-inch-wide strips of unvulcanized tread stock to the sticky tread surface and stitching the strip smooth and fast all around the face of the tire. The new tread is formed of strips of semi-devulcanized stock cut to the desired width and thickness of the tread, superposed and stuck fast on the unvulcanized strip. Next a strip of unvulcanized tread stock cut wide enough to cover and overlap the built up tread completely around the circumference of the tire completes the assembly that is now ready to be cured in a sectional vulcanizer or retreading mold.

A complete new tread built on a tire $4\frac{1}{2}$ by 35 inches requires $2\frac{1}{2}$ pounds of new unvulcanized stock and $7\frac{1}{2}$ pounds of vulcanized tire strippings. The weight of the retread stock used in retreading a tire should be known. This fact can be ascertained by vulcanizing a foot length of standard retreading stock in the mold free from contact with the tire.

The semi-vulcanized stock mentioned is thus prepared. Tread strippings from worn tires are cut to the proper width and the

surface treated with the flame of the burner. The vulcanized rubber is semi-devulcanized and its surface rendered very sticky. After it is applied as a new tread and vulcanized it forms a very tenacious and durable stock at a small cost.

ALUMINUM IN THE RUBBER INDUSTRY.

STEEL AND IRON MANDRELS, molds and cores have been and still are very generally used in many branches of the rubber industry. Similarly maple forms or lasts have been the rule in the manufacture of rubber boots and overshoes. Steel, iron and wood leave much to be desired in the way of adaptability, though from differing causes.

Mandrels, molds and cores are not only heavy to handle, but used in connection with the process of vulcanization are more or less seriously subjected to rusting and pitting, thus transferring rough and discolored surfaces to the rubber cured in contact with these defects.

Boot trees and lasts for large overshoes where made of maple wood are subject to deterioration by the heat of vulcanization and undergo a slow carbonization with the result that when continuously handled, as they are, the sharp angles wear away rapidly, thus changing the form and fit of the goods made upon them.

These defects have been very completely removed by the introduction of aluminum alloy to replace steel, iron and wood, particularly for the places indicated. A few facts with regard to aluminum will be of interest in this connection.

INNER TUBE MANDRELS AND CORES.

In the first place sulphur has no effect on it at all; further, it is light, having little more than one-third the weight of iron. This is important for the men who handle the mandrels. A two-inch aluminum tube ten gage and ten feet long will weigh about nine pounds, while the same mandrel in iron will weigh twenty-six. This makes considerable difference in the speed with which the mandrel can be handled. The illustration shows a couple of tube mandrels used in an English tire factory and in accordance with their usual practice they are curved to the form of the tire. Still it is found that the rubber tube is quite easily peeled off.

ALUMINUM MANDRELS

Aluminum cores are also used for outer covers, but in the shape of a closed circle the joint in the metal being carefully welded. Tube mandrels are, of course, made of smaller tube in straight lengths, but whereas a steel one will weigh a hundred pounds the same apparatus in aluminum will only weigh thirty.

LABELS FOR BRANDING HOSE, TIRES, ETC.

Aluminum can be rolled very thin, in fact, nearly as thin as gold, and there is a great demand for strip about ten one-thousandths of an inch thick for brands. When a pattern or lettering has to be stamped on a rubber hose or tire it is, of course, necessary to interpose a thin strip of metal bearing the lettering or design to be impressed in the rubber. Some rubber manufacturers use tin for this purpose, but tin is more than three times as heavy, and although it costs more to the pound, aluminum is at least seventy-five per cent cheaper, because of the greater area due to its lesser gravity.

ALUMINUM TIRES AND LASTS.

Rubber boots and overshoes are now made on aluminum lasts of a special alloy devised by a British company for this purpose. This metal pours freely into the mold, and is strong and easily

polished. The same metal can be applied to make the various molds used for other purposes in the rubber trade, etc.

The cast metal withstands heavy pressures employed in molding and as it polishes perfectly imparts a lustrous finish to the molded goods.

ALUMINUM ON THE RUBBER PLANTATION.

In the gathering and preparation of rubber latex a great variety of utensils is necessary. It is here that aluminum has found ready adaptability for its lightness and resistance to corrosion. Latex cups and spouts, collecting pails and coagulating pans, are a few of the aluminum accessories in daily use on a rubber plantation.

ALUMINUM LATEX UTENSILS.

EMERGENCY REPAIRS ON BALLOONS.

When an Army balloon in use is ripped, the soldier aeronauts do not nowadays exhaust the big rubberized silk bag of its gas in order to mend the rent. They have found that by swift, well-directed work such damage can be corrected

readily on a filled balloon, and with a minimum loss of gas and time. As soon as the balloon breaks or is torn by contact with a tree, pole, chimney or other object, a hurry call is given and soon a crowd of soldiers surround and seize the big gas bag. By tugging at the ropes holding the basket they maneuver the balloon until the gaping part is turned under-

REPAIRING BALLOON, ROSS FIELD, CALIFORNIA.

neath. The object of this is to save the hydrogen; for with the ripped side up the lighter-than-air gas soon escapes. Even when the torn part is below, there is much leakage, and, what is also objectionable, there is an admission of air, which if allowed to continue far, lessens the buoyancy and often necessitates refilling.

While the gas bag is thus held captive the repairers pull the torn flaps together and hold them while others sew the torn section with a baseball stitch of stout linen thread. At the same time others prepare the cement of pure Pará rubber dissolved in naphtha, while others cut a patch of balloon material slightly larger than the torn part. The cement having been brushed on the patch and torn surface, the patch is applied and rolled down thoroughly with a hand roller. In a few minutes it is dry and the balloon ready for use again.

A disadvantage of the emergency repair is, that a patch can be put on one side (the outer) only, and the rolling has to be done against a yielding, cushion-like surface; although

very good results are obtained by the resistance afforded by the distended bag, which is ordinarily inflated with about 18 pounds' pressure.

When time can be taken for a job the balloon is turned inside out and laid flat. Then a patch is applied on each side of the stitched part, the rolling is done against a hard, smooth surface, and the result is a bag that for all practical purposes is as good as new. The cement used in the slower and more thorough operation is the same as used in the hasty repair work.

PNEUMATIC TIRES FOR PACKARD TRUCKS.

A new line of pneumatic-tired trucks has been put on the market by the Packard Motor Car Co. of Detroit, in order to meet the demand for greater speed and wider expansion of transportation by motor trucks. The necessary gear ratios and machinery details have been carefully studied out. Demountable rim equipment is provided so as to make it easier to handle the giant size tires. The use of metal wheels of the spoke type renders it possible to employ a slot in the rim for the valve stem and thus enable the tire to be assembled on the wheel by rolling it into position and then sliding it over the wheel, instead of lifting tire and rim assembly so as to insert the valve stem through a hole in the rim, as is the practice with small, light tires.

The trucks are made in 1½-ton, 2-ton and 3-ton sizes, full details of each being given in the company's circular. The sizes of tires, all single pneumatic, are, for the 1½-ton trucks—front 36 by 6, rear 38 by 7; for the 2-ton trucks—front 36 by 6, rear 40 by 8; for the 3-ton trucks—front 38 by 7, rear 44 by 10. Just four sizes of tires are used.

FIFTY MILLION SMALL TIRES?

"The smallest automobile in earth" as far as we know is shown in the above picture. This little car was built by Fritz Reuter, of San Antonio, Texas, who operates a large automobile machine shop. He built the car of odds and ends from Fords to Pierce-Arrows.

This clever little piece of handiwork is run by electric motor and storage battery and is the result of one and one-half years

THE SMALLEST AUTOMOBILE.

of work during spare moments. The figure on the back of the car is a statuette of the widely known "Time to Re-tire" boy of The Fisk Rubber Co.

Ten million six-year-olds equipped with these Lilliputian cars would use 50,000,000 tires. Added to what the grown-ups require it means a rubber shortage by 1925.

News of the American Rubber Industry.

FINANCIAL NOTES.

THE B. F. Goodrich Co. has issued \$30,000,000 in four-year seven per cent convertible gold notes, due April 1, 1925, that at 98½ and accrued interest will yield more than 7.40 per cent. These notes carry detachable warrants giving holders a call on common stock at \$80 a share.

The Fisk Rubber Co. for the year ended Dec. 31, 1919, shows surplus after federal taxes of \$3,994,657, equivalent after preferred dividends to \$5.99 a share (\$25 par) against \$2,506,853 or \$19.50 (\$100 par) earned on \$8,000,000 common stock in 1918. Net sales in 1919 were \$43,613,975. Income account compares:

	1919.	1918.	1917.
Net profits	\$4,956,683	\$3,760,279	\$3,578,484
Federal taxes	962,028	1,253,426	549,913
Balance	3,994,657	2,506,853	3,028,572
Preferred dividends	1,055,489	946,750	972,850
Deduction	835,949	989,659	475,685
Surplus	2,104,118	970,444	1,580,037

*Retirement preferred stock.

Stockholders of the Hood Rubber Co. voted to increase the authorized common stock of the company from \$3,500,000 (of which \$3,000,000 is outstanding) to \$5,500,000. The \$2,000,000 additional stock will be distributed as a stock dividend, to common stockholders of record April 10, in proportion of two new shares for every three shares now owned.

The Miller Rubber Co.'s sales for March, 1920, totalled \$3,600,000, according to the company's report. Total sales for 1919 were \$26,475,211, an increase of nearly \$11,000,000 over the previous year. At the present rate the sales total for 1920 will be \$50,000,000. Capitalization of the company was recently increased to \$60,000,000 to care for an oversold condition.

DIVIDENDS.

The American Zinc, Lead & Smelting Co., St. Louis, Missouri, and New York City, has declared a dividend of \$1.50 per share, payable May 1 on preferred stock of record April 15, 1920.

The Ames Holden McCready System, Montreal, Quebec, declared a quarterly dividend of one and three-quarters per cent, payable April 2 on preferred stock of record March 19, 1920.

The Canadian-Connecticut Cotton Mills, Limited, New York City and Sherbrooke, Quebec, Canada, recently declared a two per cent quarterly dividend, payable April 1 on preferred stock of record March 20, 1920.

The Canadian General Electric Co., Limited, Toronto, Ontario, declared the following dividends: two per cent quarterly on common stock, two per cent extra, and three and one-half per cent semi-annual on preferred stock, all payable April 1 on stock of record March 13, 1920.

The Corn Products Refining Co., New York City, declared the following dividends: one per cent quarterly and one-half of one per cent extra, both on common stock, and one and three-quarters per cent quarterly on preferred stock, all payable April 20 on stock of record April 5, 1920.

The Dayton Rubber Manufacturing Co., Dayton, Ohio, declared a quarterly dividend of \$1.75 per share, payable April 1 on preferred stock of record March 20, 1920.

E. I. du Pont de Nemours & Co. (incorporated), Wilmington, Delaware, declared a quarterly dividend of one and one-half per cent, payable April 26 on stock of record April 10, 1920.

The First National Bank, Boston, Massachusetts, declared a quarterly dividend of four per cent and an extra dividend of one per cent, both payable April 1 on stock of record March 24.

The Globe Rubber Tire Manufacturing Co., Trenton, New Jersey, declared its regular quarterly dividend of one and one-half per cent and a stock dividend of ten per cent, both payable April 1, 1920.

The B. F. Goodrich Co., Akron, Ohio, has declared its regular quarterly dividend of \$1.50 per share, payable August 16 on common stock of record August 5, 1920.

The Goudy Gum Co., Boston, Massachusetts, declared a quarterly dividend of \$2 per share, payable April 1 on preferred stock of record March 27, 1920.

The Hood Rubber Co., Watertown, Massachusetts, has declared its regular quarterly dividend of one and three-quarters per cent, payable May 1 on preferred stock of record April 21, 1920.

The Kelly-Springfield Tire Co., New York City, has declared the following dividends: quarterly, cash \$1 per share and stock three per cent, payable May 1 on common stock of record April 17; quarterly, \$2 per share, payable May 15 on eight per cent preferred stock of record May 1, 1920.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has declared its regular quarterly dividend of one and three-quarters per cent on outstanding preferred stock.

The Monatikout Rubber Works Co., South Braintree, Massachusetts, declared a quarterly dividend of \$1.75 per share, payable April 1 on preferred stock of record March 23, 1920.

The Mutual Tire & Rubber Corporation, New York City, declared an initial dividend of one per cent, payable April 19 on stock of record March 27, 1920.

The Standard Tire Co., Willoughby, Ohio, recently declared initial quarterly dividends of one and three-quarters per cent on preferred stock and of one and one-half per cent on common stock payable April 1 on stock of record March 25, 1920.

The Sterling Tire Corporation, Rutherford, New Jersey, has declared the following dividends: one per cent annual on common stock, eight per cent on eight per cent preferred stock, series B, and one and three-quarters per cent quarterly on seven per cent preferred stock, all payable April 15 on stock of record April 1, 1920.

The Tyer Rubber Co., Andover, Massachusetts, has declared its regular quarterly dividend of \$1.50 per share, payable May 15, 1920, on preferred stock.

The United States Rubber Co., New York City, has declared quarterly dividends of two per cent on both common and preferred stock, payable April 30 on stock of record April 15, 1920.

The Winnsboro Mills, Winnsboro, South Carolina, declared a quarterly dividend of two per cent, payable April 1 on stock of record March 26, 1920.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, declared quarterly dividends of two per cent on its common and preferred stock, payable April 30 and April 15, respectively, on stock of record April 2, 1920.

LIBERTY BONDS A BETTER INVESTMENT THAN EVER.

Thrifty rubber workers are finding the present favorable market prices of Liberty Bonds a very profitable investment for their savings, and some of the large rubber companies are encouraging and assisting their operatives in the purchase of these securities. Owing to the great demand for \$50 and \$100

bonds the Treasury Department has issued instructions to the Federal Reserve Banks which will expedite the exchange of bonds of larger denominations for the small units. Ways and means are also provided whereby the smaller bonds may be obtained in the first instance.

NEW INCORPORATIONS.

Arterfat Tire Co., The, September 16, 1919 (Iowa), \$1,000,000. A. Smith, president; L. C. Merritt, vice-president; B. F. Kraft, secretary and treasurer. Principal office, Des Moines, Iowa. To manufacture, sell and deal in rubber goods.

Baldwin Tire Co., March 31, 1920 (New Jersey), \$100,000. H. M. Smith; K. M. Baldwin, both of 654 Clinton avenue; J. M. Baldwin, 27 Frelinghuysen avenue—both of Newark, New Jersey. Principal office, 27 Frelinghuysen avenue, Newark, New Jersey. Agent in charge, J. M. Baldwin. To manufacture, import, export, and buy automobile tires, supplies, etc.

Block Tire & Rubber Co., February 21, 1920 (Indiana), \$1,500,000. G. R. Wilson, president and treasurer; L. C. Zehring, vice-president; E. N. Ehr, secretary. Principal office, Lafayette, Indiana. To manufacture automobile tires and rubber goods.

Burlock Rubber Clothing Co., The, January 19, 1920 (Wisconsin), \$500,000. C. Burlock, president; F. E. Foster, secretary, both of 297 Third street, Milwaukee; J. Sell, vice-president, 1012 Washington street; E. I. Frazier, 112 Third street, both of Wausau, both in Wisconsin. Principal office, Wausau, Wisconsin. To manufacture, buy, sell, export, import and generally deal and trade in leather, rubber and gutta percha.

C. L. Tire Shop, Inc., April 20, 1920 (New York), \$35,000. J. B. and D. L. Cottrhan, both of 123 Hamilton avenue, New Rochelle; C. G. Low, Poughkeepsie, both in New York. Principal office, Poughkeepsie, New York. To manufacture auto tires.

Doyle Tire & Rubber Co., The, October 21, 1919 (Ohio), \$300,000. D. A. Doyle, Jr., president and treasurer; M. J. Sopy, vice-president; and sales manager; F. H. Kelsey, vice-president; A. W. Doyle, secretary. Principal office, Doyle Block, Akron, Ohio. To manufacture cord and fabric tires.

Enterprise Vulcanizing Co., Inc., April 16, 1920 (New York), \$10,000. A. and M. Herman, both of 205 Frost street; C. H. Paulsen, 462 Dean street—both in Brooklyn, New York. To do tire repair business, etc.

Everybody's Garter Co., Inc., April 20, 1920 (New York), \$10,000. J. Landau, 836 Broadway, New York City; C. Weintraub, 995 Eastern Parkway, Brooklyn; M. Landau, Floral Park, Long Island—all in New York. Principal office, Floral Park, New York. To manufacture suspenders, garters, etc.

Ford Tire & Rubber Co., April 5, 1920 (Delaware), \$3,000,000. F. R. Hansell; J. V. Pimm; E. M. MacFarland—all of Philadelphia, Pa. To manufacture tires.

Gillette Rubber Products Co., The, March 18, 1920 (West Virginia), \$600,000. D. L. McConaughy, A. M. Replage; S. Patterson, all of 928 Frick Building; C. O. Lind, 289 Union Avenue—both in Pittsburgh, Pennsylvania; T. S. Wilson, 19th and Prospect streets, Cleveland, Ohio. Principal office, Cleveland, Ohio. To manufacture automobile tires and other rubber products.

Gutta Percha Products Co., Inc., April 13, 1920 (New York), \$30,000. K. F. Wallin, 1512 Pacific street; B. McMillan, 15 Aberdeen street, both of Brooklyn; J. Bradley, 1029 Ogden avenue, New York City—both in New York. To manufacture and deal in rubber, gutta percha, etc.

Habirshaw Electric Cable Co., February 28, 1920 (Delaware), authorized capital \$1,350,000 preferred; 300,000 shares common, no par value. Principal office, 10 East 43rd street, New York City. Delaware agent, The Capital Trust Co. of Delaware. J. N. Shreve, president and treasurer; G. F. Waterbury, vice-president; J. S. Knish, secretary. To manufacture and sell insulated wires and cables and to hold stock of corporations engaged in a similar line of business.

Hennessy-Fennell Tire Co., November 15, 1919 (Iowa), \$10,000. F. D. Hennessy, president and treasurer; E. A. Brown, vice-president; T. F. Fennell, secretary. Principal office, northwest corner Eighth and Nebraska streets, Sioux City, Iowa. To rebuild and repair tires.

Imperial Rubber Co., The, March 27, 1920 (Ohio), \$25,000. F. T. Flinn, president; Ashland, S. S. Hobbs, vice-president, Oberlin; H. A. Finn, secretary and treasurer; H. H. Hoberg, general manager; F. L. Strauss—the latter three of Orrville; all in Ohio. Principal office, Orrville, Ohio. To manufacture rubber sundries and specialties.

Industrial Rubber Corp., April 9, 1920 (New York), \$100,000. L. Price, 894 Riverside Drive; N. Bolden, 305 West 148th street; E. L. Alexander, 385 Central Park West—all of New York City. Principal office, Long Island City, New York.

Jackson Tire & Rubber Co., April 5, 1920 (Delaware), \$7,925,000. T. L. Croteau; M. A. Bruce; S. E. Dill—all of Wilmington, Delaware.

Kentucky Tire Pump Co., October 11, 1919 (Kentucky), \$50,000. W. J. Ruby; H. H. Galt, P. H. Lewis, all of 200 North Main street, both of New York City; W. J. Bolter, 315 Lincoln avenue, Ryeville, Kentucky. Principal office, Madisonville, Kentucky. To manufacture automobile accessories.

Knickerbocker Rubber Co., Inc., April 13, 1920 (New York), \$25,000. Walter B. and Thomas E. McDonald, both of 6th St. and 12th Ave., New York City. Principal office, 415 Sixth street—both in Brooklyn, New York. To manufacture rubber tires, etc.

Leaven Patents, Inc., April 12, 1920 (New York), \$500. M. H. Behr, 12 East 57th street; H. J. Leaven, 200 West 20th street, both of New York City; W. J. Bolter, 315 Lincoln avenue, Ryeville, Kentucky. Principal office, both in New York City. To deal in patents, etc.

MacArthur & White, Inc., March 26, 1920 (New York), \$5,000. W. MacArthur, A. R. White, both of Akron, Ohio; A. Pargelow, 2653 Decatur avenue, Paulden, New York City. To manufacture rubber goods.

National Steam & Stencil Works, Inc., April 7, 1920 (New York), \$50,000. R. Conner, C. F. Conner, both of 425 Broadway street, Brooklyn; J. Engel, 1702 Woodbine street, Ridgewood—both in New York. To manufacture rubber stamps, stencils, checks, etc.

New York Tire Supply Co., March 26, 1920 (New York), \$250,000. S. and A. Jaffee, 216 West 45th street; J. Jaffee, 1 West 113th street, both in New York City. To do tire business.

Orester Tire Co., Inc., April 3, 1920 (New York), \$50,000. I. Orester, G. F. Scherer, C. J. Parker, all of Syracuse, New York. Principal office, Syracuse, New York. To conduct a tire business.

Rubber Crème Manufacturing Co., Inc., April 2, 1920 (New York), \$100,000. W. W. Lesselbaum, F. Druss, E. Eisenstein—all of 128 Broadway, New York City. Principal office, Queens, New York City. To manufacture rubber goods.

Scott Rubber Co., Inc., April 2, 1920 (New York), \$125,000. G. L. Kerr, 790 Riverside Drive; W. H. Palen, 18 East 28th street, both in New York City; H. B. E. Scott, 26 Cottage street, Poughkeepsie—both in New York. Principal office, Poughkeepsie, New York. To manufacture rubber goods, etc.

Sevell Cushion Wheel Co., April 5, 1920 (Delaware), \$1,000,000. T. L. Croteau; M. A. Bruce; S. E. Dill—all of Wilmington, Delaware. Head office, Detroit, Michigan.

Smith Rubber & Tire Co., April 14, 1920 (New York), \$50,000. E. B. McCaffrey; R. L. Gray; I. M. Jacobson—all of 1777 Broadway, New York City.

Synthetic Leather & Waterproofing Co., March 29, 1920 (Delaware), \$1,000,000. T. L. Croteau; M. A. Bruce; S. E. Dill—all of Wilmington, Delaware. To manufacture leather, imitation leather, belting, etc.

Tirometer Valve Corporation of America, September 30, 1919 (West Virginia), \$250,000. J. Collins, president; G. P. Daniels, first vice-president; I. Pulverman, second vice-president and general manager; S. A. Moore, secretary and treasurer; T. J. Walsh, sales manager. Principal office, Charleston, West Virginia. To manufacture the Pulverman Tirometer valve.

FIRESTONE'S EASTERN SALES MANAGER.

JOSEPH E. MAYL, eastern sales manager of the Firestone Tire & Rubber Co., Akron, Ohio, is a native of Dayton, Ohio, in which city he was born December 15, 1888. His education

was obtained in St. Mary's College, Dayton, and later in the University of Pennsylvania, Philadelphia.

Mr. Mayl began his business career with the Chalmers Motor Co. in June, 1909, and from September, 1910, until May, 1911, was with the Gordon Motor Co., Richmond, Virginia. On the latter date he came to the Firestone company as a salesman in the St. Louis, Missouri, branch and his advancement since that time has been rapid. In December, 1915, he was promoted to manager of the Memphis, Tennessee, branch and in May, 1917, was transferred to the same capacity to the Cleveland, Ohio, branch. December, 1918, found him New England district manager with headquarters in Boston, Massachusetts, and since January of the present year he has been eastern manager with headquarters in Akron, Ohio.

Obviously Mr. Mayl's record of achievement is still far from complete.

EUROPEAN FOOD DRAFTS.

Rubber companies are requested to inform their foreign-born employees concerning the plan of the American Relief Administration, 115 Broadway, New York City, of which Herbert Hoover is chairman, to facilitate the distribution of food in the European countries threatened with famine, by means of "food drafts." Those employees who are anxious to help their relatives in the home countries have been sending money, which is of little use, owing to the prohibitive price of food.

Food warehouses are now open at Hamburg for Germany, Warsaw for Poland, Vienna for Austria, Budapest for Hungary and Prague for Czechoslovakia, with branches in the principal towns. These depots will honor food drafts issued by American banks, and give out the food called for to the person to whom the draft is sent.

The plan is endorsed by the American Bankers' Association, the American Red Cross, the Y. W. C. A., and the Governments of the five countries involved. The food will be given out only at the warehouses and the buyer of the draft will be notified when the food has been delivered.

JOSEPH E. MAYL.

NEW PRESIDENT OF A. SCHRADER'S SON, INC.

CHARLES SCHWEINERT, the recently elected president of A. Schrader's Son, Inc., Brooklyn, New York, presents a notable instance of that constant advancement through long and faithful service which has been one of the chief bulwarks of success in American industry. Thirty-four years ago he entered the employ of the company in the capacity of office boy, and has ever since been associated with the growth and development of the concern from a small three-story factory in New York to the present seven-story fireproof building occupying an entire block in Brooklyn. He has an intimate knowledge of every detail of the business, gained from experience, and enjoys among the firm's workmen a wide popularity no less genuine than the esteem in which he is held among the men

CHARLES SCHWEINERT.

who have made and now direct the tire industry. Both rejoice for and with him in this culminating stage of his advancement.

Mr. Schweinert is an ardent sportsman and numbers among his clubs the New York Athletic Club, the Columbia Yacht Club, Society of Automobile Engineers, Machinery Club and the Akron City Club.

STATEMENT AND BALANCE SHEET OF THE INTERCONTINENTAL RUBBER COMPANY.

THE DIRECTORS of the Intercontinental Rubber Company, 15 Exchange Place, Jersey City, New Jersey, have submitted to their stockholders the following balance sheet and statement of surplus account for the fiscal year ended December 31, 1919. The statements have been prepared and certified to by Messrs. Loomis, Suffern & Fernald, chartered public accountants, New York City.

CONDITIONS IN MEXICO.

Operations at the company's Torreón factory were suspended on June 30, 1919, due to decreased shrub deliveries and low crude rubber prices. Advantage was taken of the opportunity to carry out extensive repairs and alterations, the latter designed to decrease the cost of production and increase recovery of rubber. Prices having somewhat recovered and a satisfactory demand for guayule rubber having developed, operations were resumed on December 15. General conditions throughout Mexico have, on the whole, improved and it is believed that a recurrence of paralyzing disorder is improbable. Claims for physical losses and damage to property during the revolutionary period have been lodged with a Claims Commission constituted by the Mexican Government, and the case will be followed with due diligence.

AMERICAN CONGO COMPANY IN AFRICA.

A number of years ago it became apparent to the directors of your company that wild rubber could not be profitably produced from the African Concessions of the American Congo Company in competition with Malaysian plantations, which will this year produce 90 per cent of the world's supply. Various unsuccessful attempts were made to utilize the Congo Company's

position to financial advantage, and in 1916 the option to purchase 500,000 hectares of land for Frs. 10,000,000 was allowed to expire, nothing having developed to warrant the expenditure of additional capital. Therefore, during 1919 the directors took advantage of an opportunity to sell the company's stock in the American Congo Company for \$25,000 in cash plus a contingent interest in a claim against the German Government for rubber confiscated in Belgium. Although difficult to establish and collect, the claim may ultimately have a value to your company of \$56,250. The established loss of \$170,112.50 was charged on the company's books against the general reserve previously set up against contingencies of this character.

SUMATRA PLANTATION.

The development of the Sumatra plantation continues to show satisfactory progress, but with increased costs due to the fact that rice, the principal food of the estate laborers, now costs eight times the pre-war price.

ARIZONA GUAYULE PLANTATION.

Experimental work on the Arizona guayule plantation has continued with what the directors believe to be very encouraging results.

CHILEAN NITRATE SYNDICATE.

Your company has participated in a syndicate formed to purchase and exploit a large tract of proven nitrate land in the Republic of Chile. The enterprise is promising, but its final development may be held in abeyance until there is an improvement in the general situation with regard to new construction and the procurement of equipment.

INVESTMENT SECURITIES.

The item of Investment Securities is made up of Liberty Loans, bonds and short-time notes. As will be seen by reference to the Surplus Account, the sum of \$58,202.27 was deducted from income to adjust this account to the market quotations of December 31, 1918.

BY ORDER OF THE BOARD OF DIRECTORS,

WILLARD P. SMITH, Secretary.

April 5, 1920.

CONDENSED BALANCE SHEET—DECEMBER 31, 1919.

ASSETS.	
Investments in	
Merged and subsidiary companies:	
By cash	\$3,762,159.09
By stock issues	28,198,575.30
Patents (exclusive of subsidiary companies)	\$31,960,734.39
Accounts and notes receivable, etc.	15,141.27
Advances to subsidiary companies	\$305,653.71
Sundry accounts	78,800.90
Advances on rubber	384,454.61
Investment securities	6,061.43
Cash	1,379,346.27
	316,258.74
	<u>\$34,061,997.21</u>
LIABILITIES.	
Capital stock, common	\$29,031,000.00
Accounts payable, taxes accrued, etc.	20,596.43
Reserve accounts	564,321.21
Surplus (as below)	4,446,079.57
	<u>\$34,061,997.21</u>
SURPLUS ACCOUNT	
Surplus December 31, 1918	\$4,417,297.77
Total profits and income from investments, etc.	\$215,237.25
Less:	
Administration, general expenses and taxes	\$5,923.08
Depreciation in market value of securities at December 31, 1919	159,314.17
	\$8,202.27
	<u>101,111.90</u>
Charges against surplus:	\$4,518,409.67
Cost of caring for Mexican properties (or shut-down expenses) 1918-1919	72,330.10
Surplus December 31, 1919	<u>\$4,446,079.57</u>

UNITED STATES TIRE PROMOTES SALES EXECUTIVES.

SUBSTANTIAL PROMOTION has come to six of the oldest executives in the sales department of the United States Tire Co. through the creation of six important new positions. The entire country has been divided into six large divisions, each to be under the direction of a sales manager, working directly under George S. Shugart, general sales manager.

In making these appointments the company has followed its custom of filling good positions with men developed in its own ranks, thus offering an incentive to those who remain in the organization to qualify for better places. It is worthy of note that the average length of service of the six appointees is eighteen years with the company, or with companies now merged with it.

E. H. Kidder, who advances from the position of Boston district manager to New England sales manager, has been a familiar figure in tire circles in New England for fifteen years.

In 1914 he assumed the duties of district manager at Atlanta, remaining there until 1918, when he acted for a time as district manager at Boston and later in an executive capacity in the general offices at New York City. In June, 1919, he was made district manager at Kansas City.

P. C. Anderson, western sales manager, began as an office boy 23 years ago at a wage of \$2.50 a week, with Morgan & Wright, then located in Chicago. He worked up through various clerical positions, and in 1910 became assistant branch manager. On the formation of the United States Tire Co. he was made office manager at Chicago for the larger company, and a year later, central district office manager. In 1914 he took charge of the Minneapolis branch. Five years ago he became branch manager at Chicago, and on January 1, 1917, stepped up another grade to the position of Chicago district manager.

Harry H. Hubbard, southwestern sales manager, entered the company's employ in 1903 as a bill clerk in the office of the G. & J. Tire Co. at Indianapolis. He served in the adjustment depart-

E. H. KIDDER.

S. ROE.

THOMAS R. BURTON.

P. C. ANDERSON.

HARRY H. HUBBARD.

WILLIAM C. PRICE.

After six years as a salesman, he took charge of the United States Tire Company's Boston branch in 1911, and in 1916 he was made district manager. His activities have centered in Boston since that time, except for a year spent in the service of the Emergency Fleet Corporation during the war. The position to which he has just been promoted gives him supervision of sales throughout New England, with headquarters in Boston.

E. S. Roe, who becomes Eastern sales manager, with headquarters at New York, is one of the oldest tire men in the United States in years of service, and is unquestionably the dean of the tire fraternity in New York. Next year he will complete a quarter century in the tire business. His connection with the industry began April 1, 1896, when he entered the bicycle tire repair shop of the Hartford Rubber Works Co., in New York City, as a repairman, and worked up through various office positions to be counter salesman. When an uptown branch of his company was opened he was made manager, which meant little, for he was the only man there and did everything from sweeping out to selling.

In 1903 the two New York branches of the Hartford were consolidated and Mr. Roe became New York district manager. When the United States Tire Co. superseded the Hartford in 1911, he was made New York branch manager by the larger concern, and in 1913 took charge of the New York district.

Thomas R. Burton, who takes over the sales managership of the Detroit division, is a twenty-year man in the company's service. He began as salesman for Morgan & Wright in New York in 1900, and nine years later was made Boston branch manager by the same company. In 1911 he became Pittsburgh branch manager for the United States Tire Co., and in 1912 went to New York as assistant to the eastern district manager.

ment and as traveling salesman until 1911 when, upon the formation of the United States Tire Co., he became Indianapolis branch manager for the larger firm. From 1912 to 1917 he was branch manager at St. Louis, and then went to Minneapolis for a year as district manager. The next year he spent as district manager at Kansas City. For the past year he has acted as western manager of distributors' sales, with headquarters at Chicago.

The connection of William C. Price, new southern sales manager, with the company, dates back to 1908, when he began as a traveling salesman at Pittsburgh for the Hartford Rubber Works Co. In 1912 he became a salesman for the United States Tire Co. at Cincinnati, and made a record that brought him promotion to the place of branch manager and then district manager in that city. In 1918 he went to Dallas, Texas, and established the company's new Texas district, and in October, 1919, was made district manager at Atlanta.

GRAND RAPIDS TRUCK TERMINAL OUTGROWN.

The rapid growth of the "ship by truck" movement in various sections of the country seems to forecast a greatly increased consumption of truck tires, both solid and the new giant pneumatics. The Minneapolis truck terminal, described at some length in the December issue of THE INDIA RUBBER WORLD, has close parallels in Grand Rapids, Michigan; St. Paul, Minnesota; and Louisville, Kentucky, while others will be added to the list with the coming of spring. The Ship by Truck Bureau of the Firestone Tire & Rubber Co., Akron, Ohio, is largely responsible for the movement.

The Grand Rapids truck terminal, which operates under the name of the Associated Truck Lines of Grand Rapids, was started in June, 1919. There are now 19 routes operating 32

motor trucks. Goods from wholesale and retail stores are carried from 22 to 50 miles into the country and neighboring towns, while farm produce and miscellaneous goods are handled on the return trips. By this means Grand Rapids merchants have stopped the inroads of Milwaukee wholesalers on their business made possible by lake transportation. By September the terminal was forced to move to larger quarters and is now handling more than 170,000 pounds of freight daily.

MEETING OF COMMITTEE D13, AMERICAN SOCIETY FOR TESTING MATERIALS.

Committee D13 of the American Society for Testing Materials met at the United Engineering Societies Building, New York City, April 16, 1920, and adopted the report of the Sub-committee III on Testing Machines and also voted to adopt the General Methods for Testing Cotton Fabrics designated as D39-18T, following a few minor changes.

Important papers on "Testing Machines and Laboratory Procedure," by W. O. Jelleme, A. E. Jury, and E. H. Barnwell, preceded a general discussion of proper recommendations by the committee on type of testing machines for textiles and suitable capacities for fabrics of varying strengths. The variables affecting the indicated breaking strength of a fabric to which special attention was drawn in the paper above mentioned were: (1) the design of the jaw; (2) machine capacity; (3) machine rate of load; (4) speed of pulling jaw.

The committee's recommendation in the matter of suitable machines for textile testing favored the inclined balance of pendulum type, limiting the use of individual machine to that capacity corresponding to the pull exerted when its pendulum makes an angle with the vertical not exceeding 40 degrees, beyond which point the rate of loading varies sufficiently to make accurate comparative tests impossible on machines of different capacities. The rate of loading recommended is 250 pounds per inch of travel of the head jaw, namely, the jaw attached to the dynamometer.

"The Measurement of Crimp in Yarns and Fabrics," by A. N. Gadsby and E. D. Walen, of the Textile Research Co., stated that crimp should be considered as the difference in distance between any two points on a yarn in a fabric and between the same two points after the yarn has been removed and straightened. The importance of determining crimp is indicated by the fact that the difference between the crimp of the warp and the filling of a tire fabric, designated as "off square," shows the disproportion in which the strain on the fabric will come in the finished tire.

Other papers of interest were "Possibilities of Air Conditioning for Textile Testing Laboratories," by A. M. Thompson, of the Cramer-Parks Company; "Moisture Effects upon Ducks of Varying Weights, and Fabrics of Unusual Character"; also "Variation of Apparent Strength with Machine Capacity," by G. B. Haven; "Experiments on Impact Testing for Fabrics," by E. D. Wallen, briefly discussed the breakage of groups of yarns from fabrics by their resistance to breaking by the sidewise impact of a swinging pendulum.

RUBBER BOOTS AND RAINCOATS FOR THE ARMY.

During the war the Clothing and Equipage Division of the Quartermaster General's Office bought 2,885,092 pairs of rubber hip boots at a cost of \$14,616,432 and 8,329,791 raincoats at a cost of \$44,932,308. In the first year of the war, from April 1, 1917, to June 30, 1918, the unit price of boots was \$4.82 and the 1,470,619 pairs cost \$6,606,384; in the year, June 30, 1918, to June 30, 1919, the price was \$5.289, and the 1,514,473 pairs cost \$8,010,048. The stock on hand to be accounted for on June 30, 1919, was 687,781 pairs, of which 116,202 were at supply depots, 600 at camps and posts, and 571,069 were overseas or in transit; 102,148 pairs were lost at sea during the war.

The price of raincoats the first year was \$5.21 so that the

4,744,822 supplied cost \$24,720,523. In the second year they had devised different coats for foot and mounted men. The raincoats for the latter cost \$5 each so that \$330,000 was paid for the 66,000 coats furnished. Most of the coats, however, were for the men who had to march, the price being \$5.65 and the 3,516,369 raincoats supplied cost \$19,878,785. The number in stock on June 30, 1919, was 354,965 infantry and 25,457 horsemen's coats in the United States and 886,464 raincoats in all overseas, making a total of 1,264,886 coats on hand. Besides these, 34,990 raincoats had been lost at sea.

GENERAL MANAGER, SYRACUSE RUBBER CO., INC.

GEORGE R. LOGGIE, treasurer and general manager of the Syracuse Rubber Co., Inc., Syracuse, New York, was born March 27, 1882, in Aberdeen, Scotland. Coming to this country with his people when a boy, he early set out to take care of himself, his only assets being a healthy body and an active, ambitious mind. In 1901 he entered the factory of the Diamond Rubber Co., Akron, Ohio, as a laborer and learned the manufacture of tires from the bottom up. From that time to the present he has been identified with the tire business in various capacities. He found time, however, to attend night school and eventually became an instructor in a business college which he attended. For a time he was a salesman for the Miller Tire & Rubber Co., and afterward was placed in charge of the Miller branch at Syracuse, New York.

GEORGE R. LOGGIE.

After a few years in Syracuse he tried to start a tire factory and failed, but one failure did not discourage him, and in 1919 he organized the Syracuse Rubber Co., Inc., and was elected treasurer, general manager, and a member of the board of directors.

Mr. Loggie is a member of the Elks and of the Optimist Club and is popular socially as well as in business circles.

W. R. GRACE & CO. PIONEER RUBBER IMPORTERS.

The interest of W. R. Grace & Co. dates back to 1854, when a group of rubber boot and shoe manufacturers appointed the firm their sole importing agent. The growth of the business brought about the formation of Sears & Co. in 1859 as a branch house at Pará and Manaus, and most of the rubber consumed in the United States passed through the hands of W. R. Grace & Co. From the early 'seventies until 1886 the greater portion of the crude rubber coming into New York went to that firm.

With the attempt of Charles R. Flint to monopolize the rubber market, Mr. Grace undertook to withdraw from the rubber trade, but to do this completely was impossible with an importing house of such magnitude. The dealings, however, were as small as possible till Mr. Grace died in 1904.

When plantation rubber became of importance, W. R. Grace & Co. became interested in crude rubber again, and since 1912

have had agencies in the principal markets of the world, London, Pará, Manáos, Singapore, Batavia, Medan, and Ceylon, with many correspondents throughout South America and the Orient.

C. KENYON CO. TO MANUFACTURE CORD TIRES.

On April 1, the C. Kenyon Co., Brooklyn, New York, operating the largest fabric rubberizing plant in the United States, started manufacturing Kenyon Cords, a new high-grade cord tire.

KENYONS' PLANT, BAY RIDGE, BROOKLYN.

Back of the Kenyon entry into the tire manufacturing field are over sixty years of experience in handling and manipulation of rubber, and the resources of a great plant equipped with modern tire-making machinery.

The decision of the Kenyon company to make cord tires is a logical development of their business and previous history. Starting in 1857, the company had acquired through long and varied experience an intimate and unique knowledge of rubber, its compounding, and its application to fabric. The two plants on Pacific street, Brooklyn, and on the Bay Ridge waterfront employ nearly 3,000 persons, and the products range from raincoats to the large rubber blankets used in offset printing plants. The company has been successful in producing cord fabrics for other tire manufacturers, and it is natural, in view of this, that the Kenyon brothers should decide to begin the manufacture of tires.

KENYONS' PLANT, PACIFIC STREET, BROOKLYN

The Kenyon company intends to produce oversize cord tires of the highest grade exclusively. Furthermore, the Kenyons have patented a new tread of rectangular form and truly non-skid properties because it offers a straight line resistance to both the side and forward skid. The tires are to be made at the Bay Ridge factory, a building of modern concrete construction and equipment, completed only last year, and having an initial capacity of 500 tires daily with provision for enlargement.

Besides every mechanical feature known to make the building safe, the factory contains such provisions for the service and health of the employees as a cafeteria with food at cost, recreation and smoking rooms, a roof garden and a finely-equipped hospital with a competent medical staff.

GOVERNMENT SALE OF HIP BOOTS AND OVERSHOES.

The director of sales of the War Department announced that the Surplus Property Division of the Quartermaster General's office had disposed of rubber goods at the subjoined prices, on the bids received up to the afternoon of February 15, 1920:

New rubber hip boots: 120 pairs at \$4.00, 120 at \$3.65, 600 at \$3.271, 2,000 at \$3.25, 120 at \$3.15, 240 at \$3.10, 3,000 at \$3.065, 1,000 at \$3.015, 120 at \$3.00, 840 at \$2.90, 5,740 at \$2.85, 1,200 at \$2.775, and 48,520 at \$2.75, nearly all of the last to one company.

New all rubber overshoes: 200 at \$2.05, 200 at \$2.00, 200 at \$1.75, 2,400 at \$1.50, 6,142 at \$1.49, 250 at \$1.465, 1,000 at \$1.45, 200 at \$1.41, 2,000 at \$1.40, 4,480 at \$1.35, 1,000 at \$1.33, and 67,440 to one company at \$1.29.

GEORGE W. SHERMAN, SALVAGE EXPERT.

GEORGE W. SHERMAN, for many years connected with The B. F. Goodrich Co., and now devoting his time to the development of the Akron Industrial Salvage Co., and other personal interests, graduated from the Massachusetts Institute of Technology in 1894 and immediately became connected with Colgate & Co., soap manufacturers, as assistant mechanical engineer. He was later identified with the Boston Woven Hose & Rubber Co. as master mechanic, and subsequently entered business for himself in Boston as a consulting mechanical engineer.

GEORGE W. SHERMAN.

Late in 1901 he came to Akron and was sent to Liverpool, England, by the stockholders of The Diamond Rubber Co., which at that time owned the Northwestern Rubber Co., of Liverpool. This company was engaged largely in reclaiming rubber, and Mr. Sherman served there as superintendent. Coming back to Akron several years later, he became the first mechanical engineer of the Alkali Rubber Co., now The Philadelphia Rubber Works Co. In 1908 he returned to the Diamond Rubber Co. and assumed charge of all by-product, scrap and salvage work, continuing as the head of these departments and in the same capacity for The B. F. Goodrich Co. after the consolidation, until his resignation on January 1 of this year.

It was during the war that Sherman organized the Akron Industrial Salvage Co., having as its members one hundred and twenty-five Akron manufacturers and merchants. The value that these members gained from their waste products so increased the scope of the work that it now calls for practically all of Mr. Sherman's time. His plan of organization was so thorough and effective that the Department of Commerce issued a special government bulletin dealing with the detailed development of the plan and its vast possibilities.

In addition to his other activities, Mr. Sherman is also in charge of the chemical department of The McAdoo-Akron Co., a new corporation recently organized to manufacture a rubberized cotton work glove.

EASTERN AND SOUTHERN NOTES.

By Our Regular Correspondent.

THE FISK RUBBER CO., Chicopee Falls, Massachusetts, has added to the site of its proposed building at Broadway, Eighth avenue, and Columbus Circle, New York City, the properties at Nos. 956-958 and 960-962 Eighth avenue.

The United States Rubber Reclaiming Co., Inc., will occupy temporary quarters at No. 20 West 60th street, New York City, pending the erection of its new building.

The Rubber Importers & Dealers Co., Inc., New York City, has increased its authorized capital from \$500,000 to \$1,000,000, and will remove on May 3 from its present location at Nos. 67-69 Wall street, to larger quarters at No. 200 Broadway.

The Triplex Tire Corporation, 903 Sixth avenue, New York City, has changed its name to Martin Tire Corporation. James Martin is president. The "Mono" cord tire and "Martin" super-cord tire, manufactured by this concern, were illustrated and described in our issue of February 1, 1920, on page 300.

Alfred Smith, Limited, dealer in chemicals for the rubber trade, will remove on May 1, 1920, from 98 Maiden Lane to Room 25, No. 98 Park Place, New York City.

Charles E. Wood, crude rubber broker, has removed from 149 Broadway to 287 Broadway, corner of Reade street, New York City.

In order to promote fraternalism among New York City rubber trade employees, the Rubber Trade Employees Social Society held an informal supper and dance at the Hotel McAlpin, April 14, when a very enjoyable evening was spent by the three hundred attending.

Pell & Dumont, Inc., dealer in crude rubber, has removed from 68 Broad street to 6-9 Hanover street, New York City.

Edwin M. Berolzheimer has been elected vice-president of the Eagle Pencil Co., New York City, in charge of factory operation.

The Morse Chain Co., Ithaca, New York, has moved its Greensboro, North Carolina, office to 404 Commercial Bank Building, Charlotte, North Carolina, where a complete exhibit of chain drives will be in operation. George W. Pritchett is southeastern manager.

Dunlop America Limited has closed its temporary office in New York City and established its whole staff in temporary quarters on the site of its new factory at Buffalo, New York. Quarters have been built to take care of 1,000 workmen on the new plant, and about 1,200 are being employed on the project. The foundations of some of the buildings are already completed and towers erected for the pouring of concrete for the finished-product warehouse, to be 560 feet long and four stories high. P. D. Saylor is vice-president and general manager. Mail for the company should be addressed to Postoffice Box No. 448, Buffalo, New York.

The Hewitt Rubber Co., Buffalo, New York, is building a two-story addition to its office building, which will cost approximately \$25,000.

The Hydraulic Press Manufacturing Co., Mount Gilead, Ohio, has opened an office in the Mutual Life Building, Buffalo, to take care of business in that territory. R. K. Havlicek is in charge.

E. I. du Pont de Nemours & Co., Wilmington, Delaware, has elected the following directors for the ensuing year: F. D. Brown, H. F. Brown, E. G. Buckner, R. R. M. Carpenter, Walter S. Carpenter, Jr., Frank L. Connable, William Coyne, A. Felix du Pont, Alexis I. du Pont, Eugene du Pont, Eugene E. du Pont, H. F. du Pont, Irenée du Pont, Lamont du Pont, P. S. du Pont, J. B. D. Edge, H. G. Haskell, J. A. Haskell, J. P. Laffey, C. A. Meade, Charles A. Patterson, Charles L. Patterson, F. W. Pickard, H. M. Pierce, John J. Raskob, Charles L. Reese, W. C. Spruance, and F. G. Tallman.

Yarnall-Waring Co., Chestnut Hill, Philadelphia, has recently opened an office in the Candler Annex, Atlanta, Georgia, in

charge of D. T. Newman, formerly with the Philadelphia sales office.

The factory staff of the New Castle Rubber Co., New Castle, Pennsylvania, as recently organized, consists of: L. C. Sturgis, works manager; K. E. Rogers, purchasing agent; C. A. Hemingway, manager material service; V. C. Hosellman, manager factory accounting; Willis H. Grant, chief chemist; F. T. Zeisiger, operating superintendent; R. J. Carl, material preparation superintendent; M. H. Daniels, technical superintendent. C. L. Copley, formerly operating superintendent, has been placed in charge of the cord tire development department.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON NOTES.

THE TRENTON RUBBER MANUFACTURERS began to feel some uneasiness over the recent railroad strike because of the scarcity of coal and the fact that raw materials might run short. The Empire Rubber & Tire Corp. was the only rubber plant that was compelled to shut down for a couple of days because of the scarcity of coal. The plant is now in full operation again. The various rubber companies have their warehouses overcrowded with goods due to the strike and it will take some time to get the product started on the road. Meantime, customers were compelled to wait for the shipment of supplies. Fortunately the Trenton concerns had enough raw materials on hand to tide them over the strike.

Hyman A. Rosenthal, proprietor of the Nearpara Rubber Co., 79 Prince street, Trenton, whose plant was destroyed by fire a short time ago, has awarded a contract for a new structure. The main plant will be constructed of steel, one story in height, and will measure 100 by 125 feet. There will also be a boiler room and power plant attached. The company expects to be ready for operation again by June 1. The machinery, which was badly damaged by flames, will be overhauled and rebuilt by the William R. Thropp & Sons Co., of Trenton. The fire entailed a loss of between \$50,000 and \$100,000. A temporary office building has been erected to take care of business until the new works is completed.

Andrew Wurflein, father of Peter E. Wurflein, Canadian representative of the New England Rubber Co., died recently at his home in Trenton.

John A. Lambert, treasurer of the Acme Rubber Manufacturing Co., who was recently made president of the Trenton Chamber of Commerce, has stirred up the Trenton merchants by declaring that outrageous profiteering is being carried to extremes. He has called a meeting of the merchants to discuss the high cost of living. He has also taken up the question of a shortage of houses in Trenton, and says that he finds that the scarcity of dwellings is not as great as reported.

The Pocono Rubber Cloth Co., which recently purchased the plant of the Howard Demountable Rim Co., Trenton, and $4\frac{1}{2}$ acres of land, has awarded a contract for the erection of extensive additions. The contract calls for the erection of a power house, 43 by 45 feet; an engine room, 25 by 70 feet, and a drying and unloading building, 26 by 170 feet. The buildings will be one story, of brick and concrete, and the entire work will cost about \$50,000. There will also be another structure to house two large vulcanizing rooms. The work is to be completed in eight weeks.

The Acme Tire Co., of which W. Bradford Stryker is general manager, is having a new building erected on East Front street, Trenton. The company's present home will be razed to make room for city improvements.

The Ajax Rubber Co., Inc., Trenton, recently gave an entertainment at the Crescent Temple and had as guests its 1,200 em-

ployes and their families. All the higher officials of the company were present when manager Louis P. Desbriats announced that the concern had decided to grant free life insurance to all the employees of the works. At the entertainment exclusive motion pictures were shown and the guests enjoyed a banquet and dancing. The company reports conditions prosperous and will shortly enlarge the plant.

William J. B. Stokes, treasurer of the Thermoid Rubber Co., and Mrs. Stokes have left for an extended trip through the West Indies and Panama. They will be absent for several weeks and will stop at Havana, Kingston, Santiago, Costa Rica, Panama and the Bahama Islands.

MISCELLANEOUS NEW JERSEY NOTES.

The Manhatran Rubber Manufacturing Co., of Passaic, New Jersey, will build a plant on the Whippany River, near Morristown, for the purpose of reclaiming rubber. Several buildings of reinforced concrete, to cost \$500,000, will be erected and the company will employ 250 men. Later, homes for the workmen will be erected.

The Lambertville Rubber Co., Lambertville, New Jersey, will erect a large brick building along the creek and will eventually do away with the present frame factory buildings. The company will also erect a brick building for its printing office.

The Rubber Celluloid Products Co. will erect a one-story brick storage building at its plant at Newark, New Jersey, 39 by 69 feet, at a cost of \$11,000.

During the recent transportation tie-up the Somerset Rubber Reclaiming Works, New Brunswick, New Jersey, maintained a fleet of motor trucks in constant operation to afford their customers prompt service.

The Intercontinental Rubber Company, Jersey City, New Jersey, at its annual meeting on April 5, elected the following officers and directors: G. H. Carnahan, president; E. B. Aldrich, vice-president; J. C. Treadwell, vice-president; W. P. Smith, secretary and treasurer; G. Harrington, assistant secretary; directors—G. H. Carnahan, chairman; E. B. Aldrich, H. A. Bingham, C. A. Corliss, W. Dutton, J. R. Morron, Elton Parks, W. C. Potter, F. T. Rosen, C. H. Sabin, W. P. Smith, and H. H. Vreeland.

The Fulton Rubber Type, Ink and Pad Company, which was incorporated under the laws of New Jersey, December 13, 1905, changed its name on June 11, 1915, to Fulton Specialty Company. The principal office is now located at 128-142 Fulton street, Elizabeth, New Jersey, and the agent in charge is E. Rogers Underwood. The authorized capital stock of the company is \$150,000, and the company manufactures stamp pads, rubber type, daters, etc.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

WHILE there is little change in the business situation among the Rhode Island rubber mills, the textile establishments engaged in the production of tire fabrics throughout the state, are being driven to their utmost capacity with day and night shifts. Nearly every concern now identified with this growing branch of the rubber industry either has new buildings in process of construction, or is planning extensions of a material size.

The majority of the rubber industries are still rushed with work and have plenty of orders ahead, but the problem of securing enough help is a handicap to many manufacturers who are also confronted by labor unrest. Nor is the shortage of help the only contingency. Railroad strikes with the consequent tie-ups, embargoes, and congestions of freight by rail and by boat, prevent the transportation of supplies and finished products, while the steadily skyrocketing of wages and shortening of hours add to the general disorganization.

Because of the embargo on freight, by both rail and water, the National India Rubber Co., Bristol, early in the month chartered a small 200-ton steamer to help out in the unusual emergency that arose primarily through the strike of longshoremen in New York, and was added to by the consequent strike among the railroad employees. The steamer brought to Providence 175 tons of freight from New York, and loaded all she could carry of the nearly 1,000 tons which had accumulated at the State Pier waiting for transportation. Otto B. Munroe, traffic manager of the Revere Rubber Co., was in charge of the work.

One of the most interesting and important events of the past month in connection with the whole rubber industry was the transportation of upwards of 1,000,000 pounds of cotton fabric, valued at \$2,500,000 from Providence and vicinity, to Akron, Ohio. The shipment was made on 100 automobile trucks and was for the purpose of relieving the shortage of tire fabric, due to the railroad strike through the Middle West and the resultant express and freight embargoes. This is said to be the biggest truck transportation venture ever attempted from the East, both in point of distance and volume, as well as in value. The material was collected from the following mills in this vicinity, which usually ship the cotton fabric to Akron by the railroads: Connecticut Mills, Danielson, Connecticut; Naushon Weaving Co. and Passaic Cotton Mills, New Bedford, Massachusetts; Jencks Spinning Co., Pawtucket, Rhode Island; Ninigret Mills and Westerly Textile Co., Westerly; and Goodyear Cotton Mills, Inc., Killingly, Connecticut.

Each fleet averaged twenty trucks, headed by a pilot car. Spare trucks for use in case of emergencies were placed along difficult parts of the route in the mountains where the regular machines might break down. The contents of each truck was insured at \$25,000 for the trip. The cotton fabric is valued at \$2.50 a pound, so that the 1,000,000 pounds which were moved within a week was worth \$2,500,000. The use of trucks will be continued at least until freight service becomes normal, the trucks returning here from Akron loaded with western products which have a market in this vicinity, so that no truckage distance is wasted.

About 500 members and friends were present at the first annual dance of the Davol Rubber Company Benefit Association, Providence, held on April 16. A short address on the benefits to be derived from membership in the association was given by general manager Wesley. The association is open to all persons over 16 years of age employed by the concern. The officers are as follows: president, Joseph Harris, Jr.; vice-president, M. Burnham; secretary, A. Goff; treasurer, C. Bamford; directors—Frederick Keenan, Anna Riley, Nellie Ward and Thomas Ryan.

The Goodyear-Rankin Co., with headquarters at Providence, has opened its new quarters at 37-49 Snow street, removing thereto from 57 Westminster street, where the company has been located for nearly twenty years. The new building has four floors and a large basement, with two elevators for freight and a large sunny show and salesroom, with every facility for handling the firm's large tire trade.

The Hayward Rubber Co. is fitting up a new store on Union street, near Washington street, Providence. There will be new balconies, show cases, counters, new entrance, new windows, hardwood floors, steel stairways and paneled work.

The O'Bannon Corporation, at West Barrington, Rhode Island, will erect a 100,000-gallon water tank on its premises, for fire protection.

Good progress is being made on the new mill being erected for the Mount Hope Spinning Co., Warren, Rhode Island. This concern has been operating 13,000 spindles on tire fabric, but with the new mill 26,000 spindles will be available. The new structure, which is 200 feet long, and two stories high, will be occupied the first of August. A new warping room extension

is being erected which almost connects the old and the new structures. Other improvements are under consideration and it is expected that the coming summer and fall will witness numerous additions to this plant and its equipment.

The Xinigret Co., manufacturers of tire fabrics, is enlarging its plants at both Pawtucket and Westerly, Rhode Island, to practically double their capacity, by the purchase of property adjacent to its present holdings. It intends to erect new buildings of the latest type, to be equipped with modern up-to-date machinery. During the past month the concern has purchased a large tract of land on Middle and Fountain streets and Central avenue, in Pawtucket, the revenue stamps affixed indicating an outlay of approximately \$39,500. Only a short time previous the corporation purchased property immediately adjoining its plant in Pawtucket, at a cost of \$35,000.

Work is to be started soon on a \$15,000 brick addition, one-story high, to the plant of the Phillips Insulated Wire Co., at Pawtucket. It will be 45 by 81 feet, of mill construction with steel beams. Other additions and improvements will probably be carried into effect during the coming summer.

The American Wringer Co. is erecting a new building on Social street, Woonsocket, where rubber-covered mechanical rolls will be made. It is to be a three-story brick structure, 180 by 60 feet, and will be completed early in October. More than 100 hands will be employed in the new mill.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

RUBBER GOODS amounting to \$20,757,875 represented about one-thirteenth of the value of all manufactures in Massachusetts for the year 1918, according to the thirty-third annual report of the director of statistics, which has just been published. Substantial gains over the previous year are shown, and the state still maintained its leading position in the manufacture of rubber boots and shoes.

Eight establishments with an invested capital of \$27,562,384, using stock and materials valued at \$21,673,939, and paying wages amounting to \$11,162,572 to an average of 13,815 wage earners, produced rubber boots and shoes to the value of \$54,098,670. Wage earners averaged \$808 annually, there being about 8 males to 5 females.

Forty-three establishments with an invested capital of \$44,791,412, using stock and materials valued at \$31,481,177, and paying wages amounting to \$7,588,584 to an average of 7,613 wage earners, produced other miscellaneous rubber goods to the value of \$66,659,205. Wage earners averaged \$996.79 annually, there being about 12 males to 3 females.

The total value of rubber goods exports is not stated, but nineteen establishments selling rubber products exclusive of rubber boots and shoes exported goods valued at \$1,814,350.

The average number of wage earners in the rubber industry of the state shows remarkable uniformity throughout all months of the year, operatives on rubber boots and shoes averaging 287 working days, and operatives in all other lines of rubber goods 278.8 working days. Weekly salaries ranged from \$5 to \$35 and above. On rubber boots and shoes most male workers received from \$16 to \$30 or more; female, from \$10 to \$25; minors, from \$10 to \$18. In other miscellaneous lines most male workers received from \$15 to \$35 or above; female, from \$12 to \$30; minors, from \$7 to \$13. Of the 21,428 average rubber workers in the state, only 1,775 were under eighteen years of age.

Whereas, most of the rubber footwear is produced in or near Boston, most of the miscellaneous rubber products are manufactured elsewhere in the state. In metropolitan Boston five establishments, with an invested capital of \$23,591,113, using stock and materials valued at \$17,581,737, and paying wages

amounting to \$9,729,789 to an average of 12,075 wage earners, produced rubber boots and shoes to the value of \$44,475,483. Wage earners averaged \$805.78 annually, there being about 7 males to 5 females. Miscellaneous rubber goods to the value of \$17,417,810 were produced by twenty-four establishments with an invested capital of \$9,715,814, using stock and materials costing \$7,183,310, and paying wages amounting to \$2,048,186 to an average of 2,220 wage earners. Wage earners averaged \$922.61 annually, there being about 8 males to 3 females.

The Hood Rubber Co., Watertown, Massachusetts, has announced that the plant will close down on Saturdays for twelve weeks during the summer months, with all operatives in the employ of the company for more than three months receiving full pay for a six-day week. Operatives with the company less than three months will receive half-pay for these Saturdays, except those who have worked less than one month, who receive no compensation. The plan takes the place of a summer shut-down and is intended to give an equivalent for Saturday half-holidays during the season of outdoor recreation in a business where half-holidays are difficult to arrange. It is on trial as an experiment this year as it was last and has not been adopted permanently.

"Multibestos Company" is the new firm name recently adopted by the stockholders of the Standard Woven Fabric Co., Walpole, Massachusetts.

The Tyrian Service Association, the recently formed employee organization of the Tyer Rubber Co., Andover, Massachusetts, held the second of a series of dances on the evening of April 6. Frederick H. Jones, treasurer and general manager of the company, was present and in a brief address expressed appreciation of the spirit of cooperation manifested. These dances are held to promote community feeling in the organization and the proceeds are used to aid and bring comfort to sick and needy employees.

The Avon Sole Co., Avon, Massachusetts, will enter the tire field shortly with a new tire developed by Everett T. Packard. The company is being reorganized and the plant will be doubled to take care of the new tire building machinery.

Everlastik, Inc., has completed a new three-story mill addition in Chelsea at a cost of approximately \$75,000.

Rubber manufacturers are finding their factory papers published in the interests of employees a very potent means of promoting their Americanization work. Not only are the advantages of American citizenship made plain to foreign-born workers, but the March issue of the "Bowohoco News," for example, tells on its front page exactly how to become a naturalized citizen. Incidentally, this news sheet of the Boston Woven Hose & Rubber Co., Cambridge, not only contains the timely personal mention of the plant, but is one hundred per cent American, patriotic and common sense in its suggestion and inspiration. It is a shop paper with interest and a moral for every worker.

The Monatiquet Rubber Works Company, South Braintree, Massachusetts, is bringing an additional reclaiming unit into operation, which it is believed will increase the company's output by 20 per cent. The laboratory, also, has been enlarged and is now in charge of J. F. O'Donnell. The company has recently introduced to the trade two new products for specific uses in rubber compounds.

BOSTON NOTES.

More than 200 members of the Employment Managers' Association met at a luncheon dinner and conference on mutual benefit associations and group insurance at the Hotel Vendome, Boston, April 8. Dr. R. S. Quinby, president of the association and service manager of the Hood Rubber Co., Watertown, presided.

In his address, Dr. Quinby said that the big corporations fully realize that the health of the workers is important to the life

of the concern, and told of the health methods used at the Hood Rubber Co. plant, where some 10,000 men and women have a very small sick rate. Every new employee is given a thorough physical examination to discover defects that can be corrected. When a worker is absent, a nurse calls at his home. If he continues ill, the foreman of the department calls and, upon his report, a sick benefit is paid.

Frank A. Vanderlip, a director of the United States Rubber Co., and former president of the National City Bank of New York, will lecture on business economics at the Harvard graduate school of business administration, beginning September 1.

A conference of all the New England managers of the service department of the United States Tire Co. was held at the Hotel Thorndike, Boston, early last month. Factory representatives were present to discuss technical features of tire construction. R. R. Drake, of New York, at the head of the department, gave a talk on courtesy and business correspondence. A banquet and theatre party furnished the entertainment features.

The Firestone "Ship by Truck" movement is rapidly gaining ground in and about Boston, and despite the severe winter has proved of material assistance to the railroads, especially during the freight and express embargoes when terminals were badly congested and the shortage of freight cars was particularly acute.

It was estimated that approximately 35 per cent of the freight awaiting loading at the railway terminals during the embargoes was intended for delivery at points not more than 50 or 60 miles distant from Boston. The vast bulk of that 35 per cent was capable of being delivered by motor truck.

Aside from the efficiency of delivery, the added service which the motor truck can render, the motor express if more widely used by shippers in New England would relieve a very real burden under which the old-established systems of transportation are laboring.

More than 500 independent trucking operators are listed with the bureau, and wholesalers, manufacturers and others are learning that they may call on the bureau at any time for help in rushing cargoes to distant points or in bringing into the city merchandise and produce from manufacturers in other cities or from the farms. This service, it should be said, is given without cost and without obligation.

The annual costume party of The B. F. Goodrich Co. employees was held on the evening of April 15 at Hotel Hemenway, Boston. The affair was a most enjoyable one, with about five hundred in attendance. Prizes were awarded for the prettiest and funniest costumes. The judges were District Manager F. T. Moore, W. H. Hickey, E. E. Leach and Frank Keene.

The Campbell Motors Corporation, 715 Beacon street, Boston, has been appointed New England distributor for Stronghold tires and tubes and is appointing local dealers throughout the territory. Chester I. Campbell and A. N. Dodge will direct the sales organization.

Green & Swett, 821 Boylston street, are Boston distributors of Madison tires.

The Simplex Rubber Co., 65 Broad street, Boston, has been incorporated under the laws of Massachusetts with a capitalization of \$50,000 to manufacture and distribute the Marconi heel rubber, a patent non-skid, tight edge, no-cement rubber heel. Major William F. Killip is president of the company, and William F. Donovan is secretary. The moving spirit in the organization is Gilbert F. Quinn, a man of long and varied experience in the shoe and rubber heel and sole business with the Goodyear and Firestone companies, and the Dryden Rubber Co., of Chicago, Illinois.

The Gillette Tire Co., 587 Boylston street, Boston, is a branch of the Gillette Rubber Co., Eau Claire, Wisconsin, and New

York City, and has no connection with the Gillette Rubber Co., formerly at 110 Federal street, Boston, now out of business.

GENERAL MANAGER OF FIRESTONE STEEL PRODUCTS CO.

L. G. FAIRBANK, newly elected vice-president and general manager of the Firestone Steel Products Co., Akron, Ohio, brings to his office a varied business experience well fitting him for his important duties, and enabling him to view problems from the other man's standpoint as well as his own.

Born in Cleveland, Ohio, February 27, 1886, he was educated in the West High School of that city and in 1905 entered the employ of the Struthers Furnace Co. as a stenographer. Two years later he entered the book-keeping department and the following year was made purchasing agent.

Attracted by the rubber industry, he obtained a position in the dealers' helps department of the Diamond Rubber Co. in 1910, and two years later went to the Firestone Tire & Rubber Co. as assistant advertising manager. From that time his advancement has been rapid, even in a fast-growing organization conspicuous for constant promotion of men of merit. In 1916 he was made an eastern district manager; in 1918 eastern sales manager, and assumed his present duties the first of the present year.

Mr. Fairbank is a member of all Masonic orders, including the thirty-second degree, Knights Templar and Shrine.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE story of rubber in Akron this year will be the expansion of the industry to the four quarters of the world. The business has grown to such proportions that it is no longer possible to confine it to the city itself.

Although approximately \$10,000,000 worth of new buildings are now definitely under way, announcements have been made of branches and factories in South America and in the Orient, following the announcement that the Firestone Tire & Rubber Co. will erect a plant in Los Angeles to compete with the Goodyear Tire & Rubber Co. in its new field.

As one means of offsetting mounting costs of raw materials, particularly cotton for fabric, the Firestone Tire & Rubber Co. is sending American machinery into the Far East to replace time-consuming methods of handling crude rubber. The machinery will go into a million-dollar plant the company is erecting on the Kalang River at Singapore, Straits Settlements, the center of the world's crude rubber market. The plant will be operated by a Firestone subsidiary company—The Firestone Tire & Rubber Co. (S. S.), Limited—which was organized for the purpose.

In addition to replacing tedious manual labor with machinery, the plant will clean, condition and compress the rubber in such manner that it will occupy less space aboard ship, thereby saving on freight charges. The cleaning process, carried on by colloid-operated machines, will also effect a saving in that it will permit the rubber to go to the skilled hand of the mill operator immediately upon its arrival in Akron.

L. G. FAIRBANK.

The Goodyear company recently announced the establishment of a complete rubber plant in Rio Janeiro, Brazil, primarily to take care of the rubber products business of South America, but also to prepare crude rubber for the manufacture of rubber goods in Akron. The Brazilian plant will cost approximately \$1,000,000.

The Goodyear Tire & Rubber Co. is about to build a rim plant in the southern part of Akron on the Baltimore & Ohio Railroad. This move naturally follows the success of the Firestone entry into the rim and steel products business. The new factory will be a one-story brick and steel structure 250 feet wide and 600 feet long and will accommodate 500 workmen. Steel for the structure is arriving daily and a large part of the rim making machinery, for which contracts were let many months ago, has arrived on the ground. It is expected that the new rim factory will be completed about July 1, at which time the present rim department, of 600 daily capacity, will move into the new building.

The Firestone rim plant is being practically doubled and the new addition is nearly complete and ready for operation.

Akron business men and rubber manufacturers do not look upon The Goodyear Tire & Rubber Co.'s Los Angeles and Canadian projects as in any way injuring the position of Akron in the rubber world. Figures prepared by the Akron Chamber of Commerce indicate that if the rubber factories of the city do not expand in the future it will still require the city at least five years completely to catch up with its present industrial development. Much gossip has gone the rounds regarding the moving of rubber plants from Akron, but a personal interview by the writer with practically all the leaders in the rubber industry indicates that these men look upon Akron as the center from which their industries will expand. Akron, they hold, will always be the center of the industry.

For the present, at least, the housing situation in Akron has seriously handicapped the expansion of the industry here. It is estimated that the city is at least 20,000 homes short. Manufacturers hesitate to ask thousands of men to come to the city to fill their plants to 100 per cent capacity when it is practically impossible at present to bring their families and establish homes.

The Akron plan for Americanization promises to be a model for the whole country. The plan was approved at a meeting of Americanization directors at New York City recently and will probably be adopted at a national meeting to be held in Minneapolis, Minnesota, next summer. E. C. Vermillion, formerly with the Firestone Tire & Rubber Co., is now director of Americanization for the city.

Statistics prepared by the Chamber of Commerce of Akron show that Akron plants import an average of 103,374 ship tons

of raw materials a year and export 58,016 ship tons. Approximately 42,120 ship tons of tires and rubber goods are exported yearly through Atlantic ports and 6,124 through Pacific ports.

The peak demand for automobile tires in the world will be 80,000,000 a year, it is stated in a report recently made public by the Akron Chamber of Commerce. The estimate includes tires for both pleasure cars and trucks. According to the same report, 45,600,000 tires are being manufactured in the United States at the present time.

At the end of the present year the demand will be 57,000,000 tires a year, it is stated. The figures are based upon the estimates of automobile and truck manufacturers that during the present year 1,600,000 pleasure cars and between 375,000 and 450,000 trucks will be turned out.

With an enrolment of 5,700, the new Goodyear Industrial University was dedicated in Akron last month. The Industrial University makes its advent into the educational world with a faculty of 117, the school's 65 class-rooms being housed in a new \$2,500,000 recreational hall of the Goodyear Tire & Rubber Co. The classes, which are free, offer 33,000 employees, courses ranging from Americanization work to post graduate studies for college men and women.

The B. F. Goodrich Co., Akron, is preparing "New Goodrich Field," formerly Liberty Park, for spring athletics. It contains ten acres and improvements will cost \$15,000. Athletics at the plant are under the direction of Eddie Connors.

The executive committee of the board of directors of The B. F. Goodrich Co., Akron, has announced that the employees of the company will be permitted to purchase stock of the company. Plans for a campaign to sell the stock to the employees will be announced before July 1.

A large part of the electricity used in The B. F. Goodrich Co., Akron, will be brought 100 miles from West Virginia. The power plant near Wheeling has a capacity of 120,000 kilowatts.

Among the rubber companies which have announced that they will have baseball teams in the field this spring are the Amazon, General Tire, Goodrich, Goodyear, Kelly-Springfield, Miller, Philadelphia and the Star companies.

Rubber company officials are assisting in the formation of a flying club in Akron. The membership will be made up of ex-army fliers. The government war work in aviation in Akron has given the industry a boost here upon which the fliers are depending for a great portion of their success. Commercial aerial transportation will be the main object of the new club.

The Miller Rubber Co. has announced that all unsalaried employees of the company will be given a two-weeks' vacation with pay. Salaried employees will continue to have their regular vacations with pay. If the employees recently granted vacations

EVIDENCE OF THE REMARKABLE GROWTH OF AKRON DURING THE LAST FEW YEARS IS SHOWN BY THE ACCOMPANYING PHOTOGRAPH. THE VIEW WAS TAKEN FROM THE TOP OF A 250-FOOT BRICK SMOKESTACK BEING ERECTED BY THE B. F. GOODRICH RUBBER COMPANY AND SHOWS HOW THE CITY HAS EXPANDED IN ALL DIRECTIONS TO MAINTAIN ITS PLACE AS THE RUBBER CENTER OF THE WORLD.

wish to work they will be given double pay for the period considered as their vacation.

The Goodyear Tire & Rubber Co., Akron, has purchased from the Government the Wingfoot aviation station near Akron and will continue to build and test dirigibles. The consideration paid for the station has not been made public, but it is estimated that approximately \$400,000 was paid for it. Tentative plans call for establishment of a flying school for the training of airship pilots, in anticipation of the needs of airship lines in various sections of the country.

Announcement has been made that the Miller Rubber Co. will build extensions to its plant in Akron to cost approximately \$861,000. Three buildings are contained in the program. Increased business made the additions necessary.

The Portage Rubber Co., Akron, has elected the following officers for the ensuing year: M. S. Long, president; J. W. Maguire, vice-president; H. M. Kerr, secretary; W. E. Wilson, treasurer, and R. J. Cole, assistant treasurer.

The McAdoo-Akron Company, Akron, was incorporated in July, 1919, and specializes in the manufacture of "Wearflex" rubberized cotton gloves in two styles, one fully rubberized and one palm-faced, reinforced with rubberized fabric. The present officers of the company are: J. S. Pattie, president; G. H. Van Hynning, vice-president; C. D. Benson, secretary; H. C. Wissman, treasurer; T. O. McAdoo, general manager, and B. E. Rockwood, assistant general manager. The directors include the above in addition to G. W. Sherman, F. H. Lahmar, Dr. S. E. McAdoo and C. K. Strobel.

MID-WESTERN NOTES.

By Our Regular Correspondent.

EARL P. LOGAN, the new director of sales for the Kokomo Rubber Co., Kokomo, Indiana, is one of the youngest sales executives in the business. He left the banking business to take up tires. He was branch manager for the Kokomo company at Dallas, Texas, then district sales manager at St. Louis, and more recently department manager at Chicago.

EARL P. LOGAN.

The International India Rubber Corporation, South Bend, Indiana, has appointed H. C. Buchanan production superintendent. Mr. Buchanan formerly held a similar position with the Kelly-Springfield Tire Co. at Akron, Ohio.

The Akron Engineering Co., Akron, Ohio, is building a new plant for the Lynch Tire & Rubber Co., formerly of Kansas City, but now of Carthage, Missouri. The structure will be approximately 60 by 300 feet, including power house, office, etc., and tires, tubes, and other rubber products will be made. The Hannibal Rubber Co., 305-306 Hannibal Trust Company Building, Hannibal, Missouri, has completed 80 per cent of its \$150,000 modern tire and inner tube plant, and will install machinery to cost approximately the same amount. It will manufacture the "Mark Twain" tire and the "Indian Joe" inner tube, and expects to be able to market production by the autumn. A. E. Gibson is secretary.

The Nebraska Tire & Rubber Co., Omaha, Nebraska, has elected the following officers for the ensuing year: Alva Smith, president; G. C. Peironnet, vice-president; F. M. Holloway, secretary; and W. W. Wuchter, treasurer and general manager.

APRIL MEETING OF THE MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.

The April meeting of the Mid-West Rubber Manufacturers' Association was held at the Chicago Athletic Association on Tuesday, April 13, and was attended by fifty members. Luncheon

was served at noon, after which remarks were made by a number of those present, and many points of interest to the members of the trade were brought out.

President John T. Christie occupied the chair, and urged upon all those present the importance of extending the membership of the Association to accomplish the aims for which it was organized. He pointed out that the Association is dependent entirely upon its income from initiation fees and annual dues, and that in order to develop the organization and put it upon firm financial footing every member will have to constitute himself a special membership committee, and try to bring at least one new member to each monthly meeting. If this could be done, there would be no question about the success or the influence of the organization. He was very glad to announce that the board of directors has recommended favorable action upon the following applications for membership:

Regular Members.

Braender Rubber & Tire Co., Rutherford, New Jersey
The Meyer Rubber Co., Columbiana, Ohio
The India Tire & Rubber Co., Akron, Ohio
Master Tire & Rubber Co., Dayton, Ohio
The Cleveland Rubber Corporation Co., Cleveland, Ohio
Fort Wayne Tire & Rubber Mfg. Co., Fort Wayne, Indiana
Zenith Tire & Rubber Co., Cleveland, Ohio
Iowa Cord Tire Co., Des Moines, Iowa
The National Tire & Rubber Co., East Palestine, Ohio
The Spreckels Savage Tire Co., San Diego, California

Associate Members.

Bolle-Watson Co., Inc., New York City
Bloomingdale Rubber Co., New York City
Sessions Engineering Co., Chicago, Illinois
General Electric Co., Chicago, Illinois
The Herman Tire Building Machine Co., Lancaster, Ohio
The H. B. Bixler Co., Akron, Ohio
Meyer & Brown, Inc., New York City
Tower Cotton Mills, Inc., Niles, Michigan
The Banner Machine Co., Columbiana, Ohio
Albert E. Burr Co., New York City
J. T. Johnstone & Co., Inc., New York City
Rubber Importers & Dealers' Co., Inc., New York City
E. S. Kuh & Volk Co., New York City
L. Littlejohn & Co., Inc., New York City
Baird Rubber & Trading Co., New York City
Brander & Curry, Inc., New York City
Manhasset Manufacturing Co., Providence, Rhode Island

Upon motion duly adopted the above members were unanimously elected.

Among those who spoke briefly at the meeting were: Ole Hibner, The Cleveland Rubber Corporation Co., Cleveland, Ohio; F. M. Hutchinson, Braender Rubber & Tire Co., Rutherford, New Jersey; W. F. Harrah, National-Standard Co., Niles, Michigan; H. B. Bixler, The H. B. Bixler Co., Akron, Ohio; W. H. Herman, The Herman Tire Bldg. Machine Co., Lancaster, Ohio; Harry Hunter, The Hunter Dry Kiln Co., Indianapolis, Indiana; J. C. Brown, Fort Wayne Tire & Rubber Mfg. Co., Fort Wayne, Indiana; G. G. Yule, The Falls Rubber Co., Cuyahoga Falls, Ohio; C. A. Brunner, General Electric Co., Chicago, Illinois; W. E. Lape, The Barrett Co., Chicago, Illinois; R. Paul McElrath, McElrath Tire & Rubber Co., Ravenna, Ohio.

The remarks of Edward S. Babcox, vice-president of the Akron Advertising Agency Co., Inc., in which he made some comments and suggestions in respect to the immediate future of the demand for tires were listened to with great interest.

After the general meeting of the Association the rubber manufacturers held a further session.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent

LOS ANGELES NOTES.

MUCH OF THE SUCCESS of the young and flourishing Samson Tire & Rubber Corporation, Los Angeles, California, is due to the energetic president and general manager, Adolph

ADOLPH SCHLEICHER.

Schleicher, who founded the corporation, although he modestly gives the major part of the credit to his loyal and capable coworkers. Mr. Schleicher is a graduate of Purdue University, Indiana, where he specialized in civil engineering. After building plants for the Home Telephone Co. in Indianapolis, the Columbus, Greene, and Richmond traction companies and part of the McKinley Traction Co.'s plant, he became vice-president of the Mutual Tire & Rubber Co. of New York. He is a director and was formerly president of the Monterey Land Co., and for eight years was president of the Pacific Slope Development Co. of Los Angeles. Mr. Schleicher was also president of the International Electric Co. of Delaware until that concern was merged into a larger one.

The Goodyear Tire & Rubber Co. of California is making a special effort to finish its flying field in Los Angeles. The aerodrome and its equipment is reported to be the finest in the country excepting only those built by the Federal Government. A complete hangar for dirigible airships is being added to the four airplane hangars the company already has on its 80-acre aviation field, part of a 320-acre reservation, adjoining the new plant at the old Ascot race track. The flying field has been loaned to the city and is three-quarters of a mile long by half a mile wide. It will offer every facility for airmen to land and replenish their supplies. While the airship hangar will house any heavier-than-air balloon, it will be largely used for sheltering the new 95-foot "pony blimp" which the company exhibited at the recent San Francisco aero show. The manufacture of such dirigibles on a commercial scale will soon be part of the routine of the company's work. The first "blimp" will be used for the company's dispatches between here and Phoenix, Arizona, the center of the Goodyear cotton plantations.

Nelson & Price, Los Angeles, have taken over the distribution of India tires, made by the India Tire & Rubber Co., Akron, Ohio, for southern California and New Mexico.

The Ideal Rubber Company, formerly at 203 West 50th street, Los Angeles, has removed to 5019 Moneta avenue.

A decided advantage to present and prospective tire manufacturers in Southern California is expected through the operations of the newly-formed International Commerce Corporation, which intends to establish a direct shipping service between Los Angeles and the Dutch East Indies, as well as British India, New Zealand and Australia. The concern is well financed and has already set up agencies in twenty-eight American cities to look after exports and imports.

A concern starting under favorable auspices in the tire-selling line is the newly-incorporated Guasti, House & Giulli, Inc., with handsome salesrooms at 737 Terminal street, Los Angeles. The company has contracted with the Perfection Tire & Rubber Co., Fort Madison, Iowa, for an exceptionally large order of tires, thereby securing the sole agency for California and Arizona.

The officers are: Secondo Guasti, Jr., president; Elliott M. House, vice-president; and Nicola Giulli and William Dahson, treasurer and secretary, respectively.

In addition to F. A. Seiberling, president of The Goodyear Tire & Rubber Company, Akron, Ohio, three other directors of the company are in Los Angeles studying the new plant. They are: George M. Stadelman, chief of sales; F. H. Adams and H. B. Manton. The Goodyear "Flying Squadron" of 110 experts is due in Los Angeles May 15 to give the big concern a proper start. It will be headed by C. R. Langdon. C. C. Slusser, manager of the personnel department, will come to assume the factory management, while Herman Barron of the Akron organization will be California division superintendent.

F. A. Seiberling, president of the Goodyear Tire & Rubber Co., Akron, Ohio, recently spent a week in Los Angeles. He came especially to attend the convention called to urge the development, with Federal aid, of the Colorado river water power project. He also noted with much satisfaction the work being done on the company's mammoth tire plant here and was confident that actual manufacture could be started in June.

F. A. Osterloh, Jr., of the Goodyear Tire & Rubber Co. of California, Los Angeles, has just returned from a month in Phoenix, Arizona, where he was looking after the Goodyear interests in the cotton-growing belt.

The Miller Rubber Co. of California, formerly located on Pico street, has moved to its new home at 1233 South Hope street, Los Angeles, where it is said to have one of the best-equipped tire sales and storage establishments on the Pacific coast.

The J. B. Wood Tire Co., Hewitt tire and tube distributors for southern California and Arizona, is temporarily located at 464 East Third street, Los Angeles, pending the building of its new quarters at Third street and Central avenue.

Work on the forty-acre plant of the Goodyear Textile Mills Co., adjoining the Goodyear Tire & Rubber Co.'s tire plant now in course of erection at Ascot Park, Los Angeles, is progressing so well that the company expects to operate it in July. The textile factory will run 33,000 spindles in making about 150,000 yards of cotton fabric a week, all of which will be taken under contract by the Goodyear tire concern. The latter has covenanted with the textile company to operate a plant that will turn out a minimum of 3,000 tires a day to supply the demand west of the Rockies.

The Los Angeles Horseshoe Tire Co., of which Charles Daley is manager, and which is the sole distributor for the Pacific Rubber Co. here, has moved into new quarters at 1037 South Figueroa street.

Nelson & Price, Inc., has been appointed Los Angeles distributor of the products of the India Tire & Rubber Co., and will be assisted by Bert Mooser.

SAN FRANCISCO NOTES.

Among the speakers at a dinner given by the Advertising Club at the Palace Hotel, San Francisco, recently were A. H. Kroh, Goodyear Tire & Rubber Co.; Barney Oldfield, Oldfield Tire Co.; and C. F. U. Kelly, former president, Kelly-Springfield Tire Co.

The recent big automobile show, the finest ever held in San Francisco, has resulted in greatly stimulating sales of tires and accessories. Every exhibitor reports a quickened state of trade, and all declare the sales prospects for 1920 very encouraging. There were some 80 exhibits of tires, vulcanizers and accessories.

The National Aeronautic Exposition was held in the Exposition Auditorium, San Francisco, April 21-28, 1920.

The Power Rubber Co., San Francisco, distributor of Racine tires for northern California, and of which James E. Power is the head, is erecting a new building. The company has just opened a new salesroom in Fresno, and has branches in Oakland and San José as well as a dealers' organization for other coast cities.

Thomas F. Minchan, who has been in business on Market street, San Francisco, for fourteen years, has been appointed distributor for products of the Lehigh Tire & Rubber Co.

Complete success marked the first annual Pacific Coast Automotive Equipment Exposition which was held in the Civic Auditorium, San Francisco, and which closed on the 4th of April after running a week. Over 5,000 dealers from all parts of the West had exhibits of some sort, and the big eastern concerns were also well represented. One of the striking features was a model tire repair and vulcanizing shop in charge of George Parker, who, with assistants, gave lessons day and night in tire repairing.

The West Coast Rubber Co., San Francisco, of which Charles Williamson is sales manager, has taken the agency for west of the Rockies for the Bonner inner tubes made by the Story Rubber Corporation, of New York City.

A branch of the Braender Rubber & Tire Company, Rutherford, New Jersey, has been opened at 131-133 Eighth street, San Francisco.

NORTHWESTERN NOTES.

Automobile tire dealers in the Pacific Northwest are taking a lively interest in the plans for the great motor caravan wherein delegates from the advertising clubs of that section will move to the place of their annual convention in Stockton, California, on the 23d of May. It is expected that 500 will be in the party, which, it is said, will be the largest that has ever toured over the highways of the Pacific Coast states. L. J. Sparks, manager of the Portland, Oregon, branch of the Firestone Tire & Rubber Co., will have charge of the entries in the "ship-by-truck" class. George Bellis, district manager of The Goodyear Tire & Rubber Co., also of Portland, is general chairman of the program of "stunts" to be put on at various places. The caravan will start May 17 at Vancouver, British Columbia.

The Washington Tire & Rubber Co., Spokane, Washington, which started business in May, 1919, reports gross production to December 31 as \$243,806, representing an average of 51 casings and 59 tubes a day. Production is now running at close to 150 casings and 200 tubes daily, it is said; and a business of \$1,200,000 is expected this year. On March 3, the following officers and trustees were elected: John B. White, president; J. L. Bowling, vice-president; H. S. Burdick, secretary-treasurer; trustees—R. B. Paterson, G. A. Landenbach, J. W. Brett, and Fred B. Grinnell. The sales and advertising department is under the management of W. H. Heylman.

Ray & Smith, of 70 Sixth street, Portland, Oregon, have been appointed state agents for the Sterling Tire Corporation, Rutherford, New Jersey.

The United States Rubber Co.'s new location in Portland, Oregon, is at 111-115 North Sixth street, where its building 100 by 125 feet gives it approximately 75,000 square feet of floor space, of which 5,000 square feet are used for offices, sample and shipping rooms, service department, and mechanical stock. The upper floors are used as stock and storage rooms for tires, tire sundries, footwear, clothing, and druggists' sundries.

E. H. Cummings and P. J. Carson have opened a tire store at Broadway and Flanders street, Portland, and will handle Firestone products.

W. L. Powell, Broadway and Glisan street, Portland, has taken the Multnomah County agency for Hood tires.

The Portland Rubber Mills, Portland, Oregon, were incorporated in the autumn of 1912 with a capital of \$25,000, by J. Spencer Smith, H. C. Huntington and G. C. Frisbie, the capital being increased to \$40,000 four years later. The factory is of concrete, 200 by 75 feet and cost \$100,000. The company manufactures mechanical goods, chiefly valves, gaskets, bumpers, sheet packing, and special molded goods. It specializes in heels

PORTLAND RUBBER MILLS, PORTLAND, OREGON.

and soles, having a capacity of 10,000 pairs of heels per day, with a very large output of soles and taps. This part of the business is confined to the Western States. The company is also the northwestern representative of the Manhattan Rubber Manufacturing Co., Passaic, New Jersey, and also does an extensive jobbing business with the saw mill trade. H. C. Huntington has been president and general manager of the company from the start.

F. L. Hawley has been made sales manager for the Pacific Tire & Rubber Co., Portland distributor of Blackstone fabric and Canton cord tires. R. Jansberg and C. H. Kepler have joined the sales force.

CANADIAN NOTES.

R. Jeffers has been appointed vice-president and manager of the Firestone Tire & Rubber Company of Canada, Limited, Hamilton, Ontario.

The Bergougnan Rubber Corporation, Trenton, New Jersey, U. S. A., some months ago opened a branch at 496 Yonge street, Toronto, Ontario, in charge of William A. Shaw as manager for the Province of Ontario.

The Rubberset Company, Newark, New Jersey, U. S. A., which established a manufacturing plant in Toronto, Ontario, about four years ago, to supply the Canadian trade demand for "Rubberset" brushes, has acquired a wood-working factory at Gravenhurst, Ontario, to meet its requirements in the way of handles for various kinds of brushes. Suitable machinery will be installed and about fifty people will be employed. Any surplus production will be used in the Newark factory. The company's Canadian branch now employs about 100 people and has established general distribution of its product throughout Canada.

The Lion Tire & Rubber Co., 502 Kent Building, Toronto, Ontario, has been recently incorporated under the laws of that province to manufacture cord tires and other rubber products. A factory site of more than five acres has been purchased in New Toronto, about five miles west of Toronto, where the first factory unit will be built at an estimated cost of \$500,000. It is expected that manufacturing will begin about March, 1921. The company is capitalized at \$2,500,000 common stock, par value \$10 per share. It has also been granted a bond issue of \$750,000, but does not plan to avail itself of this at present.

William Fifield has recently taken charge of the automobile inner tube production of Ames Holden McCready Co., Montreal, Quebec.

BILLIARD ACCESSORIES OF RUBBER.

NOT CONTENT with supplying the greatest improvement ever made in billiards—the resilient ledge or elastic cushion surrounding the slate bed of the table, the one feature which has made the modern game possible—India rubber has provided devotees of the game with numerous accessories, most of which are quite indispensable. Not the least of these is the rubber-backed cloth which is largely replacing the old-time broadcloth. This cloth is now made in America and equals the best produced in Europe. It has a fine, close weave, with nap and finish to suit the most critical player, and it is made in various thicknesses to suit the different types of tables, as well as being woven to three sizes of beds. Even special care has been taken in dyeing in order to produce not only the standard blue-green color easy for the eyes under electric light, but also giving an effect that will harmonize with modern room-lighting. This material costs somewhat more than the old-fashioned billiard cloth, but this is more than offset, it is said, by its remarkably long wear. Moreover, skillful players note a decided advantage in having a slight cushion between the slate and the cloth. They say that with it shots can be made with much more accuracy than on the old, deader surface.

RUBBER CUE GRIPS.

To keep cues from slipping, the butts have been covered with cork, leather, twine, and silk and cotton braid, but players have

able hard rubber markers. The latter are also used now on marker stands and frames, preferred by many to the old and often unhandy overhead counting device.

HARD RUBBER TRIANGLES

With the passing of the old "pool room," to which more or less odium was attached, has come the "pocket billiards parlor." Here again rubber serves the players' needs in providing ebony triangles to take the place of the maple ones so long used to arrange the fifteen balls in a pyramid. The hard rubber triangles have extra strong reinforced corners and users find they stand harder handling than the wooden contrivances.

RUBBER CEMENTS.

One of the least costly and most useful articles to the billiardist is rubber cement for attaching cue tips, etc. This article is put up in small tubes, and is much superior to glue preparations. Many players who want quick repairs find much satisfaction in using rubber cemented cue tips, which can be had in every size.

POCKET NET RINGS.

Pocket nets now have rubber rings instead of wood to lessen noise and ease the fall of balls. Careful players find that this simple precaution adds to the life of the balls and helps to keep them true.

RUBBER CHALK HOLDERS.

Much satisfaction is derived by knights of the cue from the rubber chalk receptacles. These holders are made in the round

HARD AND SOFT RUBBER SPECIALTIES THAT ARE INDISPENSABLE IN BILLIARDS.

found an excellent substitute for all these in a rubber cue grip, or sleeve, nine inches long, which will quickly transform any common cue into a perfectly non-slippable one.

RUBBER NOISE SUBDUERS.

The annoyance of cues bumping on floors is now easily overcome with rubber noise-subduers, one style being made with a nail attachment and a larger one, with an opening for a countersunk screw.

RUBBER TABLE COVERS.

Rubber-coated table covers are largely used now instead of oilcloth covers, as the paint-like coating on the latter soon cracks in handling and exposes the thin fabric through which dampness in inclement weather reaches the tightly stretched cloth on the table bed. This cloth readily absorbs moisture, offering greater resistance to the cue ball and requiring more force to drive it to an objective point.

HARD RUBBER BALLS.

Billiard balls of hard rubber are now being used instead of the more expensive ivory spheres. An infinite number of tests have proved them not only much livelier but also much more durable than the old-style composition balls.

BILLIARD MARKERS OF RUBBER.

In up-to-date billiard rooms wooden buttons suspended on a wire above the table are giving way to the neater and indestruct-

ible hard rubber markers. The latter are also used now on marker stands and frames, preferred by many to the old and often unhandy overhead counting device.

FOR BALL RETURN.

Among the drawbacks of the original ball return device used beneath the table for pocket billiards were the noisy troughs or runways. Here again rubber proved to be a boon. It was placed in the troughs and all click and clatter ceased as the balls were holed and guided to the receptacle at the end of the table.

CORRUGATED MATTING.

A strong demand has developed for corrugated rubber matting beneath and around billiard tables. Not only are the looks of the table improved with such floor covering, but the firm yet elastic surface of the matting adds much to the comfort of players and lessens fatigue in long games. The ribbed matting is $\frac{1}{4}$ -inch thick and mitered at corners. It is made in nine sizes.

OTHER RUBBER SUPPLIES.

Other accessories in rubber include cushion packing facings for pocket openings in sets of twelve, tubing for cue roque table posts, and corrugated rubber mats for cuspidors.

THE RUBBER ASSOCIATION OF THE BRITISH RUBBER TIRE Manufacturers has elected B. D. Porritt as its director.

Activities of The Rubber Association of America.

EXECUTIVE COMMITTEE TIRE MANUFACTURERS' DIVISION.

THE REGULAR APRIL MEETING of the Executive Committee of the Tire Manufacturers' Division, held in the Association rooms April 21, was well attended. Particular interest centered about the discussion of the subject of establishing minimum and maximum cross section widths for pneumatic tires, and to enable the subject to be thoroughly covered in both its commercial and technical phases, a conference had been arranged by the Executive Tire Committee with the Executive Committee of the Tire and Rim Division of the Society of Automotive Engineers. A lengthy discussion of several suggestions respecting the way in which to accomplish this end which seems to be the desire of all manufacturers, resulted in no definite recommendation and the subject was given to a special sub-committee appointed at the meeting, that will make a detailed study and report to the Tire Executive Committee at its next meeting. Several matters of a routine nature were also given attention by the Executive Committee.

MECHANICAL RUBBER GOODS SPECIFICATION COMMITTEE.

On April 2 there was held in the association rooms a meeting of the Mechanical Rubber Goods Specification Committee at which a large number of subjects connected with the negotiations of the Specification Committee with users of specification mechanical rubber goods was handled.

The work on these problems was principally of a routine nature, but definite conclusions were reached with respect to some matters, principal among which is the decision to recommend to all manufacturers of mechanical rubber goods that bids on M. C. B. air brake hose be confined to the 1913 M. C. B. Specifications as last amended by the Manual of Standard and Recommended Practice of the Master Car Builders' Association, for 1919. It is to be understood distinctly, however, that the foregoing has no application to car signal hose which may be furnished to a railroad's individual or any other specifications.

The committee felt also with respect to the matter of inspection and tests for rejection of specification mechanical rubber goods, that it should recommend to manufacturers that the period for acceptance or rejection, upon test, shall be limited to 60 days from date of shipment. In this connection it was also decided to recommend further to manufacturers, that all specification rubber goods be tested for acceptance or rejection at the point of manufacture. It is planned for the Specification Committee to hold its next meeting in Asbury Park during the week of June 22.

UNIFORM BASIS FOR COMPUTING EXTRA CHARGE FOR MAKING RUBBER BELTS ENDLESS.

Some time ago the Executive Committee of the Mechanical Rubber Goods Manufacturers' Division recommended to belting manufacturers that they adopt a uniform basis for computing the extra charge for making belts endless, which has been very generally in effect, on the following basis:

For belting under 12 inches in width, 6 additional feet.

For belting 12 inches or more in width, 8 additional feet.

Recent examination of the file on this subject indicates that acknowledgments from all interested companies approving the recommendation of the Executive Committee have been received and manufacturers have been so advised. This should insure uniform conditions in the rubber belting manufacturing business in this connection.

FUNDAMENTAL PRINCIPLES RELATING TO INDUSTRIAL RELATIONS.

New York, April 14, 1920.

To firm and affiliated members:

Please refer to our Circular Letter G-43 of March 19, announce-

ing the distribution by the Republican National Committee, through its Advisory Committee on Policies and Platform, of a questionnaire on industrial relations and the problems of capital and labor. At that time we advised that because of the broad questions of industrial relations policy and practice involved, the Industrial Relations Executive Committee of this Association would give consideration to the specific questions set forth in the questionnaire with a view of making an analysis upon which it might predicate helpful information and suggestions to be offered to our members for consideration by them in connection with the questionnaire.

The Industrial Relations Executive Committee of the Association recently met and made an exhaustive examination and study of the questions presented in the questionnaire, and we are sending you with this letter a pamphlet entitled "Industrial Relations," in which there is set forth all of the questions contained in the Republican National Committee's questionnaire and there is shown in italics the views held by our Industrial Relations Executive Committee.

The committee wishes to be clearly understood respecting its purpose in making an analysis of the questionnaire. It desires to place particular emphasis on the fact that the political origin or purpose of the questionnaire had no place in the consideration of this matter and that it is not sent to you as an aid to political thought or action, but is intended to be non-partisan and non-political and is presented for the single purpose of offering to our members the benefit of the conclusions of experienced and practical minds in our industry who are giving all their time and energy to one of the most important problems in industry, namely, industrial relations.

The Republican National Committee's questionnaire presented questions respecting industrial relations which include nearly the whole range of fundamental principles relating to this important problem of our industrial life and had these questions originated with another political party or with other representative and responsible sources that would insure a wide distribution, our Committee would have felt that it was not meeting its duty if it did not attempt a conservative analysis for the purpose of offering assistance to the membership of this Association.

There is no doubt that each of the principles connected with the questions and suggested answers set forth in the attached pamphlet would have received attention by your Industrial Relations Committee in due course and it is perhaps fortunate that so complete an analysis of these primary principles of Industrial Relations can be made at this time in order that our members may clearly understand the viewpoint of the Industrial Relations Executive Committee which is predicated on the broad experience of its members in industrial relations work in the rubber industry.

The Committee hopes that its suggested answers to the questions set forth in the Republican National Committee's questionnaire may be of some assistance to those of our members who desire to respond to the questionnaire, but the primary purpose of distributing the attached pamphlet is to suggest to our members basic principles for conducting industrial relations work and to indicate the composite opinion of your Industrial Relations Executive Committee respecting those principles.

A. L. VILES, General Manager.

ANNOUNCEMENT BULLETIN AND INFORMATIVE SERVICE.

New York, April 22, 1920.

To firm and affiliated members:

This is the first of the bulletins which members of this Association will receive under an extension of the bulletin service heretofore conducted by this office to a limited extent through

the medium of circular letters.

Distinctive bulletin forms printed in colored inks will be used to cover the dissemination of information for the present under the following classifications:

General information,
Traffic information,
Legislative information,
Industrial relations information.
Bureau for the exchange of mill information (surplus new and second-hand material and equipment for sale and purchase).

The bulletins of each class will be numbered consecutively and will be issued as frequently as is necessary.

May we not suggest that provision be made in your office for filing these bulletins according to the classification indicated, thus building a convenient means of reference to the information emanating from the Rubber Association. An index to the numbered bulletins will be issued at frequent intervals, to expedite reference to them.

A. L. VILES, General Manager.

PERSONNEL OF ASSOCIATION STAFF.

New York, April 26, 1920.

To members:

The following promotions in the staff of the Association, effective as of April 1, have been approved by the Board of Directors:

Harvey Willson, formerly assistant secretary and office manager, is promoted to the newly created position of assistant general manager.

R. H. Goebel, formerly assistant to the manager of the traffic department, is appointed manager of the traffic department.

A. L. VILES, General Manager.

NEWS TICKET SERVICE FOR THE RUBBER TRADE.

The Export and Import News Bureau, 24 Moore street, New York City, which several months ago began the operation of a foreign trade news ticker, will shortly establish a separate ticker unit devoted exclusively to the rubber trade. The Bureau will have daily cables from London, Singapore, Colombo, Batavia and other foreign markets. Consular and trade representative reports as well as other Washington news, legislative and administrative, of interest to the trade will be secured by private wire from the Bureau's Washington office. Imports at the port of New York in detail as well as steamship arrivals will be promptly bulletined.

The New York market on crude rubber of all grades, spot and future delivery, will be covered both by quotations and by bids and offers of subscribers for the ticker service. Over forty rubber dealers, brokers and importers have contracted for the service and are given the privilege of telephoning in at any time during the day to have announced on the ticker what they want to buy or sell. The subscriber does not have to use his name unless he chooses, as he can have assigned to him an office designation, as X-27 and then all replies coming to the office of the Bureau are promptly telephoned him.

The foreign exchange market will be covered very comprehensively. Continuous quotations on cable sterling will be published and twice each day, at noon and closing, the prices, never published heretofore, will be given on forward sterling by months, for nine months in the future.

An interesting feature of the Bureau's foreign quotations on crude rubber will be their translation into New York parity at the current rate of exchange. For example, if crepe is quoted in London at 26d. and cables are £3.97, the announcement on the ticker would be, "London 1 p. m., crepe, 26d., New York parity 43 cents."

To serve out-of-town subscribers as well as those in New York, quotations, bids, and offers of fabrics and chemicals used by rubber manufacturers will be published. To the out-of-town

subscribers the Bureau will send telegrams as often as there is any change in the market, covering both the New York quotations and foreign cables as received, and the out-of-town subscriber by using the wire can have his announcements made on the ticker as well as the New York subscriber.

THE ADVERTISING MANAGERS' COUNCIL.

More than fifty representative advertising managers of the automotive industries attended a meeting at the Hotel Commodore, New York City, March 26, 1920, under the auspices of the Motor and Accessory Manufacturers' Association, and approved plans for the organization of an advertising managers' council, as a central clearing house to handle constructive cooperative work on vital problems of mutual interest.

Among those present were: E. C. Tibbitts, advertising manager, The B. T. Goodrich Co., Akron, Ohio; M. S. Connelly, advertising manager, Hood Rubber Products Co., Waverlytown, Massachusetts; M. F. Judd, sales manager, R. B. Davis, district manager, and J. E. Elliott, Raybestos Co., Bridgeport, Connecticut; George B. Hendrick, publicity manager, The Fisk Rubber Co., Chicopee Falls, Massachusetts; H. B. Joseph, assistant advertising manager, and H. R. Hurd, manager copy division, Kelly-Springfield Tire Co., New York City; L. L. King, advertising manager, The Goodyear Tire & Rubber Co., Akron, Ohio, and J. C. McQuiston, advertising manager, Westinghouse Electric & Manufacturing Co., New York City.

At the luncheon which preceded the executive session of the conference, addresses were delivered by Richard H. Lee, special counsel of the Associated Advertising Clubs of the World, and David Beecroft, directing editor, Class Journal publications.

E. C. Tibbitts, advertising manager, The B. F. Goodrich Co., Akron, Ohio, pleaded for a broader vision by advertising men in meeting the complex and crucial problems facing America. It is the special privilege and duty of advertising men, he said, to render patriotic service of the most vital importance by supporting the various movements for Americanization, greater production, and better roads and transportation. He urged the advertising managers to think, not only of their own particular problems in marketing and selling their products, but also to enlist their talents and their services in the interest of the larger national movements. This can best be done, he said, through concerted action and team-work.

S. A. E. SUMMER MEETING.

The Society of Automotive Engineers will hold its summer meeting this year at Ottawa Beach on Lake Michigan, June 21 to June 25 inclusive. The Ottawa Beach Hotel and the Waukazoo Inn have been engaged for the members, and arrangements have been made for the accommodation of ladies. There will be daily lectures and business meetings, a program of sports spread over three days, and a grand ball on Thursday, June 24. Ottawa Beach is at the junction of Black Lake with Lake Michigan, six miles from Holland, Michigan, and can be reached from Chicago by boat and by train.

RUBBER GOODS BOUGHT BY THE QUARTERMASTER'S DEPARTMENT.

In the year and a half since June 1, 1918, the General Supplies Branch of the Quartermaster General's office has bought the following rubber goods:

Rubber bands, 6,096 pounds, @ \$1.1308 per pound.....	\$7,572.50
Rubber erasers, 25,336, @ \$0.0001 each.....	307.02
Rubber matting, 864 yards, @ \$1.017 per yard.....	878.99
Cuspidor mats, 1,500, @ \$0.245 each.....	368.75
Floor mats, 11, @ \$20.5175 each.....	8.07
Treads for stairs, 90 pieces, @ \$0.751 per piece.....	67.60
Finger cots, 250 dozen, @ \$0.42 per dozen.....	105.00
Rubber tyre, 100 sets, @ \$0.65 each.....	65.00
Total.....	\$9,616.93

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

BUSINESS in practically all departments of the trade continues to be brisk enough as far as the order book is concerned. This, however, does not mean that everything is proceeding smoothly and that there are no worries to contend with. In fact, if all troubles were enumerated it would form a long list, what with labor demands for higher wages and shorter hours, the rise in the price of textiles, transport difficulties, etc., to say nothing of the impending levy on war wealth. Judging by resolutions recently adopted by certain workers' unions it would seem that the day wage in most industries will be replaced by the piece-work system. This should tend to increase output, which on the day wage system usually remains at the level of the slowest worker.

This year has been remarkable for the appeal to the public to invest in all sorts of industrial concerns which, owing to the increased expense of commodities and wages, require a larger capital to carry on. To date—the middle of March—there has been an issue of about one hundred millions, of which about fourteen million pounds was for the rubber trade, including eight millions issued by the Dunlop Rubber Co., Limited. Underwriting has been easy to obtain as the public seems prepared to go in for everything which offers. This pace, however, cannot be kept up and we may expect to see a considerable slowing down.

THE PROOFING TRADE.

The use of coal tar products as petrol substitutes is on the increase, owing to the rise in price of petrol, and the solvent naphtha position is causing perturbation in the minds of proofers. So far, not much has been done in the way of installing recovery plants, but engineers are quite alive to the possibilities in this direction and a good many specifications are now before proofing firms. Of course the initial expense is now somewhat heavy and, moreover, specifications and estimates are not worth much nowadays, as they all contain clauses to the effect that extra may have to be charged if materials and labor go up before the work is completed. However, the matter of the installation of recovery plants is receiving more serious attention now than has ever been the case in the history of the proofing trade.

Now that business has got back into normal channels there is plenty of competition for the work given out and proofers are not finding it too easy to get customers to agree to the high prices now ruling on account of the increased costs of materials, except rubber. Many firms are still busy on old contracts, and where they have covered themselves for cloth they are all right and are, of course, in a very good position if they have excess cloth in stock at old prices. Those who have to buy their cloth at to-day's prices can only compete with the utmost economy in other directions, hence they do not turn a deaf ear to the advocates of naphtha recovery. The rain coat business is decidedly flat and in some cases where there is a stock of cloth rain-proofed but not cut up, it is being turned over to the proofers to be rubbered where they are found willing to take the business on.

DETERMINATION OF SUBSTITUTE IN RUBBER.

A communication on this subject has recently been published by P. Dekker, of the Netherlands Government Rubber Institute, at Delft. There will be many rubber analysts who will agree with his statement that the determination is by no means so easy as is often supposed. One cause is the incomplete abstraction of the substitute by alcoholic potash, and another is the fact that substitutes have varying composition, this being more

pronounced to-day than it was ten or twenty years ago. It should be noted that the alcoholic potash extraction test, as laid down in British Government specifications, is not a process for the estimation of substitute so much as the determination of organic matter not rubber, and as the acetone extract is also taken into account it does not matter if 50 per cent of the substitute goes into the acetone extract. In the case, however, of a commercial analysis, where the object is to ascertain the amount of substitute used, the proportion soluble in acetone is of prime importance. No recognized correction can be made for this, as the amount soluble in acetone varies within such wide limits. Especially is this the case with brown substitutes containing non-oily matters, such as paraffine wax. Mr. Dekker experimented with a brown substitute containing 38 per cent soluble in acetone. In my experience the figure has varied from 15 to as high as 70 per cent, though the latter figure may be considered as exceptional.

An interesting part of the paper refers to the determination of substitute in the presence of asphalt, and it is shown that the varying amounts of asphalt dissolved by acetone and alcoholic potash entirely vitiate any attempt to gage the amount of substitute dissolved by the same solvent and the author comes to the conclusion that the determination of substitute is not feasible in rubber compounds containing asphalt. As the two are but rarely to be found in the same rubber compound, the matter is not of great importance.

The method he advocates for determining substitute in rubber is to add to the alcoholic potash extract the acetone extract minus rubber resins and sulphur, and to call the combined extract substitute. The chief drawback to this conclusion seems to be in the fact that where paraffine wax is present it is impossible to say whether it was used in addition to the ordinary quality substitute or whether it formed a component part of the substitute. Of course, if only the fatty acid, dissolved by alcoholic potash and the fatty portion of the acetone extract are added together and returned as substitute, a correct figure is obtained for substitute as commonly understood, but not necessarily for the commercial substitute as used by the rubber manufacturer in his formula.

PEACHEY'S NEW VULCANIZATION PROCESS.

Peachey's process has been patented for most parts of the world, the British patent being No. 129,826,¹ and its exploitation is in progress by strong financial interests in England. It certainly does not lack the element of novelty as so many rubber patents do, and its advent cannot fail to excite great interest among rubber chemists and manufacturers. Stated briefly, the vulcanization is effected by sulphur without the aid of heat, and therefore certain organic fillers and a wide range of coloring matters, the use of which has hitherto been barred, may be utilized in vulcanized rubber goods. The sulphur is got into the rubber by employing the well-known inter-action of sulphureted hydrogen and sulphur dioxide gases, which leads to the formation of free sulphur. Rather surprisingly, this sulphur acts upon the rubber to vulcanize it in the cold. If a solution, say a 10 per cent solution of raw rubber in benzene, is saturated with sulphur dioxide and is then mixed with another similar solution saturated with sulphureted hydrogen, a jelly is formed after the lapse of a short time and on evaporation of the solvent the rubber is found to be well vulcanized.

¹This patent was briefly described under "Chemical Patents" in THE INDIA RUBBER WORLD, November 1, 1919, page 86.

This is the main outline of the reaction without reference to certain details which must be attended to in order to produce a uniform rubber. The process obviously opens up a vista of possibilities in one branch or another of the rubber trade. One branch which is very much to the fore at the moment is the production of compound rubber soles for boots, and here, I am credibly informed, some very good and quite cheap material has been turned out by aid of the new vulcanizing process. Moreover, the soling material already cold cured is readily vulcanized on the boot by means of the rubber solution with the mixed gases in it, thus obviating the use of nails. There would certainly seem a wide and useful field for the process in connection with the use of organic materials such as sawdust in cheap mixings or in utilizing the process in bodies such as linoleum, where the presence of a little vulcanized rubber might well be expected to be of benefit and where the employment of the ordinary hot sulphur cure would be out of the question.

It will be interesting to watch the development of a vulcanizing process which may fairly be considered the only one which has any serious claim to consideration since the distant date of 1846 when Parkes brought out the present-day cold cure process. It is somewhat unfortunate that it seems to be the fate of cold-cure processes to be concerned with atmospheres which—well, are not in the same street with attar of roses, but still a new smell in a rubber works will not suffice in itself to destroy interest in a process which has merit behind it, and really, as far as I know, the smell vulgarly associated with election eggs may not make itself evident to the senses.

TIRES FOR TRUCKS.

A development which is attracting a good deal of attention has to do with the extended use of pneumatic tires on heavy commercial vehicles. At present from the two-ton vehicle upward the solid tire is practically the standard. There is an insistent demand, however, in many classes of traffic for freedom from road shocks, and there is also a call for less damage to the roads, and because the pneumatic tire is the best shock absorber it is felt that its upward development into the region of the heavier commercial vehicle is bound to materialize. The big pneumatic is not now entirely a novelty because it has been put to practical test in aviation, for the landing wheels of the giant airplanes used in the war. Personally I have made acquaintance with these tires only on the rubber reclaimer's premises, but it is understood that the special plant which turned them out is still in existence, although the specialized demand has ceased. Should a new demand arise in connection with commercial vehicles, no doubt the supply would soon be forthcoming. Meanwhile the number of rubber firms putting solid tires on the market continues to increase.

BRITISH RUBBER EXHIBITION—1921.

The Fifth International Exhibition of Rubber, Other Tropical Products and Allied Industries will be held at the Royal Agricultural Hall in London, June 3 to June 17, 1921. The organizing manager is H. Greville Montgomery, formerly Member of Parliament for the Bridgewater division, of Somerset, who takes the place of the lamented A. Staines Manders, the founder of these exhibitions. Sir Owen Philipps, G.C.M.G., M.P., will be honorary president and Prof. Wyndham R. Dunstan, LL.D., F.R.S., director of the Imperial Institute, honorary vice-president; Miss D. Fulton, secretary of the late Mr. Manders, and Miss Edith Browne, F.R.G.S., are interested in the enterprise. On the Executive Committee are Dr. Joseph Torrey, who will again act as chairman of the congress; the Right Honorable Lord Leverhulme; Sir Harry Wilson; Sir Daniel Morris, D.C.L., D.Sc.; Sir Francis Watts, D.Sc., and others prominent in the rubber industries. The advisory council is drawn from officials in all tropical countries.

The offices of the organization are at 43 Essex street, Strand, London, W.C.2.

PROWODNIK REPORTED TAKEN OVER BY BRITISH CAPITAL.

In the rush to secure Russian markets British capital is anticipating peace settlements and the recognition of whatever government Russia may have, and has already invaded the new countries that have been formed from former Russian territory, Latvia, Lithuania and Estonia. A powerful British group of capitalists is reported to have made arrangements with the authorities in these lands to handle their natural resources and industries. Among these it will reconstruct at once the works of the Prowodnik at Riga.

The Prowodnik, the full name of which is "The Prowodnik Russian-French India Rubber, Gutta Percha & Telegraph Works," was the largest rubber goods factory in Russia, and came into existence about 1889, French capital being employed. In 1916 when the German advance brought about its removal to Moscow, the company had a capital of fifty million rubles; its plant covered 3,000,000 square meters of ground; it used 20,000 horsepower in its engines; and the number of employes was 18,000. It made every kind of rubber goods, turning out 1,000 tires and 100,000 pairs of rubber shoes a day and doing 65,000,000 rubles worth of business a year.

The removal of the plant to Moscow was regarded as a wonderful feat of efficiency. Reports came at that time that the company had been nationalized, together with the other great company, the Treigolnik or Russian-American which, with it, monopolized the Russian rubber trade and, before the war, was mainly run by German capital. It is the plant abandoned in 1916 that the British capitalists are said to have taken over.

TARIFF REGULATIONS AND CHANGES.

Greece proposes to put a duty on "metallic wires covered with rubber or gutta percha," at the rate of 10 drachmas per 100 oaks or 19.2 cents on 280 pounds.

Brazil imposes an export duty of 3 per cent ad valorem on rubber exported after June 1, 1920.

Latvia imposes duties of 5 per cent ad valorem on crude rubber and of 15 per cent on manufactured rubber goods.

Persia imposes duties of 12 per cent ad valorem on rubber manufactures.

Switzerland intends to exact duties of one franc on a hundred kilos of crude or waste rubber or gutta percha and of five francs per hundred kilos on threads of rubber for elastic tissue, which have heretofore been admitted free of duty.

According to the proclamation in the "Reichsanzeiger" of March 6, 1920, no license is required for the importation into Germany of india rubber, raw or purified; gutta percha, raw or purified; balata, raw or purified; india rubber, gutta percha and balata waste; waste wares of india rubber, gutta percha and balata.

Switzerland exacts no individual export license since February 20, 1920, for rubber and gutta percha in bands, sheets, plates, plugs, molded articles, threads, balls, rods, etc., without internal layers of metals or tissues; plates, rings, strips, etc. of rubber, with internal layers of metal or tissues.

From October 20, 1920, for gummed fabrics of rubber for industrial use, rubber fabrics for cards, cylinder covers for printing, insulating materials of rubber; rubbered fabrics (double stuffs) for cart tilts, etc.; elastic tissues of all kinds, of rubber combined with cotton, wool, silk, etc.; rubber or gutta percha applied on tissues or other materials; waterproof sheeting, rubbered on one or both sides.

On the other hand the General Export License has been abrogated for mechanical stoppers of all kinds of bottles, including those combined with rubber.

ITALY'S RUBBER INDUSTRY.

By H. C. MacLean, in "Commerce Reports."

ITALY has built up a flourishing industry in the manufacture of rubber goods, although the number of firms engaged in this line of activity is not large. The first steps toward the establishment of this industry were taken in 1872 by G. B. Pirelli, and the progress made is very creditable, considering the technical character of the industry and Italy's deficiencies in the matter of coal, gasoline, etc. There are at present in Italy 13 firms engaged in the production of rubber goods and insulated electric wire and cables, which give employment to about 20,000 persons. During the past year these firms organized the *Associazione fra gli Industriali della Gomma, Conduttori Elettrici, ed Affini*, believing that they had certain interests in common which such an association could promote.

LARGE INCREASE IN IMPORTS OF CRUDE RUBBER.

The statistics covering Italian imports of crude rubber for the past 10 years show the extent to which the rubber industry has developed. The war created an exceptional demand for rubber goods. The consumption of crude rubber in 1918 was approximately five times as great as in 1909 and more than double that of 1914, the year the war broke out.

Crude-rubber imports for the years 1909-1918, inclusive, were as follows (one lire = \$0.193):

Years.	Value. Lire.	Years.	Value. Lire.
1909.....	1,567 20,376,000	1914.....	3,054 21,378,000
1910.....	1,878 31,960,000	1915.....	5,367 42,938,000
1911.....	2,419 30,249,000	1916.....	5,320 47,878,000
1912.....	3,494 38,438,000	1917.....	6,127 67,399,000
1913.....	2,844 25,599,000	1918.....	7,545 83,000,000

PRINCIPAL ITALIAN RUBBER GOODS MANUFACTURING COMPANY.

Italy manufactures rubber goods of practically every variety, including tires, mechanical rubber goods, hard-rubber goods, druggists' sundries and other specialties, rubberized textiles, and

WORKS OF PIRELLI & CO., MILAN, ITALY.

insulated wire and cables. The firm of Pirelli & Co., whose head office is in Milan, is by far the largest manufacturer in this line. This company has a capital of 40,000,000 lire, and, in addition to its three plants in Italy, has also additional plants in Spain, England, and Argentina. During the year 1917 its Italian production was valued at 165,000,000 lire, which was an increase of about 80 per cent over that of the preceding year. While making a wide variety of articles, the most important products of the Pirelli company are pneumatic and solid tires and electric wire and cables, in which a considerable foreign business has been built up. Its foreign establishments are engaged principally in the manufacture of electrical conductors, including submarine cables, in which line this firm has been able to compete successfully with the large manufacturers of other nations. In addition to Pirelli & Co., other establishments of considerable importance are working along similar lines.

WAR-TIME DECLINE IN EXPORTS OF RUBBER GOODS.

Italy's imports of rubber goods have remained more or less stationary for a number of years, although during the last years

of the war a considerable reduction took place. On the other hand, exports steadily increased until, in 1915, they were about two and a half times greater than the imports. After Italy's entrance into the war in that year the domestic demand was such that exports were greatly reduced, in spite of the large increase in production. As conditions become normal again there is reason to expect that exports will again increase, especially in the case of pneumatic tires, as this Italian product has won considerable popularity abroad. Statistics covering Italy's total imports and exports of rubber goods for the period 1909-1918 follow:

Years.	Imports. Lire.	Exports. Lire.	Years.	Imports. Lire.	Exports. Lire.
1909.....	33,111,000	21,406,685	1914.....	27,464,000	58,106,000
1910.....	44,247,000	30,074,750	1915.....	36,460,000	87,514,000
1911.....	33,670,000	26,025,000	1916.....	33,042,000	46,944,000
1912.....	30,397,000	58,424,000	1917.....	22,281,000	23,986,000

IMPORTS AND EXPORTS OF RUBBER GOODS FOR FIRST SIX MONTHS OF 1919.

From the figures for the first six months of 1919 an idea can be gained of the character of the rubber and rubber goods imported and exported by Italy. Unfortunately, the largest increase in imports is shown in the case of "other rubber products not specified," and there is no means of ascertaining what commodities are included under that head. On the side of exports, the most important item is pneumatic tires, where the 1919 figures are more than double those of the previous year, and exceed imports by about 4,000,000 lire. Statistics covering insulated wire are not available. The detailed figures of imports and exports of rubber and rubber goods for the first six months of 1919 are given below:

Articles.	Imports.		Exports.	
	Quantity.	Lire.	Quantity.	Lire.
Rubber and gutta percha, crude and reclaimed.....	7,048	67,274,550	362	1,316,800
Scrap.....	944	1,545,120	11	12,000
Rubber and gutta percha in:				
Threads.....	16	395,200	13	486,000
Sheets.....	10	161,600	5	93,000
Tubes.....	9	115,100	53	521,000
Belting.....	27	454,400	10	153,000
Rubberized textiles in the piece.....	37	88,500	10	117,600
Rubber shoes.....	1,427	194,700
Garments and traveling equipment.....	27	691,600	33	1,089,000
pounds.....	440	6,400	880	19,200
Manufactures of rubber:

Rubber goods not specified.....	870	11,866,500	87	1,107,400

CHICLE IMPORTS FOR 1919.

The import trade in chicle increased greatly in quantity as well as value in the first year of peace, according to Commerce Reports. Mexico, the chief source, shows a gain in quantity of 1,891,307 pounds in 1919 over 1918 and in value of \$1,791,107, while the other chicle countries show smaller gains. The average value per pound rose from 37 cents in 1914 to 65.8 cents in 1919, about 78 per cent in six years. The increase from the 52.6 cents per pound of 1918 was 25 per cent. The average import prices paid per pound in 1919, by countries, were: Canada \$1.24, British Honduras \$0.675, Mexico \$0.74, Colombia \$0.321, and Venezuela \$0.285.

SUBSTITUTE FOR CHICLE.

The latex of the *Galactodendron utile*, a tree of Colombia, was examined by M. T. Dawe, of the London Imperial Institute, who found, after drying it, that it contained 90.8 per cent resin, 3.1 per cent impurities and 6.1 per cent gutta. The last was very soft and plastic. The substance is too friable and resinous to be used as balata or gutta percha are, but it strongly resembles pontianak. The latex differs from chicle because it contains more resin and less gutta, but it could easily be used for chewing gum, as it is pale in color, is free from bark and mineral matter, and becomes more plastic when it is chewed.

Rubber Plantations in Kamerun.

By Alfred Dominikus.

IT CANNOT BE DENIED that the Germans, in so far as conditions permitted, did their best to further the cultivation of rubber in their former African colonies which were taken away from them by the war, but that on the other hand, many disastrous mistakes and errors were made which prevented the expected successful results from the work. Consider for example, former German East Africa. Since the ground was not suitable for *Hevea brasiliensis*, the Ceara rubber tree (*Manihot glaziovii*) was cultivated in this district, but it cannot be said to-day that

about fifteen years old gave on the average in the course of three years seven pounds of rubber per tree and per year. And what were the results of this Kamerun *Kickxia* fever?

Information on this is given in an article by Heinrich Picht in the "Tropenpflanzer" for January and February, 1920, on the prospects of profits from some Kamerun plantations. As remarked above, and as Picht states in the introduction to his article, the *Kickxia* cultivation in Kamerun was taken up at the time with great hopes. From the quality of the rubber obtained

(West African Plantation Co., "Bibundi," Kamerun.)

FIVE-YEAR HEVEA BRASILIENSIS.

MANIHOT GLAZIOVII.

SIX AND ONE-HALF-YEAR KICKXIA.

there was any special success in the cultivation which some years ago was stigmatized scientifically as a distinct mistake.

The English, who are masters of the colony they now call Tanganyika—that is to say, English companies such as East African Plantations, Lewa Rubber Estates, Kamna Rubber Estate, and the Muhesa Rubber Plantations—at the time of the rubber boom, with its deep shadows, took over the best *Manihot* plantations of what was then German East Africa without obtaining any better results.

A still more manifest failure can be recorded regarding the *Kickxia* (*Funtumia elastica*) plantations in Kamerun. When Dr. Schlechter, on the basis of the results from his West African rubber tree (1899-1900), praised the agricultural value of the *Kickxia* in the highest terms, designated the cultivation of this species as "extraordinarily profitable" and recommended it, especially for West Africa, "since it is native to the country, and therefore surely seems to offer better prospects for success than the various rubber trees of other portions of the world," it naturally resulted that the work of cultivating the native African rubber tree should be eagerly taken up in former German Kamerun. Dr. Schlechter had stated that a tree seven years old had given 3,400 cubic centimeters of latex, out of which 2,000 grams of rubber were obtained; also that trees not yet six years old had yielded 140 to 170 grams of dry rubber, from which he inferred that the trees could be tapped four times a year, and perhaps even more frequently with similar results. It was said in the prospectus for a plantation scheme, that *Kickxias*

and the reports of professed scientific men on the results, these hopes seemed to be thoroughly justified. Yet hardly any such tropical culture has brought on the bitter disillusion that *Kickxia* has! The author gives proof of this plainly from more definite statements of the results of tapping, which he caused to be made and could verify in part. The figures reported by Picht are given in the following table:

No. Year.	Age of Trees.	Total Number of Tappings.	Total Yield of Dry Rubber, Kilos.	Rubber Yield Per Tree and Tapping, Grams.	Rubber Yield Per Tree and Tapping, Grams.	Per Cent of Latex
1 1911	5-7	214,298 (about half of the trees 2 x tapped)	16,929	7.9	11.7	30.0
2 1912	6-8	353,350 (part of trees 3 x tapped)	2,837	8.0		8.9
3 1913	6-10	194,755 (part of trees 3 x tapped)	1,316	6.7	21.1	22.6

Picht unfortunately can not give a reliable scale of crops; yet tree production increasing from the sixth to the tenth year from 10 to 50 grams seems to him attainable. When Preuss puts the yearly yield of a six-year *Kickxia* at 50 to 60 grams, that of a 15-year tree at 500 grams of rubber, his statements find as little support in the results reported in the article before us, as do the assumption of Schulte im Hofe that a tree with a trunk circumference of 50 to 55 centimeters will yield about 100 grams, or the crop estimates of the English investigator Christy, who assumes that the yield of five to ten-year trees increases from 85 to 426 grams.

At all events Picht believes, on the basis of his experiences

before the war, that it is useless to speak of profitable results from *Kickxia* in a tropical agricultural sense, but that at best we can consider only the value of the individual trees, which can be realized only on their being tapped to death, but which in comparison with the clearing necessary to open up a new form of cultivation amounts practically to nothing. This led one Kamerun planter in an excess of rage to set fire to his whole *Kickxia* possessions.

Thus, to use Picht's words, *Kickxia* was the most unpleasant chapter in the history of Kamerun plantation, and it must be looked upon as a great piece of good fortune that the amount of capital invested in this cultivation is comparatively small and that the estates, which at first turned extensively to *Kickxia*, for the most part were diverted at the right time to other cultures, so that the *Kickxia* portion in them sank to the rank of an unimportant side culture. Moreover, we should mention here what Picht does not state, that at the beginning great plots of *Kickxia* were planted which did not belong to the species *K. elastica*, but were obtained from specimens of the wholly valueless species *K. africana*, as was only discovered later.

In another article ("Tropenpflanzer," January, 1920), Picht treats of the prospects of profits from the *Hevea brasiliensis* in Kamerun and forms a wholly different judgment. In view of the amazing profits obtained from the rubber plantations of Eastern Asia and of the increasing lack of confidence in the results of the *Kickxia*, the Kamerun planters turned to the cultivation of *Hevea*. After they had succeeded in obtaining *Hevea* stumps in large quantities from Eastern Asia and transporting them to West Africa, there was no difficulty in raising this tree, especially as the ground and the rainfall conditions in Kamerun were in every way favorable.

At the outbreak of the war large *Hevea* plots in Kamerun had reached an age that permitted tapping. Picht, who made a journey to Ceylon and the Straits Settlements in 1910-1911, was in a position to make comparisons between the growth of the *Hevea* there and in Kamerun. He was unable to see any difference. Later he was able, on the basis of experiments which were made on the plantations under his care, to give figures which allow safe inferences to be drawn on the profitable character of *Hevea* cultivation in Kamerun. He prints a table taken from the "Straits Times" on the average yield of *Hevea* of various ages, and then gives more detailed accounts of what the Kamerun *Hevea* yielded in comparison. The results of the figures follow:

No.	Age of Heveas. Years.	Number of Tappings (Renewed Cuts) Per Tree.		Rubber Yield Per Tree. Kilos.		Straits Figures for Comparison. Kilos.	
		1	2	1	2	1	2
1	6	3	5	1.16	0.75	0.75	0.35
2	5	3	5	1.16	0.75	0.75	0.35

The yields in Kamerun are, therefore, substantially greater than in the Straits, which is the consequence probably of the richer soil in Kamerun and the better rainfall condition there. It should be mentioned also that the above tapplings were made with an extremely careful regard for the bark, such as has gradually been shown to be the best thing in Asia. *Hevea* in Kamerun is generally planted mixed with cacao—about 180 *Hevea* and 542 cacao trees to a hectare.

Picht presents more detailed estimates of profits and comes to the conclusion that in Kamerun, whose negroes have shown themselves to be an industrious and relatively cheap form of labor, *Hevea* cultivation should profit by the expensive experience gained in other countries, with results no less successful than in East Asia.

AFRICAN NOTES.

From the Gold Coast of Africa comes an interesting report of the Agricultural Department for 1918, which shows a steady purpose of building up again the rubber trade under discouraging circumstances. Less than ten years ago West Africa was exporting over 14,000 tons of rubber and seemed to have an even chance with the plantations of the Far East. The govern-

ment keeps up nine agricultural stations which report on rubber cultivation. Those at Targuah and Cormassie have 78 and 60 acres, respectively, devoted to rubber; the others are much smaller. On all, elaborate experiments are being made in tapping, in planting, in the distance from each other of the trees, and the diseases which seem to be unduly prevalent, are studied. Small farms, planted with rubber, are prepared for the natives, who cannot be made to take an interest in them; the white planters, too, care little for rubber.

The cause of the depression is ascribed to the war, but it is more likely due to the hopelessness of contending with the triumphant Asiatic plantation rubber. Still the statistics demonstrate that on the Gold Coast and in the surrounding territory the physical conditions for growing *Hevea* rubber, as well as that of the indigenous *Funtumia elastica* are very favorable, if the proper supply of labor can be obtained, and that England can fall back on these possessions for her rubber supply in case any political or other disaster were to deprive her of her East Indian and Malayan territories.

Exports from French West Africa, of which rubber forms an important part, were interfered with on account of the deficiency of vessels in the period following the armistice. The figures were:

	Pounds.	Value.
French Guinea	1,559,800	\$683,730
Ivory Coast	547,800	240,406
Senegal	719,400	315,994
Totals	2,827,000	\$1,240,126

In 1917, French West Africa exported 2,873,200 pounds of rubber, valued at \$1,260,396. Only \$5,734 worth of rubber from the Ivory Coast went directly to the United States.

SINGAPORE GUTTA PERCHA EXPORTS.

As an example of the upward tendency in the prices asked for gutta percha, it may be stated that "Pahang red," which five years ago cost approximately \$158 per picul (133 1-3 pounds), rose to \$312 at the close of 1919, with supplies even at this price practically unobtainable. Similarly, "Banjirmassin" increased from \$85 to \$142 during the same period, and this may be taken as a fair average of the advances made on all grades of gutta percha during the past five years. It will thus be seen that increases of 80 to 100 per cent have taken place.

Gutta percha to the amount of 1,469 long tons, valued at \$1,468,792, was imported into Singapore during the year 1918. Of this amount 1,372 tons, at a value of \$1,358,764, were imported from the Dutch East Indies, while only 91 tons, valued at \$107,431, were imported from British North Borneo, Sarawak, and the Federated Malay States.

Of gutta inferior, 5,243 tons, valued at \$518,975, were imported into Singapore during the year 1918, most of which came from Dutch Borneo and Sarawak, Sumatra furnishing only 300 tons.

The following table shows the quantities, values, and countries of destination of gutta percha and gutta inferior exported from Singapore during 1918:

Countries of destination	Quantity	Value
United Kingdom	1,856	\$1,556,357
Canada	138	44,891
France	113	43,909
Italy	30	11,447
Japan	31	22,755
United States	1,281	362,736
Totals	3,149	\$2,042,099
GUTTA INFERIOR.		
United Kingdom	99	9,539
Canada	17	6,365
Australia	17	1,797
Other British possessions	1	42
France	1	1,022
Japan	144	16,009
United States	834	89,959
Other foreign countries	2	227
Totals	1,178	\$124,960

Pneumatic Tire Tread Designs.

DECEMBER, 1916, TO SEPTEMBER, 1917.

Patent No.	Patentee's Name and Address
(1.) 49,754	E. P. Altenberg, East Palestine, Ohio.
(2.) 49,786	The B. F. Goodrich Co., New York City.
(3.) 49,792	G. W. Beldam, Ealing, England.
(4.) 49,811	C. A. Westover, Youngstown, Ohio.
(5.) 49,836	The Sebring Tire & Rubber Co., Sebring, Ohio.
(6.) 49,877	The Victor Rubber Co., Springfield, Ohio.
(7.) 49,901	The Amazon Tire & Rubber Co., Akron, Ohio.
(8.) 49,947	S. J. Bogan, Torrance, California.
(9.) 49,969	The B. F. Goodrich Co., New York City.
(10.) 50,567	J. D. Kline and C. A. Barnholtz, Akron, Ohio.
(11.) 50,644	H. S. Blynt, Birmingham, New York.
(12.) 50,655	G. P. Herrick, New York City.
(13.) 50,673	S. S. Adams, Lafayette, Tennessee.
(14.) 50,681	United & Globe Rubber Mfg. Cos., Trenton, New Jersey.
(15.) 50,769	E. Von Varvas, and J. I. Tavora, Birmingham, New York.
(16.) 50,931	J. M. Gilbert, New York City.
(17.) 49,956	The B. F. Goodrich Co., New York City.
(18.) 50,961	Racine Rubber Co., Racine, Wisconsin.
(19.) 50,976	The B. F. Goodrich Co., New York City.
(20.) 50,977	The B. F. Goodrich Co., New York City.
(21.) 51,013	F. T. Faircloth, San Francisco, California.
(22.) 50,352	R. H. Keaton, San Francisco, California.

Patent No.	Patentee's Name and Address
(23.) 50,769	C. B. Reynolds, Savette, California.
(24.) 50,361	W. A. Robbins, Glen Ridge, New Jersey.
(25.) 50,540	W. D. Freese, Akron, Ohio.
(26.) 50,431	The Norwalk Tire & Rubber Co., Norwalk, Connecticut.
(27.) 50,130	W. R. Buckley, New York City.
(28.) 50,121	W. R. Buckley, New York City.
(29.) 50,134	R. H. Keaton, San Francisco, California.
(30.) 50,190	Hood Rubber Co., Watertown, Massachusetts.
(31.) 50,202	F. Hopkinson, New York City.
(32.) 50,793	M. P. Oliver, Berkeley, California.
(33.) 50,840	J. C. Koonces, River Forest, Illinois.
(34.) 50,915	The B. F. Goodrich Co., New York City.
(35.) 50,873	J. A. Lutz, Los Angeles, California.
(36.) 50,828	W. R. Buckley, New York City.
(37.) 50,871	F. T. Faircloth, San Francisco, California.
(38.) 50,881	F. Von Varvas, Washington, D. C.
(39.) 50,265	The Lancaster Tire & Rubber Co., Lancaster, Ohio.
(40.) 50,269	P. De Mattia and R. De Mattia, Clifton, New Jersey.
(41.) 50,282	G. W. Odell, South Bend, Indiana.

(43.) 49,958	W. Dunham and F. W. Willis, Toronto, Ontario, Canada.
(44.) 49,953	W. R. Denham, Akron, Ohio.
(45.) 49,952	G. Crowley, Hartford, Connecticut.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED MARCH 16, 1920.

- N**O. 1,333,630. Demountable rim for tires. J. E. Rhodes, Dallas, Texas.
 1,333,673. Crate for automobile wheels or rims. O. A. Parker, Cleveland, Ohio.
 1,333,674. Automobile wheel with pneumatic tires. O. A. Parker, Cleveland, Ohio.
 1,333,679. Demountable rim for tires. H. D. Rey, Avarua, Raratonga Island, Cook Islands, New Zealand.
 1,333,680. Demountable rim for tires. H. D. Rey, Avarua, Raratonga Island, Cook Islands, New Zealand.
 1,333,748. Demountable rim for tires. J. M. Berry, Detroit, Mich.
 1,333,779. Automobile tire. W. W. Robinson, East Liverpool, Ohio.
 1,333,791. Hose coupling. C. O. Brandt, St. Paul, Minn.
 1,333,915. Tire shoe and rim. S. E. Hall, assignor of one-half to W. G. Moser—both of Akron, Ohio.
 1,333,928. Cushion wheel construction with dual solid tires. W. C. Martin, assignor to Morand Bros.-Martin Cushion Wheel Co.—both of Chicago, Ill.
 1,333,929. Cushion wheel construction with single solid tire. W. C. Martin, assignor to Morand Bros.-Martin Cushion Wheel Co.—both of Chicago, Ill. (See THE INDIA RUBBER WORLD, November 1, 1919, page 88).
 1,333,961. Dilator. C. O. Burgoon, Monmouth, Ill.
 1,333,983. Resilient heel lift. F. Kish, Elyria, Ohio.
 1,334,011. Automobile wheel with pneumatic tires. E. K. Baker, assignor to Black Wheel & Rim Co.—both of Chicago, Ill.
 1,334,067. Cushion tire. W. A. Angleyer, Indianapolis, Ind.
 1,334,110. Reinforced pneumatic tire. D. Morarty, Oakland, Calif.
 1,334,171. Blow-out patch. C. K. Russell, Jr., Orange, Texas.
 1,334,176. Indoor golf game. W. H. Seagrave, Cleveland, Ohio.
 1,334,204. Air cushion tire. H. S. Williams, assignor of one-half to O. Keller—both of San Antonio, Texas.
 1,334,205. Cushion tire. H. S. Williams, assignor of one-half to O. Keller—both of San Antonio, Texas.
 1,334,210. Rubber heel or lift. T. F. Ashton, assignor of one-half to E. C. Heilhecker—both of Bristol, R. I.
 1,334,237. C. Surgical heel with pneumatic cushion. H. Fleck, Oklahoma, Okla.
 1,334,378. Hot-water bottle. H. E. Kaufman, Westport, N. Y.
 1,334,438. Rubber horseshoe reinforced by metal insert. G. E. Crump, assignor to Perfection Rubber-Metal Horseshoe Co.—both of Akron, Ohio.
 1,334,448. Inflatable tire. W. P. Gordon, assignor of one-half to T. B. Jacobs—both of Tarboro, N. C.
 1,334,493. Demountable wheel tire. J. C. Holahan, assignor to Hol-Mor Wheel Co.—both of San Francisco, Calif.
 1,334,514. Diaper supporter. M. J. Beitter, Nogal, N. M.
 1,334,635. Grommet or tire pad and method of making them. A. C. Pratt, Deer River, Conn.
 1,334,793. Tank ball of rubber and rubber composition. C. Riegger, New York City.

ISSUED MARCH 30, 1920.

- Tire filler. O. L. Huffman, Weatherford, Texas.
 1,335,115. Cushion spring wheel. W. W. Kruttsch, Coffeyville, Kans., assignor of one-half to W. M. Harrison, Muskogee, Okla.
 1,335,268. Pneumatic tire. R. E. Baker, Jerome, Mich.
 1,335,273. Rubber shoe. A. M. Bruce, Ira, Mo.
 1,335,341. Fountain pen. H. J. Jorgensen, Jersey City, N. J.
 1,335,411. Tire-shoe and rim. J. H. Wagonbush, Akron, Ohio.
 1,335,442. Pneumatic tire. W. Kline, Mogadore, assignor to The Interlocking Cord Tire & Belt Co., Akron—both in Ohio.
 1,335,467. Closure for water bottles, etc. J. C. Traynor, Buffalo, N. Y.
 1,335,469. Pneumatic tire. R. R. Yale, Milford, Del.
 1,335,496. Link cushion tire. M. Hamburger, Baltimore, Md.
 1,335,505. Raincoat. P. O. Huntington, Brighton, assignor to H. M. Sawyer & Sons, Cambridge—both in Massachusetts.
 1,335,710. Multiple-tread pneumatic tire. A. Jakovlev, assignor to Jak Tire Corp.—both of San Francisco, California.
 1,335,711. Dual section pneumatic tire. A. Jakovlev, assignor to Jak Tire Corp.—both of San Francisco, Cal.
 1,335,712. Sectional pneumatic tire. A. Jakovlev, assignor to Jak Tire Corp.—both of San Francisco, Cal.
 1,335,713. Vehicle tire. A. Jakovlev, assignor to Jak Tire Corp.—both of San Francisco, Cal.

REISSUES.

- 14,832. Tennis ball. A. T. Saunders, Chicopee, Mass., assignor to A. G. Spaulding & Bros., Jersey City, N. J. (Original No. 1,287,766, dated December 17, 1918).

ISSUED APRIL 6, 1920.

- Demountable rim for tires. O. Abadi, Fairbanks, Pa.
 1,335,820. Resilient tire. F. C. Jones, Des Moines, Iowa.
 1,335,840. Water-carrying attachment for safety razors, similar to ink sack in fountain pens. J. F. Kaylor, Pekin, Ill.
 1,335,861. Dust cap for protecting automobile tire valves. J. Shaw, St. Louis, Mo.
 1,335,916. Pneumatic tire. A. M. Povrte, London, England.
 1,335,929. Dust proof and mud proof tire with elastic tube in molding around center tread. J. Robett, Cleveland, Ohio.
 1,335,976. Valve for inner tube valve stems. V. A. Leach, San Francisco, Calif.
 1,336,023. Combined valve cap and dust cap. A. B. Cuttall, Ottumwa, Iowa.
 1,336,126. Automobile tire. L. Hoffmeister, Milwaukee, Wis.
 1,336,127. Inner tube for pneumatic tire. J. J. Leach, Jr., Jersey City, N. J., assignor by mesne assignments to United States Compression Inner Tube Co., Tulsa, Okla.
 1,336,419. Syphon starter. J. S. Harbick, New York, N. Y.
 1,336,418. Pneumatic tire with separate air chambers. E. G. Fido, Bombay, India.

THE DOMINION OF CANADA.

ISSUED MARCH 2, 1920.

- Sole and heel of boots and shoes. G. W. Beldam, Faling, and U. S. Benjamin, Brentford, inventors—both in Middlesex, England.
 197,609. Shoe for pneumatic tires. L. F. Bacon, Estelene, Colorado, U. S. A.
 197,632. Sponge rubber cushion tire. T. W. Costello, San Francisco, California, U. S. A.
 197,647. Sectional tire. E. W. Edwards, Akron, Ohio, U. S. A.
 197,666. Stamp and envelope moistener. W. Hegland, Plentywood, Montana, U. S. A.
 197,667. Inner tire. H. M. Henning, Hinkley, California, U. S. A.
 197,674. Pneumatic tire with tread of metal sheathing. C. R. Irvine, Sarnia, Ontario, Canada.
 197,685. Tire tread. I. Laube, Deer Island, Oregon, U. S. A.
 197,687. Reinforced tire. H. J. Lomer, Detroit, Michigan, U. S. A.
 197,720. Pneumatic tire filled with small cells self-inflated when air is admitted to tube containing them. W. H. Richards, Knoxville, Tennessee, U. S. A.
 197,733. Reinforced rubber and spring tire. A. F. Stockwell, Los Angeles, California, U. S. A.
 197,742. Pneumatic tire. P. E. van Berendson, Amsterdam, The Netherlands, U. S. A.
 197,755. Rubber retainer. P. J. Young, Santa Susana, California, U. S. A.
 197,801. Sanitary baby pants. The J. B. Kleintert Rubber Co., assignee of G. K. Guinzburg—both of New York City, U. S. A. (See THE INDIA RUBBER WORLD, December 1, 1919, page 137).
 197,832. Pneumatic tire. P. F. White, assignor of a half interest to A. Brooks—both of Wellington, New Zealand.

ISSUED MARCH 9, 1920.

- Hose supporter. S. A. Glynn, W. H. Wolpert and Chas. J. Hagan, inventors—all of Antigo, Wisconsin, U. S. A.
 197,871. Transversely split demountable rim for tires. W. N. Booth, Detroit, Mich., U. S. A.
 197,916. Demountable rim for tires. R. R. Craft, Norfolk, Nebraska, U. S. A.
 197,952. Two-part rim for tires. B. F. C. Haanel, Ottawa, Ontario, Canada.
 198,036. Rubber sole. A. Santacrose, Elyria, Ohio, U. S. A.
 198,036. Demountable rim for tires. J. Walker, Canonsburg, Pa., U. S. A.
 198,075. Hose coupling. The Canadian Consolidated Rubber Co., Limited, Montreal, Canada, assignor of J. Brown, Union Hill, New Jersey, and A. A. Somerville, New York City, New York—both in U. S. A.
 198,088. Demountable rim for tires. The Hayden Manufacturing Co., assignee of W. A. Hayden—both of Minneapolis, Minn., U. S. A.
 198,091. Cushion tire. The K. F. & C. Tire & Rubber Corp., assignee of F. A. Krusemark, L. G. Funkhouser and H. G. Carpenter, all of Roanoke, Virginia, U. S. A. (See THE INDIA RUBBER WORLD, August 1, 1919, page 666).
 198,112. Demountable rim for tires. The Two-Part Rim Co., assignee of C. L. Peters and A. L. Johnson—all of Worcester, Massachusetts, U. S. A.

ISSUED MARCH 16, 1920.

- Inner tire protector. C. A. Stuart and G. E. Stuart, inventors—both of Oregon City, Oregon, U. S. A.
 198,165. Inner tube for automobile tires. G. C. Berryman, Los Angeles, California, U. S. A.
 198,257. Inner tube for tires. T. L. Morton, New Orleans, Louisiana, U. S. A.
 198,266. Spring tire. J. L. Ogden, Chicago, Ill., U. S. A.
 198,312. Hose coupling. W. L. Walker, New York City, U. S. A.
 198,365. Tire. D. S. Myers, St. Louis, Missouri, and S. Johnstone, Buffalo, New York, assignee of a half interest—both in U. S. A.

ISSUED MARCH 23, 1920.

- Cushioned wheel hub. J. Bosdon and J. Mitrosky, inventors—both of Perth Amboy, New Jersey, U. S. A.
 198,396. Pneumatic support for motorcycles. H. Seibel, San Francisco, California, U. S. A.
 198,511. Pneumatic seat support for motorcycles. H. Seibel, San Francisco, California, U. S. A.
 198,512. Pneumatic seat support for motorcycles. H. Seibel, San Francisco, California, U. S. A.
 198,557. Footwear of rubber, rubber compound and fiber. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of C. J. Randall, Nauauguck, Connecticut, U. S. A.
 198,588. Brassiere with elastic waist section. The Treo Co., Inc., assignee of M. W. Schloss—both of New York City, U. S. A.
 198,597. Friction shoe. E. A. Nafield, New Haven, Connecticut, and E. O. Christiansen, assignee of a fourth interest, Walpole, Massachusetts—both in U. S. A.

ISSUED MARCH 30, 1920.

- Rubber heel. A. Santacrose, Elyria, Ohio, U. S. A.

THE UNITED KINGDOM.

ISSUED MARCH 10, 1920.

- Modified scarf as head covering, of rubberized or other material. S. E. Smith, Durskirk Crescent, Halifax, and A. Pearson, Cross Exchange, Bournemouth, Manchester.
 137,469. Device for attaching revolvable rubber heels. W. Plowright, 18, Palmerston avenue, Whitley Range, Manchester.
 137,700. Studs or bars for foot-ball and like boots, composed of layers of leather and rubber. R. T. Richardson, Victoria Road, Northampton.

ISSUED MARCH 17, 1920.

- Studs or bars for foot-ball and like boots, composed of layers of leather and rubber. R. T. Richardson, Victoria Road, Northampton.

- 137,729. Detachable rubber pad for heels. A. J. Mallow, 11 Lakefield Road, Westbury avenue, Wood Green, London.
- 137,766. Tire reinforcing shoe of rubber vulcanized to steel band, secured to pneumatic tires by inflation. F. Lee-Decks, 6 Bromfield Road, Chislehurst, Essex.
- 137,812. Aluminum shell heel for ladies' boots, recessed to receive conical plug of leather, rubber, etc. D. H. Finberg, 210 Washington avenue, St. Louis, Missouri, U. S. A.

ISSUED MARCH 24, 1920.

- 137,886. Weighing device for cyclists' skirts, padded with rubber. F. D. Henman, 25 Kentish Road, Rotorue.
- 137,902. Respirator for aviators, etc. F. Martin, 30 Oxford Road, Finsbury, and W. Neus, 3 London Wall Buildings—both in London.
- 137,921. Neckties with lining covered with gutta percha. F. W. Clarke, 31 Gower Road, Forest Gate, London.
- 137,931. Elastic band with fastener, for retaining umbrella ribs. H. F. McShane, 16 Fairland Mansions, Bedford Park, London.
- 137,942. Cushion wheel. E. B. Killen, 27 Queen Victoria street, London.
- 137,998. Reinforced pneumatic tire. W. L. Colmer, 16 The Crescent, Combs, Stowmarket, Suffolk.
- 138,010. Rubber pads for boot and shoe soles. Refers to specification No. 132,750 listed in *The India Rubber World*, January 1, 1920. H. J. Fussell, 3 St. George's Building, Upper Bristol Road, Bath, and E. G. Fussell, 167 Colindale Road, Clifton, Bristol.
- 138,029. Water-bottle and like stoppers. M. C. Schweinert, 226 Palisade avenue, West Hoboken, New Jersey, U. S. A.
- 138,069. Blow connections for inflating Automobile Safety Tire Valve Core, assignee of S. Kahn—both of 1765 Broadway, New York City, U. S. A. (Not yet accepted.)

ISSUED MARCH 31, 1920.

- 138,169. Coupling for mine ventilating hose. Refers to specification No. 106,219. N. B. Braly, 14 West Granite street, Butte, Montana, U. S. A.
- 138,195. Rubber pad for soles and heels. B. Etkind, 32 Houndsditch, London.
- 138,229. Rubber sole. J. Brandwood, Brandleholme, Bury, Lancashire, and The 53 Upper Bedford Place, London.
- 138,278. Artificial feet with rubber cushioned joints. C. Desoutter, 51 Baker street, London.
- 138,294. Corker with elastic inserts. D. Kops, 525 West End avenue, Manhattan, New York City, U. S. A.
- 138,296. Shoe for retreading tires. C. C. Gates, 999 South Broadway, Denver, Colorado, U. S. A.
- 138,306. Valve for inflated balls and balloons. Société Etablissements Bogner et Burnet, 21 rue des Filles du Calvaire, Paris. (Not yet accepted.)
- 138,358. Reinforced pneumatic tire provided with openings for cooling. T. C. McEwen, 20 Beach street, Belleville, New Jersey, U. S. A. (Not yet accepted.)

NEW ZEALAND.

ISSUED MARCH 11, 1920.

- 41,256. Rubber heel. C. J. Watton, 8 Cliff Road, St. Clair, Dunedin, New Zealand.

AUSTRALIA.
TO AMERICANS.

- 11,192. Device for detaching pneumatic tires. H. P. Kraft, Ridgewood, N. J., U. S. A.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 499,528. (December 18, 1918.) Improvements in vehicle wheels. The Dunlop Rubber Co., Limited.
- 499,807. (May 19, 1919.) Pneumatic tire. L. Martenet.
- 499,965. (May 23, 1919.) Elastic dumbbells. G. Schurr.
- 500,066. (May 27, 1919.) Life saving device.
- 500,094. (May 27, 1919.) Improvements in wheels, particularly those of airplanes. The Dunlop Rubber Co., Limited.
- 500,081. (May 27, 1919.) Improvements in electric insulation. P. Venturini.

GERMANY.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 320,335. (January 4, 1914.) Casing for wheel tires. The Dunlop Rubber Co., Limited, and Collin Macbeth, Birmingham, England.
- 321,105. (May 6, 1914.) Casing for resilient tire. R. Strong, Farnborough, England.
- 321,139. (June 13, 1919.) Packing and insulating material. G. Ruth and Dr. E. Aaser, Wandsbek.
- 321,186. (February 11, 1919.) Tire in which a soft rubber layer is interposed between an elastic ring and the hard rubber outer casing. St. Helens Cable & Rubber Co., Limited, Arple, near Warrington, England.

TRADE MARKS.

THE UNITED STATES.

- No. 100,457. Representation of a shoe behind the letter T—boots and shoes made of leather, rubber, and canvas. Thomson Shoe Co., St. Paul, Minn.
- 109,995. The words LIFER KAIN within a circle behind a cross-bar—waterproof clothing. Union City Manufacturing Co., Union City, Tenn.
- 111,596. Representation of a seal bearing the word NUSAT—tire-lining compound. The Middletown Accessory-Laboratories Co., Middletown, O.

- 115,191. Representation of a tag bearing the word Tao having the cross-piece of the U extended to form a seal—air stoppers and sphygmomanometers, syringes, etc. Charles J. Taishabie Manufacturing Co., Brooklyn, N. Y.
- 115,192. The word Tao, having the letters A and G joined by a short connecting line from the foot of the right leg of the A—sphygmomanometers, syringes, etc. Charles J. Taishabie Manufacturing Co., Brooklyn, N. Y.
- 116,241. The word "Zip" quoted—self-vulcanizing tire patches. J. M. Stucker, Rosedale, Kans.
- 117,246. Representing a round seal label having the figure of an athlete balancing a ball between the words Mr. Dan—sports goods including cage balls, rubber bladders, striking bags, etc. Fred M. Hart Manufacturing Co., St. Louis, Mo.
- 120,393. The word UNO—running-board mats, heel rests, etc., for automobiles. The C. Spiro Manufacturing Co., New York City.
- 121,385. The word DUREX—waterproof textile fabrics. The Duretex Co., Newark, N. J.
- 122,024. The word RUBEN—waterproof coats. W. O. Peake, Limited, London, Eng.
- 122,907. The words D-PEE-CHIE—chewing gum. O-Pee-Chie Gum Co., Limited, London, Ont., Can.
- 123,501. The representation of a lion above the word LOOS—waterproof fabrics. James Scarlett, Seattle, Wash.
- 123,570. The word ARCO—canvas outing shoes. Arley Rubber Co., Hudson, Mass.
- 123,988. Representation of a label bearing the letters and words L. P. L. CHIC-MINT JR. Co. on a combined circle and diagonal cross-bar—chewing gum. L. P. Larson, Jr., Co., Chicago, Ill.
- 124,117. The word WILSON—raincoats. Franklin Simon & Co., Inc., New York City.
- 124,238. The word HESKIE—tires, tire casings, and inner tubes. The Portage Rubber Co., Warburton, Ont.
- 124,391. The word BLACKSTONE—tires, tire casings, and inner tubes. The Canton-Blackstone Co., Canton, O.
- 124,962. The word WESTERN STATES, having the letters W and N larger than the others with the word STATES between them—tires, inner tubes, tire boots, and tire patches. Washington Tire & Rubber Co., Spokane, Wash.
- 124,963. The letters W and S superimposed on the upper and lower parts of the circumference of a heavy black circle—tires, inner tubes, tire boots, and tire patches. Washington Tire & Rubber Co., Spokane, Wash.
- 125,003. The word FLEXIDE—composition rubber material in sheet form. The Marathon Tire & Rubber Co., Cuyahoga Falls, O.
- 125,143. Representation of a double outlined geometrical figure—chewing gum. Wm. Wrigley, Jr., Co., Chicago, Ill.
- 125,302. The words "GEM-DANDY" quoted garters. Penn Bros. Susquehanna Co., Madison, N. C.
- 125,576. The words "KLEAR-SKIN" quoted, above the head of a girl holding a sponge against her face—rubber sponges. The Miller Rubber Co., Akron, O.
- 126,254. Outline of a rubber heel bearing the word Scoor, and the representation of a scoop—rubber and rubber composition heels. Panther Rubber Manufacturing Co., Stroughton and Chelsea, Mass.
- 126,558. Representation of a conventionalized double-headed animal beneath the name J. & T. Cousins Co. and above the words NEW YORK, U. S. A.—rubber and fabric boots and shoes. J. & T. Cousins Co., Brooklyn, N. Y.
- 126,905. The figure and letters BROOK with the letters in lower case type—garters. Penn River Corp., Philadelphia, Pa.
- 127,254. The word RELIM—water bottles, syringes, and rubber tubes. The Miller Rubber Co., Akron, O.

THE DOMINION OF CANADA.

- 25,590. The word FLENG—garters, hose supporters, and arm bands. A. Stein & Co., Chicago, Ill., U. S. A.
- 26,059. Representation of the head of a bull moose, with the name "THE MERCHANTS RUBBER CO., LIMITED" in different sizes of block type, arranged so as to form a base—rubber foot-ware. Canadian Consolidated Rubber Co., Limited, Montreal, Que.
- 26,062. The word OUTLOOK in fancy letters—windshield cleaners. The Outlook Co., Cleveland, O., U. S. A.
- 26,068. The number and word 4810 AIRTITE—rubber hose. Canadian Consolidated Rubber Co., Limited, Montreal, Que.
- 26,071. The word ADMIRALTY—rubber goods and packing of all kinds. Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ont.
- 26,101. The letters K. & S. arranged within a circular band—tires, tubes, and accessories—rubber goods molded, blown, dipped, hand made; mechanical rubber goods, and footwear. K. & S. Canadian Tire & Rubber Co., Limited, Toronto, Ont.
- 26,108. The word CROCOMAX—rubber and rubber composition and fiber taps for boots and shoes. Emery Heel Sales Co., Boston, Mass., U. S. A.

THE UNITED KINGDOM.

- 384,720. The word HERMETIC tire valves, etc. The Self-Sealing Rubber Co., Limited, Hermetic Works, Ryland street, Birmingham, Warwickshire.
- 384,721. The word HERMETIC—linen or hemp canvas prepared for tire manufacture, rubber-proofed canvas, etc. The Self-Sealing Rubber Co., Limited, Hermetic Works, Ryland street, Birmingham, Warwickshire.
- 384,722. The word HERMETIC—tires, inner tubes, repair patches, rubber bulbs, heel pads, etc. The Self-Sealing Rubber Co., Limited, Hermetic Works, Ryland street, Birmingham, Warwickshire.
- 384,723. The word HERMETIC—repair outfits for tires, vulcanized fiber, electrical insulating—rubber goods molded, blown, dipped. The Self-Sealing Rubber Co., Limited, Hermetic Works, Ryland street, Birmingham, Warwickshire.
- 388,638. The word ARIEL—all rubber goods in Class No. 40 except elastic webs and cords used in manufacturing clothing. Ariel Works, Limited, Ariel Works, Dumbourk, Birmingham.
- 399,633. The words ASACAS—races. A. St. J. Cooke, 40A Hyde Park gate, London, S.W.7.
- 399,668. The words in script, EL CONDE DE RAMIREZ DE ABRIL—gas masks and respirators. F. H. Ramirez de Arrellano, el Conde de Ramirez de Arrellano, Hacheiro de Arrellano, Barrio Green, near Horsham, Sussex.

- 389,905 Representation of an electrical insulator bearing the word **WALGER**, within a diamond insulators and insulating preparations included in Class No. 40. E. A. Valslaw, Glasgow Road, Bolton, County of Peel, Ontario, Canada.
- 391,055 The word **ROSCO** within a conventional figure inside of a diamond made up of black and white oblong checks artificial leather. The Roscoble Rubber Co., Limited, Shaw, enough Rubber Works, Shawcough Road, Watford, near Manchester.
- 391,099 Representation of an airplane with a woman aviator, bearing the words **ANTI-FET INSULER**, the whole above the words (**ACETYLENE-FLEX**) in parentheses, non-medicated inhalers included in Class No. 11. C. J. Clapp, 8 Botolph Lane, Eastcheap, London, E. C. 3.
- 392,726 The word **STOCO**—rubber-rimmed safety goggles, etc. The Standard Optical Co., 160 Leycester street, Geneva, Switzerland. U. S. A. (Care of C. W. Dummett & Son, 46 Gresham street, London, E. C. 2.)
- 393,149 The word **USCO**—tires and parts of tires. United States Rubber Co., 1799 Broadway, New York City, U. S. A. (Care of Halsey, Lake & Co., 28 Southampton Buildings, London, W. C. 2.)
- 393,451 The word "**USCO**" quoted rubber heels. United States Rubber Co., 1799 Broadway, New York City, U. S. A. (Care of Halsey, Lake & Co., 28 Southampton Buildings, London, W. C. 2.)
- 395,985 The word **RAYNO**—rubber erasers. E. Chambers & Co., Limited, The Garden Pencil Works, Derby Road, Stapleford, Nottinghamshire.
- 396,183 The word **REBROX**—all goods included in Class No. 40. Herbert J. Russell & Co., Locksbrook Rubber Mills, Locksbrook Road, Lower Weymouth, Bath.
- 396,215 Representation of head of Minerva above the word **MINERVA**—goods manufactured from rubber and gutta percha except heel pads, etc. Copeslate, Crampton & Co., 5 Bow Church Yard, London, E. C. 4.
- 396,240 The words **EL PELOATO** above representation of a juggler of ball and swords, all above a scroll—rubber and gutta percha goods not included in classes other than Class No. 40. Koly Coleman & Co., 5 Hall street, Manchester.
- 396,307 The word **PAVILIN**—all rubber goods included in Class No. 11. The Leyland & Birmingham Rubber Co., Limited, Golden Hill Works, Leyland, Lancashire.
- 396,308 The word **PAVILIN**—all rubber goods included in Class No. 11. The Leyland & Birmingham Rubber Co., Limited, Golden Hill Works, Leyland, Lancashire.
- 396,309 The word **PAVILIN**—all rubber goods included in Class No. 11. The Leyland & Birmingham Rubber Co., Limited, Golden Hill Works, Leyland, Lancashire.
- 396,418 The word **VULKANE**—brushes included in Class No. 50. C. H. Leas & Sons, Leasdales Works, Shefford Heath, Birmingham.
- 396,480 The word **FOUNTA**—foot balls. Jackson & Blackburn, 51 Park Square, Ossett, Yorkshire.
- 396,578 Representation of a lizard above the word **LIZARD**—fountain pens. A. W. Brooke, "Mera Ghar," Woodhey, Rock Ferry, Cheshire.
- 396,595 The word **BIBACOS**—goods manufactured from rubber and gutta percha, not included in classes other than No. 40. Brother-ton, Ratcliffe & Co., Limited, Winchester House, Old Broad street, London, E. C. 2.
- 396,776 The word "**SOQUETTE**" within quotation marks—a game called table football. George A. Thompson, 405 Rotherhithe New Road, North Woolwich, London, S. E. 16.
- 396,849 The word **ALADIN**—goods manufactured from rubber and gutta percha. Industrial Rubber Products, Limited, Brook House, 191-192 Tottenham Court Road, London, W. 1.
- 396,855 The word **SACATIS**—sanitary appliances. A. de St. Dalmas & Co., 40 Belgrave Gate, Leicester.
- 396,936 The word **INDUPRO**—goods manufactured from rubber and gutta percha. Industrial Rubber Products, Limited, Brook House, 191-192 Tottenham Court Road, London, W. 1.
- 397,007 Representation of a label bearing the bust of a girl and the word "ELAC"—artificial rubber goods and druggists' sundries. I. A. Jackson, trading as London Rubber Co., 183 Aldersgate street, London, E. C. 1.
- 397,113 The word **TRAYX**—electrical insulators, etc. of ebouite or like substances manufactured from rubber or gutta percha. Trevelyan & Co., 155 Bisculden street, Birmingham.
- 397,155 The word **LASTRAC**—corsets. Drew, Son & Butcher, Limited, Gascoyne Factory, Elm street, Bath.
- 397,301 The words **BLACK ADDER**—garden hose. Reliance Rubber Co., Limited, 12-213 Upper Thames street, London, E. C. 4.
- 397,314 The word **FOUR**—pneumatic tires. S. A. Andrews, 4 Marlton avenue, Great Crosby, Liverpool.
- 397,445 The word **TYRIAN** above a tire inclosing the monogram T. R. Co. all above the words "TRADE MARK"—tires. Tyer Rubber Co., Andover, Mass., U. S. A. (Care of B. J. Wildbore & Son, 38 Great Tower street, London, E. C. 3.)
- 397,512 The word **FLYING**—artificial leather. The British Airless Tyre Co., Limited, Wells Road, Westfield, Radstock, Somerset.
- 397,722 The word **HERWHIT**—rubber and gutta percha goods not included in classes other than Class No. 40. Herbert Whitworth, Limited, Whitworth House, 115 Princess street, Manchester.
- 397,757 The word **INDRO**—rubber and gutta percha goods not included in classes other than Class No. 40. F. E. Freeman, A. E. Derrick, and C. L. Lowrey, trading as partners, 23 Lansdown Parade, Cheltenham, Gloucestershire.
- 397,871 The word **BREITFELD**—pressure cages and indicators for vulcanizing plants. The Dental Clinic & Engineering Co., Limited, New River Works, New River, London, N. W. 40.
- 397,880 Representation of a jay in a bush and the initials and word J. T. Loxton—all rubber goods included in Class No. 11. James Tompkins, Limited, 386, City Road, London, E. C. 1.
- 397,881 Representation of a jay in a bush and the initials and word J. T. Loxton—all rubber goods included in Class No. 40, not included in other classes. James Tompkins, Limited, 386 City Road, London, E. C. 1.
- 397,890 The word **ALMISON**—balata belting. The General Commercial Co. of London, Limited, 114 Cannon street, London, E. C. 4.
- 398,087 The word **MAGNUM**—golf balls. The Dunlop Rubber Co., Limited, Dunlop House, Albany street, Regent's Park, London, W. W. 1.
- 398,195 Representation of a label bearing the words **GREYHOUND TIRES** and **TUBES**, with a tire rolling along the roadway of a landscape, pursued by greyhounds, and the words **ON THE TRAIL OF A GOOD TIRE** in the foreground—tires and tubes. North Western Motors, Limited, Mersey Chambers, Covent Garden, Liverpool.

AUSTRALIA. TO AMERICANS.

- 22,986 Representation of seal bearing words **THE "ANTI-COLIC" BRAND, THREE-HOLE NIPPLES, BALL TOP**—rubber nursing nipples. W. W. Menzies, New York City, U. S. A.
- 23,946 Representation of setting sun, with words **SUN BRAND**—rubber on mackintosh clothing, rubber boots and shoes. Gutta Percha & Rubber, Limited, Toronto, Ont., Can.
- 23,978 Representation of Maltese cross with company's name inside round band—rubber or mackintosh clothing, rubber boots and shoes. Gutta Percha & Rubber, Limited, Toronto, Ont., Can.
- 23,979 Same as No. 23,978—rubber hose, packing, etc. Gutta Percha & Rubber, Limited, Toronto, Ont., Can.
- 23,980 Same as No. 23,946—rubber hose, packing, etc. Gutta Percha & Rubber, Limited, Toronto, Ont., Can.
- 24,713 The words **HALF SLOE TIRE**—tires. Gates Rubber Co., Denver, Colo., U. S. A.
- 25,075 The word **TESTES**—brake lining. American Asbestos Co., Norristown, Pa., U. S. A.
- 25,191 Representation of a face within a tire and the word **LEE**—tires, inner tubes, patches, rubber belting, etc. Lee Tire & Rubber Co., New York City, U. S. A.
- 25,417 Representation of a star within the word **STAR**—tires, patches, tire liners, retread beddings, etc. Star Rubber Co., Akron, O., U. S. A.
- 25,662 The letters **N** within a circle—tires, casings, and inner tubes. The Norwalk Tire & Rubber Co., Norwalk, Conn., U. S. A.
- 25,910 The word **SWATH**—rebuild tires, tire casings, inner tubes, etc. S. H. Goldberg, Chicago, Ill., U. S. A.
- 26,062 Representation of cord tire around firm name, which in turn encircles the figure of a globe with diagonal markings—rubber or gutta percha goods. The Manhattan Rubber Manufacturers Co., Passaic, N. J., U. S. A.
- 26,063 Same as No. 26,062—packing and hose. The Manhattan Rubber Co., Passaic, N. J., U. S. A.
- 26,385 The word **RAYNSTAR**—rubber clothing. United States Rubber Co., New Brunswick, N. J., U. S. A.
- 26,424 A red disk on end of tire—fountain pens. The Evans Dollar Pen Co., Waterloo, Ia., U. S. A.
- 26,425 The words **THE KNOX**—carpets, suspenders, belts, etc. The Ohio Suspenders Co., Mansfield, O., U. S. A.
- 26,428 The words **VITALE**—pneumatic tires and tubes. Continental Rubber Works, Erie, Pa., U. S. A.
- 26,461 Representation of a liberty cap above the word **LIBERO**—rubber tires. Liberty Seal Products Co., Inc., New York City.
- 26,563 The words **KELLY SPRINGFIELD** within a circle—pneumatic tires. Kelly-Springfield Tire Co., New York City, U. S. A.

NEW ZEALAND. TO AMERICANS.

- 14,472 Representation of a label bearing the words **THE "ANTI-COLIC" BRAND THREE-HOLE BALL TOP NIPPLES, etc.**, with notice of registration in the United States and Canada of the trade mark "**ANTI-COLIC**" on a blue label on each nipple—rubber nipples for nursing bottles. C. W. Meinecke, 48 Park Place, New York City, U. S. A.
- 15,723 Representation of an arrow pointing toward the left—chewing gum. William Wrigley Junior Co., 5 North Wabash avenue, Chicago, Ill., U. S. A. (Associated with No. 13,319.)
- 15,760 The word **EXTERCO**—tire patches. W. C. Wood, trading as W. C. Wood Co., 74 Western avenue, Minneapolis, Minn., U. S. A.
- 16,321 The words **VELVET GRIP** in fancy script letters—hose supporters. George Frost Co., 551 Tremont street, Boston, Mass., U. S. A. (Associated with No. 14,991.)

DESIGNS. THE UNITED STATES.

- NO. 12, 711. Patented March 23, 1920. Term 14 years. A. L. Dreifstein, Akron, assignor to The Knox Tire & Rubber Co., Mount Vernon—both in Ohio.
712. The word **TRIP**—pneumatic tires. S. A. Andrews, 4 Marlton avenue, Great Crosby, Liverpool.

Review of the Crude Rubber Market.

NEW YORK.

THE CRUDE RUBBER MARKET was dull throughout April with a sharp decline toward the end of the month. The little trading in evidence was purely speculative, as the manufacturers continued to refrain from buying. The large arrivals of crude rubber continue and the rate of exchange and the strikes may have affected prices. Parés were dull, with little trading and little change in prices.

Prices for plantation and South American rubber at the beginning and toward the end of the month are shown in the following quotations:

PLANTATIONS. April 1, first latex crépe, spot 46½ cents; May-June, 47½ cents; July-September, 48½ cents; July-December, 49½ cents; January-June, 1921, 51½ cents; April 26, spot, 42½ cents; May-June, 43½ cents; July-September, 44 cents; July-December, 44½ cents; January-June, 1921, 47 cents.

April 1, ribbed smoked sheets, spot, 46 cents; May-June, 47½ cents; July-September, 48½ cents; July-December, 49½ cents; January-June, 1921, 51½ cents; April 26, spot, 42½ cents; May-June, 42½ cents; July-September, 44 cents; July-December, 44½ cents; January-June, 1921, 47 cents.

April 1, No. 1 amber crépe, spot, 46 cents; May-June, 46 cents; July-December, 47 cents; April 26, spot and futures, 45 cents.

April 1, No. 1 rolled brown crépe, spot, 40 cents; May-June, 40 cents; July-December, 40½ cents; April 26, spot and futures, 35 cents.

SOUTH AMERICAN PARÁS AND CAUCHO. April 1, spot prices: upriver fine 42 cents, islands fine 41½ cents, upriver coarse 31 cents, islands coarse 21½ cents, Cameté coarse 22 cents, caucho ball 32 cents.

April 26, upriver fine 42 cents, islands fine 40-41½ cents, upriver coarse 31 cents, islands coarse 22 cents, Cameté coarse 22 cents, caucho ball 31½ cents.

RECLAIMED RUBBER.

Essentially the same conditions which prevailed in the reclaimed rubber market during February and March controlled the situation of reclaimed in all grades during April. Reclaimers are oversold for from two to three months, consequently are not seeking business. Prices, however, have not been advanced and remain as reported last month. Current buying is in relatively small volume and large users are not seeking to make commitments beyond the middle of the year.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the market for crude rubber paper, Albert B. Beers, 1 Liberty street, New York City, advises as follows:
"During April there has been a fair demand for paper from out-of-town banks, but New York banks have been buying very little. Rates on the best rubber names have ruled at 7 to 7½ per cent, mostly the higher rate."

SINGAPORE RUBBER MARKET.

GUTHRIE & CO., LIMITED, Singapore, report [March 4, 1920]:

The usual weekly auctions held yesterday and today opened with a steady demand for all grades (with the exception of fine pale crepe) which continued throughout the sales. Fine pale crepe, which was distinctly out of favour, and of which only a few lots were sold, realized up to \$1.07 (two lots sold at \$1.08½ and one lot at \$1.07½) or 1½ cents lower than last week's price. Ribbed smoked sheet fetched up to \$1.10½, or the same as last auctions. The lower grades sold at from 1½ to 4 cents below last auction's prices. Out of 1,168 tons catalogued, 945 tons were offered and 457 tons sold.

The following is the course of values:

	In Singapore, per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked.....	107c @ 110½c	2/ 8½ @ 2/ 9½
Sheet, good ribbed smoked.....	105c @ 107c	2/ 8 @ 2/ 8½
Crepe, fine pale.....	107c @ 107c	2/ 8½ @ 2/ 9
Crepe, good pale.....	99 @ 104	2/ 6½ @ 2/ 8½
Crepe, fine brown.....	82 @ 100	2/ 4½ @ 2/ 7
Crepe, good brown.....	87 @ 91½	2/ 3 @ 2/ 4½
Crepe, dark.....	82 @ 88	2/ 1½ @ 2/ 3½
Crepe, bark.....	72 @ 83	1/ 11½ @ 2/ 2½

Quoted in Straits Settlements currency; \$1 = \$0.567 United States currency.

AMSTERDAM RUBBER MARKET.

JOOSTEN & JANSSEN, Amsterdam, report [April 1, 1920]:

The rubber market was again very quiet, for spot as well as for those parcels still in the boats arrived earlier. Sellers are still asking their former prices, in spite of the lower overseas markets. New York also quoted slightly lower prices. There was a little inquiry on our market, but only at cheaper prices. The unchanged outlook in the strike makes business very difficult, and the approaching holidays do not tend to make matters more lively.

On the terminal market there was only a limited turn-over, as there were more sellers than buyers, the latter only at lower prices. Taken all around our terminal market has kept very steady compared with foreign markets. Prices have ranged from 1.137 to 1.138½.

ANTWERP RUBBER MARKET.

GRISER & CO., Antwerp, report [April 1, 1920]:

We have no changes to report, prices continuing depressed, although now they are at the same level as before the war. The price of Sumatra smoked sheet is 14.20 francs. The stock of india rubber at Antwerp is 560 tons.

As usual at Easter time, the future market shows absolutely no dealings; lack of interest everywhere. The closing price for the next twelve months is 13.40 francs.

BATAVIA RUBBER MARKET.

HERMANS, MARSMAN & CO., Batavia, report [December 16, 1919-January 15, 1920]:

A good demand prevailed during the first week under review and prices increased as far as 1.48 florins for prime smoked sheets and fine pale crepe, ready delivery. Afterwards the tone of the market became dull and prices dropped quickly, on account of the decreased rates of exchange on London and Singapore. The market closed with a slight improvement and small lots changed hands at: 1.44 for fine pale crepe, 1.41 for prime smoked sheets and 1.45 for off crepe, while low grades remained without interest. At the moment there is some demand for forward deliveries at 1.44 for prime grades.

THE FUTURE OF THE RUBBER MARKET.

W. H. RICKINSON & SON, of London, supply the following information to assist those who are desirous of making a forecast of the world's future production and consumption of crude rubber:

Taking the actual world's consumption of rubber during 1919 at 320,000 tons, an annual increase of 15 per cent would raise the demand to 643,634 tons in 1924. To meet this, plantation estates would have to yield an average of between 450 and 475 pounds per acre (see Table C).

Consumption of rubber in the United States has shown an average annual increase of 27.7 per cent during the past ten years (see Table F).

The increased demand for rubber in the United States during the war was mainly for home consumption.

Should an increasing world demand be maintained at about 25 per cent per annum, it would necessitate a yield from the whole planted area in bearing of 716 pounds per acre to meet it. It takes a shorter period to increase output on estates from 200 pounds to 300 pounds per acre, than from 300 pounds to 400 pounds.

Most of the rubber produced is used for the manufacture of tires, and if this demand is maintained during the next few years there will not be enough rubber available, as only the present planted area (2,910,750 acres) will be tappable during the next five years.

The average production during the last five years from Brazil has been 35,171 tons, and of wild rubber for the same period 10,197 tons.

The central European countries were large consumers before the war and during the next few years their requirements will no doubt be renewed on an increasing scale.

The largest tire manufacturer in the world—an American concern—contemplates increasing its output this year by 30 per cent over 1919.

As far as can be judged at the present time the years 1921-1923 will be as interesting for the rubber industry as were the years 1909-1911.

PLANTATION PRODUCTION.

Table A.
ACTUAL.

	ACRES IN BEARING.	TONS.	POUNDS PER ACRE IN BEARING.	ANNUAL INCREASE OF AREA IN BEARING.
1910	116,500	8,200	157	139.6%

1919	2,181,050	285,225	293	

Table B.

FOR ESTIMATING.

This table is intended to assist in arriving at a forecast of the Plantation production for the years 1920-1924 inclusive, according to the pounds per planted acre in bearing assumed to be yielded and indicated in the figures at the head of each column.

	POUNDS PER ACRE.	350	425	450	500	550	600	ACRES IN BEARING.	PERCENTAGE OF INCREASE.
1920	358,399	383,998	409,598	435,198	460,798	486,398	511,997	563,196	5.2%
1921	384,211	411,635	439,098	466,541	493,985	521,429	548,872	603,759	7.2%
1922	409,023	437,168	464,632	492,095	519,548	546,991	574,434	641,179	7.6%
1923	431,242	462,045	492,848	523,651	554,454	585,257	616,060	677,666	5.6%
1924	454,804	487,200	519,776	552,262	584,748	617,234	649,720	714,692	5.4%
		7.1%	6.6%	6.2%	5.8%	5.6%	5.2%	10%	

Table C.
WORLD'S PRODUCTION.

45,000 tons are here apportioned annually for rubber other than plantation grown, i.e., 35,000 tons as coming from Brazil and 10,000 tons of wild rubber as coming from Africa, Central America, Mexico and other parts of the world. These quantities are added to the figures in Table B, and the results shown in the columns below indicate the world's total production according to the pounds per planted acre in heaving assumed to be yielded by the plantations.

	1920	1921	1922	1923	1924
..... tons	403,399	428,998	454,598	480,198	508,798
..... tons	429,211	456,635	484,698	511,341	538,985
..... tons	453,023	485,168	511,313	540,456	569,601
..... tons	476,242	507,045	537,848	568,651	599,454
..... tons	499,804	532,290	564,776	597,262	629,748
..... tons					662,234
..... tons					694,720
..... tons					759,692
..... tons					824,664

*Pounds per acre yield of plantation rubber in heaving

Table D.
WORLD'S CONSUMPTION.

(On the basis of an actual consumption of 320,000 tons in 1919.)

PERCENTAGE OF ANNUAL INCREASE	1920	1921	1922	1923	1924

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE MARKET for rubber scrap has continued in the unsatisfactory state that characterized it for the past few months. It might be described as non-existent.

The New York harbor strike, car shortage and the switchmen's strike brought the rubber scrap business to a full stop about the middle of the month. Buyers are so few and sellers so numerous that prices are seriously cut to make sales. Reclaimers are busy but are not active in the scrap market. Dealers have held their prices on shoes unchanged and no change has been noted in tire scrap. Warehouses are filled to overflowing, awaiting a hoped for demand. Lack of foreign shipments is held largely responsible for present scrap values.

The new Atlantic freight rates for waste rubber are thought by traders to be prejudicial to the trade, one merchant stating that they would kill the business, as it would not pay to collect the material when it was burdened with so heavy a charge for shipment.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

AMERICAN COTTON. The market continued quiet and very dull, "no sales" being the record for every day save one. The spot price for middling upland cotton was 41.75 cents on April 1. It rose to 42 and 42.50 cents in the second week, to 43 cents the third week, then dropped for a few days, reading 41.45 cents, and on April 27 was 42 cents again.

Planting is late owing to the wet weather and perhaps in some degree to the request of the Government observers, who hope to avert the ravages of the Egyptian pink boll worm, which has made its appearance in Texas and some parts of Louisiana.

EGYPTIAN COTTON. Some business was done in upper Egyptian cotton in the last half of April, mainly on firm offers made by spinners. The upheaval in the Egyptian market, due to the native growers becoming excited over the high prices paid, has continued and limited the amount of business, making it impossible for exporters to send out firm offers. The demand for spot cotton in Alexandria continues, the selection is growing poorer, and those who have it are advised by brokers to put in their orders without delay. Conservative observers believe that the acreage for the new crop will not be increased materially, owing to government restrictions, as the ground is needed for food crops. There is complaint of a deficient water supply but the new crop, though late, is doing well. One result of excessive prices is to drive customers for tire fabrics toward using short-staple cottons instead.

ARIZONA COTTON. The last of this year's crop of Arizona Pima has been sold and only two or three hundred bales are now available. The reports are that a much larger acreage has been planted and that the Arizona cotton may be looked upon to supply the deficiency in Sea Island cotton and to avert excessive prices for the Egyptian long staples.

SEA ISLAND. For the time being the boll weevil has killed the American Sea Island cotton and whatever crop is raised will be so small as to be negligible. Increased production in the West India Islands will have little effect on the deficiency, while the promise of relief from new cotton countries, save in the case of Peruvian mitaffi, is purely speculative.

COTTON FABRICS. The demand for all rubber fabrics continues actively and supplies are very scarce. Prices of ducks, drills, sheetings and raincoat fabrics have advanced. There is no change in the market for tire fabrics as conditions are practically the same as last month.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE CONDITIONS of active demand and short supply in practically all lines have continued the past month with the situation for the latter half of this time still further complicated as regards deliveries due to the railroad strike, now virtually over.

ANILINE OIL. Urgency of demand during the railroad strike raised spot prices to 38-40 cents per pound.

BARYTES. Car shortage and cessation of freight haulage caused contracts to be withdrawn and new business refused. It will be sometime before normal conditions will prevail with the producers.

BENZOL. The demand has been heavy. Before the strike makers were sold up and the pronounced shortage resulted in sales of 90 per cent at 28-30 cents.

BLACKS. The supply of both carbon and lampblack falls short of meeting the consuming demand.

CARBON BISULPHIDE. The supply is restricted and prices firm.

CARBON TETRACHLORIDE. The price is dependent on that for carbon bisulphide. The unusual demand and short supply resulted in firm prices, which have held steady the entire month.

DRY COLORS. Scarcity of basic chemicals has advanced prices of most dry colors.

LITHARGE. The demand exceeds the supply which has been still further reduced by the railroad strike.

LITHOPONE. Production is entirely sold up to January 1, 1921. The price is strong at 8 cents.

SUBLIMED LEAD. Demand is in excess of the supply. Prices have advanced to 10-10½ cents.

SULPHUR. Supplies reported ample, demand steady and prices firm.

WHITING. There is promise of an increase of chalk supply soon from England. Until this is effective whiting will be difficult to obtain in large volume.

ZINC OXIDE. The growing active demand followed by decreased production under the influence of the railroad strike may possibly lead to an advance in price.

"Buflovak"

Vacuum Dryers for Rubber

There is ONE SURE WAY to keep yourself from being disappointed when buying vacuum dryers—and that is to ADHERE to the policy of buying quality. Even though you may pay a little more at the start, you are sure to PAY LESS in the end.

"Buflovak" Vacuum Dryers
Vacuum Shelf, Rotary and Drum Dryers
Impregnating Apparatus—Condensers
Dry Vacuum Pumps
Solvent Reclaiming Apparatus

"Buflovak" Evaporators
All types and for any capacity

"Buflokast" Chemical Apparatus

Apparatus furnished for all standard chemical operations, such as nitration, reduction, denitration, sulphonation, caustic fusion, crystallization, etc. Complete chemical plants.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**A SETBACK TO FILIPINO PROGRESS.**

IT has been an open secret that for some months past American capitalists have been striving to reach some agreement whereby acreage of jungle land could be secured to plant rubber on a scale comparable with Far Eastern enterprises.

The rubber offer was to plant 100,000 acres in Mindanao, and incidentally to establish a factory in Manila. At the same time another group wished to acquire sufficient wild land to install a vast camphor plantation. These two offers were the result of Filipino propaganda asking for American capital and the assurance from prominent officials that every facility would be afforded to investors.

The stumbling blocks were the existing law that no company can acquire more than 2,500 acres and the law against the importation of Chinese or other plantation laborers. These laws the Filipinos refused to amend. The offers have been therefore withdrawn, and the Philippines lose their chance probably for all time.

One would like to comment severely on the crass folly of such a course. The Filipinos clamor for capital and make investment impossible; they agitate for independ-

ence and show absolute incapacity for self-government. They are ready for neither.

GUAYULE IS RUBBER, NOT A "SUBSTITUTE."

ONE of our esteemed contemporaries, in an otherwise excellent article on "Attempts at Rubber Substitutes" hardly does justice to guayule; indeed, leaves the reader with the impression that it is poor stuff at best. Speaking of Mexican beginnings, he says:

"This experimentation resulted in a certain measure of success in that a low grade material was manufactured which was a capable substitute for the poorest grades of rubber."

The poorest grade of rubber is perhaps untreated pontianak or jelutong, which at one time was a drug on the market at 4 to 6 cents a pound. Even in its beginnings guayule was worth much more than that. It was, of course, a "capable substitute" for low grade rubber, but so was Pará rubber. It is not, however, low grade. On the contrary, well prepared guayule is classed among the medium rubbers.

Farther on the writer says:

"One mill was built in Torreon, in the State of Coahuila, where business was carried on successfully for some time. At the period of its greatest prosperity about 600,000 pounds of rubber, or whatever this low grade material might be called, was turned out each month."

The Torreon product was sold as rubber for the very good reason that it was rubber and a very excellent product at that. Certain of the old timers were against it from the first and insisted that it was a substitute and that in spite of the fact that any fair definition of the word "rubber" must perforce include guayule.

At present guayule is quiescent but, our contemporary to the contrary notwithstanding, it will again be a big factor and that within a decade.

BALATA CULTIVATION.

RUBBER CULTIVATION is so big and so successful that it is to-day a commonplace achievement. This in spite of the fact that it was deemed a "pipe dream" by trade leaders during its beginnings. The needs of the world brought it about just as the need for plastics, gutta percha, balata and chicle will in turn bring about plantations that produce these gums.

Of course the problem is a more difficult one. The *Sapotaceae* are slow-growing trees and the product is not large. Nor do any of them show the "wound response" that proved such a boon for the *Hevea* planter. Nevertheless, one should not forget the large gutta percha plantations in Java instituted by the farsighted Dutch.

It is also gratifying to note that balata is being grown in the Dutch East Indies in a small way, to be sure, but it is a beginning. The British Government

JUN 1 1920

is also doing its bit in using the "bully tree" in reforestation in the West Indies and in its African possessions.

The *Mimosa balata*, while it does not produce a gutta equal to that from the *Palaquium*, has an advantage in that the wood is of great value for building purposes.

Now if chiclé could have its turn and become a plantation product the *Sapotads* would be receiving at least a fair chance.

AIR FORDS NOT AS YET.

THE CREATION by one of the big rubber companies of a pony blimp or "flyabout" has been hailed by some of the semi-wise as the beginning of an era when air travel will challenge earth travel. They assume to see a development akin to that of the Ford car in the motor world. It would of course be wonderful were it within the realm of reality but alas it is not, nor will it be in this generation. England experienced the same visions and dismissed them.

A recent report on this subject from abroad places the minimum price of the small blimp at fifty thousand dollars. As against the five hundred charged for the first Fords the difference is appalling. Indeed, in spite of the wealth the laborers are piling up day by day, and their courage in spending, few will feel able to purchase "flyabouts."

ACCIDENTS IN FACTORIES.

THE URGENT NEED of a more aggressive "Safety First" campaign by American industrial leaders was strikingly emphasized in reports submitted at the first annual Massachusetts Accident Prevention Congress. One of the speakers, C. W. Price, general manager of the National Safety Council, Chicago, and who was connected with the National Harvester Co., said that of the 2,000,000 American boys who in nineteen months went overseas in the Great War 47,949 were killed or died from wounds received in battle. Yet, he said, in the same period "126,000 men, women, and children were killed, 35,000 in industry, and 91,000 outside industry, 25,000 of the latter being children. In other words, during those nineteen months our boys were fighting on the other side of the water, there were 220 people killed in this country every twenty-four hours; and it would take a ditch forty-eight miles long and as wide as the ordinary sidewalk to hold the bodies of those 126,000 men, women, and children."

Such sacrifice of human life in the pursuits of peace, and depletion of labor that was never more urgently needed, were to a great extent avoidable, said Mr. Price, who quoted figures to prove that of 22,000 serious accidents reported by industry in 1919, fully 16,500 were preventable. He said that in 1,000 industries reporting, reductions of from 50 to 75 per cent in deaths had been

effected by joint cooperation of employers and employees, about one-third of the good work being accomplished by means of mechanical devices and the remainder by enlisting the active aid of shop foremen.

That effective safety work not only spared manufacturers large losses in death and accident claims, but actually helped in dividends was another contention of the speaker. Enlightened employers have found that the safety movement wins workers and gives a dignified standing to business life, as well as being a sound, profitable business proposition. While he was pleased to note much progress, the speaker lamented the fact that a recent survey showed that scarcely one concern in ten develops a proper cooperative spirit among its employees, whereby they can feel that their employers take a real, personal interest in their welfare and will second every effort they make to safeguard human life and limb.

STANDARDIZATION AND GOLF BALLS.

A LEATHER BALL stuffed with feathers, at one time led all others in the game of golf. Had this ball been standardized, in other words, if no golf matches could be played except with the feather-filled ball, it would doubtless still be used. And—the solid gutta and the Haskell would never have been known.

The corollary is that to standardize the present rubber-cored ball is to kill its successor, a lively durable ball that will sell at 20 cents instead of a dollar.

THAT THE UNITED STATES IS NOW AT THE PEAK OF ITS crude oil production is an accepted fact. Despite the energetic efforts being made to augment production and to discover new sources, the result does not warrant the belief that it can long offset the constant growth in demand for oil and its products. This means that solvent naphtha, of which the rubber industry is a large consumer, will be produced in steadily diminishing quantities unless some new source of supply is discovered.

STANDARD BRITISHERS MAY NOT MUCH LONGER REFER reproachfully to the "gum-chewing Yankees," for, judging by the trade statistics, their own fellow-countrymen are fast becoming Americanized in at least this one respect. Chiclé, once used in England as an adulterant of gutta percha, is now consumed there to almost as large an extent in the form of chewing gum. The change has come about almost wholly through the Great War. Munition factory workers especially cultivated a taste for the American product, and its popularity spread rapidly among the soldiers, giving comfort to the men on long marches or in the front trenches in France and Flanders where smoking was forbidden. During the last year of the war, 1918, England bought \$1,119,898 of the total of \$1,695,903 exported by the United States. The amount fell to \$771,144 in 1919, but 1920 is expected to show a large increase in sales of American chewing gum in the United Kingdom.

TYPE OF PUBLIC LAND STILL AVAILABLE FOR LEASE OR PURCHASE ON BASILAN ISLAND, ZAMBOANGA PROVINCE. PROVED RUBBER COUNTRY. ABOUT 90 PER CENT UNDER COGAN GRASS.

Rubber (*Hevea Brasiliensis*) as a Philippine Agricultural Investment.

By H. F. Cameron, Lieutenant Colonel, Engineers, U. S. A.

GENERAL OUTLINE.

THE PROPOSITION outlined hereafter pertains to the production of plantation rubber (*Hevea brasiliensis*) as an agricultural venture for the southern part of the Philippine Islands.

LAWS.

The land laws (Organic Act of 1902) permit an individual or a corporation to secure a fifty-year lease (25 years original and 25 years renewal) of twenty-five hundred (2,500) acres of public land, while a corporation (three or more persons) may purchase at an appraised value, generally of \$2 an acre, after advertising and bidding. The annual lease rental approximates \$0.10 an acre for the first ten years, with increase upon new appraisements made periodically.

These laws forbid the import of contract unskilled labor. The Insular Government does, however, contract with Americans for duty in the Philippines and has brought in Javanese skilled laborers for instruction or educational purposes. The irrigation and water power laws are liberal and sufficient for economical agricultural or industrial operation.

LOCATION.

The Provinces of Zamboanga, Cotabato and Davao (and small sections adjacent thereto), Department of Mindanao and Sulu, Philippine Islands, have been selected, after a thorough personal investigation of the entire Archipelago, as best adapted in land, labor and other economic factors to produce the highest returns for money invested in plantation rubber. This territory is included within North Latitude 5° to 8°, and West Longitude 121° to 127°.

CONDITIONS.

The soil in these sections is alluvial and mostly of volcanic origin; very rich in humus; in the open areas free from fungus growths and beetle breeding, decaying stumps or roots; and capable of constant refertilization from the adjacent mountain washes or the silty rivers available for irrigation and power purposes.

Of the available areas, some are already under cultivation by corporations or individuals who have acquired titles under the laws of the Philippines, while other areas may be leased or purchased as desired.

The climatic conditions of this section are peculiarly favorable to obtaining rubber production. The temperature ranges from 75 to 92 degrees; the relative humidity 70 to 85 degrees; the annual rainfall is well distributed and averages from 70 inches on Basilan Island, Zamboanga Province, on the west, to 140 inches

at the foothills on either side of the low watershed extending south from Mount Apo to Matutun in Cotabato and Davao Provinces; on the west slope of the watershed (Kidapawan and Kabakan) rainfall in the morning is unusual; the entire area is out of the typhoon belt, while the droughts, common to all tropical countries, are no worse here than in other tropical possessions.

LABOR.

The last census for the Philippine Islands shows a population of 10,320,000. The center of population appears to be in the north Visayan Islands, Cebu Island having the largest population per square mile, approximately 350. Mindanao, on the contrary, the only possible plantation rubber producing land of the Philippine Islands, or even under the shadow of the American flag, has the smallest population per square mile, approximately 18.

The unskilled labor wage in the Philippine Islands varies with the locality and in accordance with the economic law of supply and demand—from \$0.30 a day to \$0.60, the latter price in the agricultural sections of Mindanao.

GOVERNMENT.

The Organic Act of 1902, which included land, mineral and labor laws that are still in force, did not provide for the economic developments that were beyond the poor man to handle and yet not sufficient for the industrial user to become interested. Rubber is a commodity in point. The poor man can get a quick financial return for his investment in corn, rice, sugar and cotton; it is a matter of six to nine months. He may develop coconuts successfully through the five or seven years to production by the use of catch crops, but in rubber, which requires approximately \$200 an acre to bring to production, and a few other commodities the poor man has no catch crop opportunity and six or seven years is a long period to carry the financing when one has no other source of income than the agricultural returns from this land.

GOVERNMENT ATTITUDE TOWARDS CAPITAL.

The Philippine government officials realize that they themselves have not the capital to quickly develop the islands in agriculture, industry and commerce. That they do desire this development in accordance with existing laws is evident from the large government loans made (aggregating millions of pesos) to going concerns that were in financial difficulty. They prefer, however, industries that can operate under the present laws and where the Filipino can own the land. The sugar central idea is an extremely popular example of this development. For rubber and similar commodities, however, their laws were so framed by

early American administration that operation is possible only on a small scale—too small for either success or to interest capital.

Although the progressive Filipino realizes the economic features involved, his constructive efforts to remedy a situation to which he was never a party, have so far been unsuccessful. He still persists, however, and it is believed that his efforts will shortly be crowned with success.

RUBBER FACTS.

The main essentials for a successful rubber plantation are:

- (a) A cheap, abundant and dependable labor supply.
- (b) Large areas of well-drained soil in a proved rubber country.
- (c) Care in seed selection and the tree elimination with age.
- (d) An annual, well-distributed rainfall of over 60 inches with freedom from morning rains.
- (e) A temperature above 70 degrees F. and a relatively high humidity.
- (f) Freedom from winds.
- (g) Tree protection against deer, wild boar and other bark attacks.
- (h) Good land and sea transportation for export and import.
- (i) Favorable land leases or titles, taxes, and governmental attitude.
- (j) Efficient management.

The answer to these essential needs is:

That the labor is not at present adequate for a large acreage development in either supply or wage. For a large acreage—

40,000 hectares—the immediate call for the hard work would be for 10,000 to 20,000 laborers. To secure this number in the Philippines quickly, if it were possible, would result in curtailment of production in other necessary lines, accompanied by a raise in wages that would make competition with Dutch Far East colonies still more unfavorable. The present increase in Philippine population does not keep pace with their development, and, until the laws are amended to permit entry of abundant cheap labor, and this condition is remedied, a rubber plantation under present Far Eastern competitive conditions will not be successful.

Relative to large areas needed it is only necessary to state that the use of rubber is in its infancy. The United States uses about 75 per cent of the world's rubber, almost all of which comes through New York and London markets. The maximum producing age of a plantation is reached somewhere between its tenth and fifteenth year—the original 100 or 120 trees an acre originally planted being reduced by elimination as the trees and root systems expand. Although the individual tree under proper treatment produces more latex with each year of age, this increase per acre after the tenth year remains almost constant, due to trees eliminated. The 1920 requirements for one large rubber factory are 120,000,000 pounds of rubber, which is the maximum

output of approximately 100,000 hectares of land. Therefore, one sees the uselessness of talking in 2,500-acre (present maximum acreage possible to obtain under law) developments, which, under the maximum possible production would give operation to this factory less than four days a year.

In Java, in instances where rubber trees have been watched, recorded and rated like pedigreed cows for quantity and quality of latex produced, the result of seed selection and budding of tested poor producing young trees with cuttings from high producing trees, the result on an acre of trees over ten years of age is 500 pounds of rubber per acre per year. This, therefore, should be an important consideration in a new development.

The rainfall, temperature, humidity and freedom from wind conditions pertaining to the southern Philippines is more favorable in certain sections than others.

The protection of trees against destruction by animals, fire, or other causes during development is easily furnished by fencing and proper maintenance.

The transportation facilities on land and sea are construction features only. Local conditions are extremely favorable in this respect.

The land leases and titles for areas over 1,000 hectares (2,500 acres) cannot be obtained except by purchase of old church or Spanish concessions, none of which are in this section.

The taxes are very favorable while the government's attitude has always been kindly and helpful. There is no reason to believe that it will ever be otherwise.

Efficient management is very important here as elsewhere in the tropics. The selection of representatives who know local conditions as to laws, officials, labor and customs is essential.

ESTIMATE TO DEVELOP 1,000 HECTARES (2,500 ACRES).

In this estimate of cost to develop

THREE YEAR OLD RUBBER, BASILAN, SHOWING PATANI BEAN COVER.

a 1000-hectare (2500 acres) rubber (*Hevea brasiliensis*) plantation in the Philippines the experience of the Dutch Netherlands and English colonies in the Far East as well as that of going concerns in the Philippines has been considered. It is recommended from possible fungus considerations, as well as initial development cost, that heavy jungle areas be avoided and that cogan (a tall fibrous grass) land be selected and that, to keep down weeds, to make for the most economical maintenance, Patani bean (an evergreen with fertilizing and fire resisting qualities which is disliked by wild animals) be planted.

To make this estimate on a business basis it will be assumed that the rubber selling value will be \$0.40 a pound (present price is over \$0.60 a pound); that the plantation will be fully cleared and planted in two years and that a less than maximum acre year production will result. The following estimates are the result of careful consideration based on practical knowledge.

	Debit.	Credit.		
FIRST YEAR.			Rubber returns $100,000 \times 34$ lb. @ \$0.40.....	30,000
Land purchase 2,500 acres @ 1st payment 25%.....	\$1,250		Profit on store for fifth year.....	15,000

CONCLUDING REMARKS.

The total estimated cost to develop a 1,000 hectares (2,500 acres) rubber plantation in the Philippines is \$500,000 or \$200 an acre. Such a plantation properly developed should average 500 tons to 635 tons (400 to 500 pounds an acre year) of cripe rubber a year henceforth at a cost of from \$0.20 to \$0.30 a pound. This cost will work for a good profit until the peak is reached when the demand is exceeded by the production. It is then that the low production cost, wherever it may occur—it points to

Java and Sumatra now will prevail unless Philippine production is protected by United States import taxes on foreign raw or finished raw commodities.

The end of 1918 showed over 400,000 commodities of rubber in different conditions, while the end of 1919 showed an increase to 500,000 commodities with new uses developing daily, as the rise in price of wood, iron and steel permit the rubber substitute at a lesser cost.

Because of the tremendous initial and carrying cost of development, rubber is primarily a development for a large industrial consumer. The small planter will never be a source of supply for this commodity like the cotton raiser, nor can it be produced on the popular sugar central basis.

The Philippine Government has under serious consideration the necessary law changes to permit large responsible industrials to operate. Understanding the present situation as outlined above, it is believed that capital with faith and courage in the Philippine Government may take the maximum land area allowed by present laws and develop, using Filipino labor, with an assurance that amended laws will soon permit this operation to expand on as favorable a business basis as now pertains to

TAPPERS—FRONT ROW, YANKANS, REAR, FILIPINOS.

the rubber-producing Dutch Netherlands and British Colonies of the Far East.

A Layout of a Scientific Rubber Footwear Factory.

A COMPARISON of the plant lay-outs of the leading rubber footwear factories in this country reveals differences in plant arrangement which are easily explained. Many of these factories have been in operation for forty years or more, and frequent additions to meet the demands of increased production have assumed such proportions that the original lay-outs have been lost sight of entirely. There are cases, too, of exactly the reverse nature where in the centralization of certain classes of the product in separate plants, some factories for the time being find themselves utilizing more production space than efficient management would require.

SEQUENTIAL AND PARALLEL PROCESSES.

Rubber footwear manufacturing involves both sequential and parallel processes by which the raw material undergoes chemical and physical changes before it finally reaches the finished state. A light rubber, for example, has the following parts: upper, outsole, toe cap, heel foxing—known as the "gum work"; insole, lining, junior, cloth heel, joining strip, rough back, filler—grouped together, known as an "inside work." The "gum work" and the "inside work" are prepared for making in parallel processes which are in themselves sequential. Thus the linings have to be coated, laid in tables of forty ply for cutting; cut, counted, cemented and joined before they reach the makers' table. Similarly the outsoles have to be calendered and cut before they are ready for making. It is necessary that all parts be prepared and ready for making before the shoe is assembled or made. After the assembly, the process becomes purely sequential, varnishing, curing, stripping, trimming, and packing being the final operations.

The use of conveyors, which have speeded up production in tire manufacturing, is not suited to the production of footwear on account of the number and tackiness of the small parts used. Thus we find the hand truck still largely used in footwear factories.

INTERDEPARTMENTAL BALANCE.

Balance between the departments is most important, and the first step toward balance is an adequate lay-out. The chain of operations is only as strong as the weakest unit. The arrow which points to the direction of the productive flow, then, must keep as nearly as possible to a continuous course. Operations

must be grouped in departments according to their order, and the routing facilities must be adequate to keep the unfinished material in its continued progress through the plant.

Manufacturing can be classified, generally speaking, as either manufacturing to order or manufacturing to stock. Rubber shoes come under the latter class; that is, they are manufactured according to a stock design on orders or anticipated orders. This insures standard, permanent equipment and operations which are practically unaffected by changes in styles from year to year. Lasts change, but most factories have shops where they fashion their own, either of metal or wood. Metal lasts of aluminum have the advantage that they can be melted up and recast. Similarly, new styles call for changes in patterns and dies, but this is taken care of by the pattern department, a necessity in every shoe factory.

THE IDEAL BUILDING.

Owing to the large number and the comparatively skilled class of workers required for the industry, most of the plants are located in cities where land is at a premium. For this reason floor-space has increased in value and the tendency is toward high buildings. This simplifies the problem of expansion, however, as the addition of a night shift in the mill room can double the stock output, while the addition of another story to the making room will take care of the increased production.

The U-type of building, four stories high, has been chosen as best suited for manufacturing rubber footwear. The railroad siding runs parallel to the U, permitting the entrance of the raw materials at one end and the exit of the finished product at the other. The raw materials used are crude and reclaimed rubber, compounding ingredients, and cotton fabric.

STORAGE OF RAW MATERIALS.

Rubber should be stored in a cool, dry place such as is provided in the basement under the stores department A. Cotton cloth can be stored in room A, while compounding ingredients such as whiting, litharge, lithopone and sulphur are kept on the second floor B, adjacent to the compound room I, where they are kept in drying bins ready for use. Storage spaces M and R on the third and fourth floors are for a reserve supply of materials necessary in these times of uncertain markets and transportation.

POWER, HEAT AND LIGHT.

These are the next factors to be considered. A great many rubber shoe factories buy all their power, and unless the circumstances are exceptional it is generally cheaper to do so. It is assumed, therefore, that the electric power necessary to run the motors in the mill, calender, and cutting rooms is received from an outside source and reduced to the required voltage through transformers. Enough power to run the lighting plant can be made on the premises. Heating is by direct steam from the boilers located in room D, which also supply heat for the vulcanizers, mills, calenders, and heel presses. Machine shop E is placed between the arms of the U next to the boiler rooms and adjoining the mixing and calender rooms where the bulk of the heavy machinery is located.

COMPOUNDING.

We will now follow the productive arrow through the operations. First of all is the mixing of the compounds, which is done in a separate compartment B, next to the mill and calender room.

Despite the fact that compounds are no longer secrets in the fullest sense of the word, rubber manufacturers still closely guard their formulas. In one factory, known to the writer, the stocks are mixed in a separate building some distance from the mill room. In another, the mixing is done in the calender room with no pretext of secrecy. The sequence of operations calls for it being located next to the calender room, as is shown in the diagram. It is equipped with four 20 by 22 by 60-inch mixers, one washer, two 15-inch crackers, and two 40-inch refiners. The ingredients are weighed in the compound room T on the second floor and lowered to the mixers on a small lift or dummy

CEMENT, VARNISH AND SCRAP DEPARTMENTS.

The making of cement and varnish is done in two separate buildings apart from the main factory on account of the highly inflammable materials used. A scrap department is also located in an outside building.

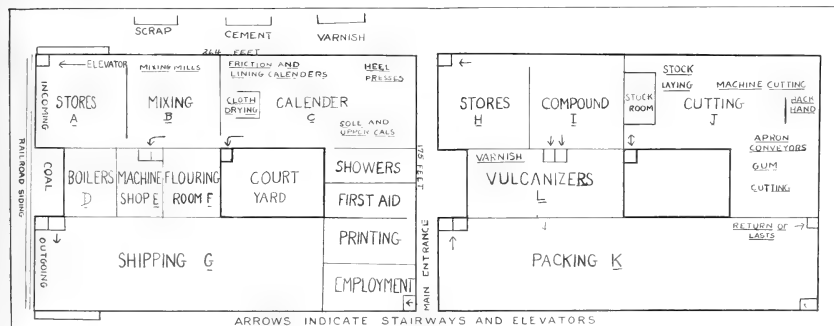

CALENDER ROOM.

In the calender room the work divides itself into three or four classes which call for grouping of machinery along these lines. The rolls of cloth are brought from the store room A to the cloth dryer in room C, where the moisture is removed before calendering. Three 4-roll calenders are provided for coating and frictioning cloth. This type is now generally used, the fourth roll insuring a more uniform gage in running the stocks. Each calender is provided with two mills for "warming up."

The heel department is equipped with a calender for laminating the stock, a beam cutting press for dicing out the blanks, three two-platen heel presses, one single platen press for molding fibre soles, and two heel trimming machines for removing the overflow. This semi-cured stock is returned to the mixing room, run through a refiner, and used again in fresh stock. The upper and outsole calenders complete the units in the department. For running uppers, two of the calenders are used for print uppers for gum shoes and a third for running plain sheet for boots and heavy all-rubber gaiters. Two outsole calenders complete the outfit.

MISCELLANEOUS PROVISIONS.

It will be noticed that all stock from these calenders is carried directly to the cutting room on conveyor belts. This prevents the soft upper stocks from being exposed to the necessarily dusty atmosphere of the calender room. The coated and fric-

SECOND FLOOR.

elevator. The rubber is weighed out near the mills. Most manufacturers break down the rubber before mixing, and one of the mills can be reserved for this purpose entirely.

The mixing of rag stock made of fabric scrap, reclaimed rubber, and cheap fillers which is used exclusively in footwear for coating insoles and inside pieces where a stiff compound is required, forms an important part of the work of this department. There is considerable truth in the statement that the cheaper the stock the harder it is to manipulate successfully. In the plan here shown the scrap from the cutting room is fed into a bin by means of a chute from the second floor. Bins are also provided for gum scrap which is worked back in the freshly mixed batches in fixed percentages to insure uniform stock.

tioned stocks are carried to the cutting room on an elevator which is used exclusively for keeping material moving between departments. Lastly, but not the least important, we have the foreman's office centrally located, that each section of his department may be under his eye at all times. A wash room with shower baths for the use of the mixers is a necessity in all rubber factories where accelerators of a poisonous nature are used. The first aid room is located on the first floor with a separate entrance and easily accessible to all departments.

CUTTING ROOM.

The cutting room J is the next department in the sequence and is located on the second floor directly over the calender

room. Rolls of friction, net linings, rag fillers, and tennis duck are brought from the first floor on the elevator and placed in the stock room, which is equipped with bins open at both ends. This enables the fresh stock to be placed at one end, and the oldest can be easily removed from the other. The best results are obtained when the stock is aged at least a week, and this requires ample storage facilities.

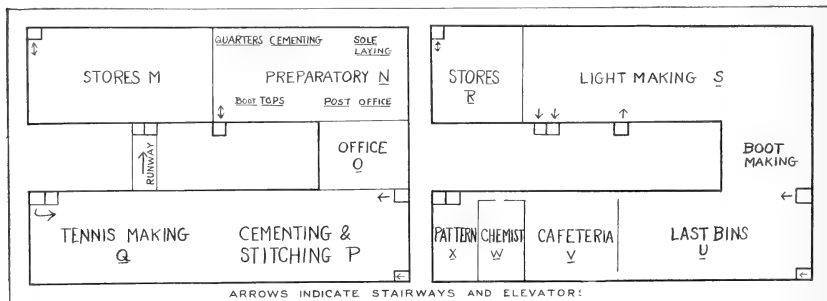

Six tables are reserved for laying off stock for cutting, and a revolving drum for plying up nets, frictions, tennis, and fleeces is also employed. Rag and insoling and the heavier stocks which need to be coated with whitening between the plys to prevent their sticking together, are doubled off by hand. Twelve cutting machines, six of the double clicker type, and six beam presses are stationed next to the stock laying tables. An overhead motor with belt drive furnishes the power. An overhead track arrangement with a siding for each table can be used effectively for carrying the stock from the drum and tables to the machines.

The clicker machines are used on light work, such as insoles, tennis, fillers, and linings, and the beam presses for the heavier stocks. Large patterns, such as boot leg linings, and smaller

may seem to be a departure from the lay-outs of many footwear plants. But analysis of the processes will show that they are all related and can be well controlled and supervised under one separate department.

The post-office section or stock cage is where all the inside work for gum shoes, tennis, gaiters, and boots is counted into sets for the different makers. These pieces are then prepared and cemented for the makers, some by hand, and others, such as insoles, cemented on one side, and juniors, and fillers cemented on both sides, by machines which convey the pieces to belts for drying. The insoles are carried the length of the room on an overhead belt to the making room above, where they are picked off by boys and made up into sets. Other preparatory operations in this department are top making for storm king and hip boots, quarter making, and sole laying where the outsoles for boots, heel tennis and lumberman's are made up with the heel and form sole.

The preparatory department is a very important connecting link between the cutter and maker, and to be operated efficiently it must have space enough to take care of all operations. If it is cramped for space, or, as in one footwear plant, its sub-

THIRD FLOOR.

FOURTH FLOOR.

LAY-OUT OF AN IDEAL FOOTWEAR FACTORY.

ones where the demand does not justify the purchase of dies, are cut by back hand cutters for whom five tables are provided adjacent to the machines. The cut stock is laid out on the tables at the head of the machines where it can be easily checked by inspectors, placed on trucks, and carried to the preparatory department on the next floor.

The scrap cage is placed near the drum so that the weights of the tables of stock can be obtained as they are laid off. The scrap from the cutters is checked and weighed here before being taken to the compound room and deposited in the chute. In the center of the room the successive operations of cutting and assembling vamps, counters, and legs for boot teams are carried on. In the gum cutting section, the sole cutting is done by machine and hand, print upper cutting on the zinc plates, and die cutting on the wooden block. The space in the center of the room is reserved for stock. A bias machine cutter located next to the back-hand cutters cuts all the strips for binding the edges of shoes.

In the gum cutting section the sole and upper stocks are taken off the aprons on books, frames, reels, and shells with a liner between the stock.

PREPARATORY DEPARTMENT.

The next step in the progress of production takes place on the third floor where the preparatory department N is located directly over the cutting room. The grouping of operations here

divisions are tucked away in odd corners of the shop, production cannot fail to be seriously hampered. Some means of ventilation must be provided here, too, for the obnoxious odors of stale naphtha make it difficult to obtain good help unless the air is kept fresh.

EXECUTIVE AND SALES OFFICES.

No space is provided for executive or sales offices in this plant. Usually, when the factory is within a short distance of the market for the product, the sales and executive offices are located there. Many concerns also prefer to have the auditing, accounting, and bookkeeping done outside of the factory. However, if the circumstances made it advisable to locate these departments at the factory a separate building could very handily house them. The office space indicated in O is for production managers, planning and ticket offices, and the keeping of production and cost records.

TENNIS MAKING ROOM.

The other side of the U on the third floor is devoted to tennis making entirely. In division P the parts are assembled, cemented, seamed, stitched, cycled, and put up ready for making in room Q. The runway to the elevators provides a passage for unfinished material from the preparatory department and an exit for the finished shoes on their way to the vulcanizers. The flouting room on the first floor is fitted up with blowers to

remove the excessive dust. All white tennis shoes are sent there before curing and buffed with a coating of talc or whiting.

VULCANIZERS.

The vulcanizers are located in L between the two sides of the U, directly over the boilers and next to the elevators from the making rooms with a direct exit on the other side to the packing room. Both steam and dry-cure heaters with several automatic varnish dipping machines form the major part of the equipment of this room. Shoes are placed on racks in cars which operate on rails throughout the plant.

GUM SHOE, GAITER, AND BOOT MAKING ROOMS.

On the fourth floor, the making rooms for gum shoes, gaiters, and boots occupy the largest position of the space. Room S has a capacity of 15,000 pairs of light gum shoes and gaiters, and room T 1,000 pairs of boots, making the total capacity of the plant, including tennis, from 20,000 to 25,000 pairs per day. The benches in the making room are 4 by 25 feet and fitted up with racks for linings, juniors, uppers, and outsoles and partitions for lasts. The foreman's office is placed on a mezzanine floor over the insole table. The last bins U are located conveniently to the making room and are connected with the packing room by a lift, permitting easy and direct return of the lasts after stripping. The pattern room and laboratory find a place with the restaurant between them and the bins.

PACKING ROOM.

The packing room receives the shoes from the vulcanizers, trims off the linings, strips the shoes from the lasts, inspects and packs them in case lots. Shipping space is confined to one floor as everything is sent to the jobbing house as soon as made.

ELEVATORS.

It will be noticed that there are six elevators in this plant, no more than are actually needed. Time lost in the routing of material is just as costly as lost labor within the sphere of departments. The writer recalls one shoe factory where two elevators carry all the incoming stores, deliver all unfinished work, and take all the shoes to the heaters. The loss of time in waiting, the resulting confusion, and the terrific drawback to production from this condition made such an impression when shown up by a time-study man that steps were taken to relieve it immediately.

INTERDEPARTMENT LAYOUT.

This important consideration requires even more careful study than the location of the departments themselves. Sufficient space must be had for the operator of a machine to work speedily, for the unfinished material as soon as it is turned out, for the machinist to make repairs, and for the waste to be removed. Aisles must be wide enough to allow free passage for trucks. The source and location of artificial and natural lighting must be considered. Ventilation, too, is important and there can be too much as well as too little. An example of this is brought to mind where a certain operation in a shoe factory had an abnormally high labor turnover. Men rarely stayed longer than two weeks on this particular job. Investigation brought out that the table was stationed next to the elevators which were constantly being opened on both sides, making a draft and considerable dust. To add to these discomforts, a constant procession of trucks was continually crowding by and interrupting the work. This one bit of poor lay-out cost this company many thousands of dollars in labor turn-over and spoiled material before it was remedied. It is very easy to lay out the principal occupations in a department and then to crowd the rest in somewhere, but it is only storing up trouble for the future.

The cost of supervision and management depends somewhat on the plant lay-out. The accompanying rubber shoe factory could be well handled by twenty-three foremen, whereas one manufacturing less shoes than this one requires twenty-nine.

Why? Simply on account of the lack of centralization of departments. But good lay-out is only a beginning for a successful enterprise. In the final analysis all the lay-outs in the world will amount to nothing if the "stuff"—the management by capable men—is not there.

RECENT IMPROVEMENTS IN TESTING MACHINES.

THE PENDULUM TYPE of testing machine has proved to be the most satisfactory form for use in rubber and fabric testing. By recommendation of Committee D13 of the American Society

for Testing Materials it is destined to be adopted as standard. Certain improvements have been made during the past year in the well-known Scott machine. For testing tire cords a lighter capacity head has been developed in order that autographic records of these tests may be made. The illustration shows the machine equipped for this work, although arranged for fabric testing and not for cord.

A new testing head of 80 pounds capacity, graduated by fifths of pounds, is now available for use on rubber tests in light gages. This head has the short swing of the pendulum lever, the maximum reading of the machine being reached inside of the 36 degrees of swing of the pendulum. This machine with its recorder has also proved valuable for taking adhesion or friction tests, and for this work it is advisable to reduce the speed of the pulling jaw to one or two inches per minute. This can be done by means of special gearing which can be readily changed by the operator.

A transmission gear equipment capable of producing a wide variety of speeds has been perfected. As ordinarily built it is

COMBINATION FABRIC AND CORD TESTER.

arranged to give speeds of the pulling jaw of the machine of one, two, six, 12 and 20 inches per minute. With a machine equipped with such a gear box, autographic recorder, and various styles of clamps, it is possible to do a wide range of testing on a large variety of materials. The recorder has been arranged to stop at the time of reverse of the machine, and is reset by the operator.

The Venturi or capillary type of pen has proved the most satisfactory form. With suitable ink this pen is capable of giving long service at one filling and a dry record as soon as it can be removed from the machine.

SPECIAL HEAD FOR LIGHT GAGE RUBBER TESTS.

Motor-Truck Efficiency as Related to Solid and Pneumatic Tires.

By S. V. Norton.

THESE are two ways of viewing the problem of pneumatics on motor trucks. One is to consider it in the light of future changes and improvements in truck design which may become possible through the use of air tires, and the other is to look at it from the position of the present-day operator who wants to know whether he can safely avail himself of the advantages claimed for them. In the one case it is like throwing the spotlight on the theoretical side of truck design to see what it may be like ten or fifteen years from now. In the other it is like asking an experienced business man or a banker whether, by making certain investments, you can save or earn some money.

While future improvements in truck design are highly important, they are of perhaps more interest to the designing engineer than to the operator of a truck built for present-day service. Hence, I have sought information from sources which would throw light on the problem of whether trucks as built to-day should use solid or pneumatic tires. The results of a nation-wide canvass of truck manufacturers, truck salesmen, and operators as well as tire dealers and those on whose local service the truck depends are set forth in this article.

WHY PNEUMATICS ARE USED.

At present, the accepted field for pneumatics appears to be on trucks up to 1½ tons capacity, and that for solids on trucks of 3½ tons or over. Between these two capacities the choice should be made only after a careful study of the important factors involved in each case. In order to ascertain why pneumatics were used, I asked several hundred motor-truck and tire salesmen as well as truck operators throughout the United States to state what they considered was their chief advantage in this debatable field. The following reasons were given, with the percentage of replies for each:

Advantage.	Per cent.
Greater traction	40
More cushioning	28
Higher speed	21
Lower repair bills	5
Saving in gasoline	4
More work possible	2
	<u>100</u>

Other reasons were given for the use of pneumatic tires but they were thought to be of secondary importance. They were: less breakage of load, reduced fatigue of driver, less depreciation of truck, reduced depreciation of roads, adaptability of truck to farm use, lighter weight trucks possible, and increased earning power.

DEPENDABLE INFORMATION LACKING.

The replies to my questions show a surprising lack of dependable information, as the following quotations will indicate:

"This question is one that comes up very frequently," said a large Eastern city truck agent, "and a complete discussion of the merits of the two types would be advantageous to us."

A tire salesman who has made many inquiries writes, "Some operators who have kept fairly complete records on gas, oil, and repairs say they have nothing they consider convincing as to comparative savings effected by pneumatics."

An exceptionally well-informed publisher in Chicago says, "Operators of large size pneumatics haven't had them long enough to decide as to their relative value. Moreover, it is surprising to find how few operators keep accurate cost records."

A Seattle tire agent says, "Operators using pneumatics have been entirely sold from a theoretical standpoint due to the mis-

statement work of the advertiser, with no analysis of conditions."

These remarks and many others of a similar nature indicate that a careful study should be made before deciding which type of tire should be used. The factors bearing on the problem may be divided into: (1) the engineering aspects involved; (2) the practical operating features encountered by the driver, and (3) the features of tire service in the community in which the truck is running.

OCCASIONS SOMETIMES arise when truck overloading is unavoidable. In such cases, solid tires prove their worth. The truck shown above carries 22,000 pounds of steel beams. This load was brought over bad stretches of road between Pittsburgh and Akron without mishap.

In taking up the engineering aspects I speak frankly as a layman and not as a truck engineer.

DISADVANTAGES IN CHANGING TIRE EQUIPMENT.

Before changing tire equipment from solids to pneumatics the operator should realize that, in order to gain certain possible advantages, he must face other definite disadvantages. In the first place he will have to cut down the wheels of the truck, which will prove a considerable item of expense. Moreover, proper allowance must be made for both body and fender clearance. It should also be remembered that the larger sectional diameter of the pneumatic tires will affect the steering clearance, and that the truck will be unable to turn in as short a radius as it did on solid tires.

As the larger diameter of pneumatic tires will affect the gear reduction, if substituted for solids, the mechanical ability of the truck will be affected. If the change is made, will the truck be able to "make the grade?" Will it materially affect the payload capacity of the truck? Will it reduce the ability to operate trailers? What will the effect be on the engine?

The increased maximum speed due to the larger diameter of the pneumatic tires will be relatively slight provided the engine is governed to run at the same speed as formerly. If the change is made to get more speed out of the machine, the gear ratio must be reduced, which reduces the ability of the truck, or the governor must be opened and the engine speed increased. There is danger here, however, as speed induces extra vibration, joints begin to loosen, and before long the engine may be literally racked to pieces.

Additional speed calls for greater braking ability. Brakes designed for slower speeds but used under more severe circumstances will inevitably require more frequent renewal. The question for the truck owner to decide before making the change is whether the truck can be equipped with brakes having much larger capacity, and if not whether it will pay to take the chance.

Of no less moment than the features mentioned above, so far as the dependability of the truck is concerned, is the question of air supply. Since pneumatic tires require from 90 to 160 pounds

¹The D. F. Goodrich Rubber Company, Akron, Ohio.

inflation pressure, hand pumping is out of the question and a power-driven pump on the truck or close at hand becomes a necessity. In many cases this is not practicable.

TRUCK MANUFACTURERS' OPINION IMPORTANT.

While these mechanical considerations apply particularly to using pneumatics on trucks now in operation on solid tires, most of the same problems are involved in changing the equipment on trucks manufactured but unsold. The truck buyer should satisfy himself that his agent's counsel on the equipment is based on positive facts and endorsed by the manufacturer. Otherwise he may expect more or less disappointment and dissatisfaction over the performance of his truck if he orders the equipment changed to pneumatics before delivery.

To sum up, since so many important technical features are involved, the operator or prospective buyer would do well to seek the advice of the manufacturer of his truck before changing the equipment. No one else knows so well the probable effect on various parts nor can advise more intelligently as to the probable loss or saving such a move would entail on the mechanism of his truck.

TRUCK EFFICIENCY DEPENDS ON SAVING TIME AND MONEY.

Let us now look at the practical operating features that must be considered in determining which type of tire will make the truck most efficient in service. Broadly speaking, the efficiency of a truck in performing its function depends upon the amount of time or money, or both, that is saved for the shipper, as compared with any other means of haulage. While it is difficult to separate all the factors bearing on these two items, they may be roughly classified as follows:

SOLID TIRES ARE INDISPENSABLE IN DELIVERY OF THE LOAD MUST REACH ITS DESTINATION WITHOUT FAIL AT TIME PROMISED IN REGULAR DELIVERY IS MORE IMPORTANT THAN FASTER SPEED OR COST OF DELIVERY, OR IF THE CAR CARRIES OVERLOADS BEYOND THE RATED CAPACITY OF THE TIRES.

The factors affecting time are: Distance of hauls; traffic congestion; speed of delivery; regularity of delivery; condition of roads (effect on speed of truck); number of trips per day; and time out for repairs, etc.

The factors affecting money are: Amount of pay load and overload; condition of roads (effect on tires and truck); number of trips per day; cost of operation; cost of upkeep, and cost of substitute equipment.

In what way does the tire equipment bear on these factors?

THE EFFECT OF PNEUMATICS ON TIME FACTORS.

Let us see how pneumatic tires may affect the time factors. If the operator is engaged in long-distance hauling with relatively few stops, pneumatic tires will almost invariably save running time, due to the fact that they absorb the road shocks so much more easily than solids. It should also be noted that the driver's fatigue in such cases is far less on pneumatics than on solids. Up to the present, however, comparatively few trucks are engaged

in long-distance hauling. The great majority of trucks operate in cities where they cannot possibly obtain a speed of over ten miles an hour. For such speeds there can be no possible saving in time which would offset the extra cost of running on pneumatic tires.

The condition of road surface has a very important bearing on the time element, as it has a direct effect on the speed of the truck. In fact, under certain circumstances the increased traction afforded by the heavy duty pneumatic makes it possible to operate the truck while it is equipped with solids it cannot be driven at all. This is particularly noticeable in rural districts where there are no hard-surfaced roads. One of the advantages frequently mentioned is the greater number of trips per day which may be obtained from a truck equipped with pneumatics. So far as this factor by itself is concerned, there is no doubt that the advantage is in favor of pneumatics.

There is one more important factor to be considered as affecting the time element, and that is the number of hours the truck is laid up for repair. Barring occasional lay-ups caused by defective material or workmanship, solid tires can be depended upon to give uninterrupted service from the time they are applied until worn down to the point. They can then be replaced without serious loss of time. Owing to the comparative vulnerability of pneumatic tires, they are far more likely to require time out for repairs and replacements. Punctures do not seem to be so frequent or so costly in point of time as blow-outs due to cutting and chafing of side walls from ruts, as well as to under-inflation and overloading.

When we come to compare the time out for causes other than tire trouble, we find a variety of conflicting claims, though it seems to me the evidence favors the use of pneumatics. It is claimed by some that the use of pneumatic tires accelerates the wear on certain parts, such as bearings, bushings and steering knuckles, and that a correspondingly greater amount of time is required for the adjustment and renewal. Moreover, many owners state that the use of pneumatics on trucks causes their drivers to overspeed and take more dangerous chances that result in accidents and time out for otherwise unnecessary repairs than is the case on solids.

THE QUESTION OF PAY LOAD.

The amount of work a truck can perform and hence the saving or profit it will show depends largely upon the amount it can carry; in other words, its pay load. There is a well-nigh universal tendency to overload trucks beyond their rated capacity and it is not uncommon to find trucks carrying twice their rated capacity. When it comes to standing up under this usage, there seems to be no doubt that solid tires will not only carry heavier overloads, but will last longer in such service. This seems to me the most important and least understood factor in the entire list. Apparent savings may be offset or overbalanced by the additional trips that become necessary when an overload cannot be carried.

Closely allied to the cost of overloading pneumatic tires is that of underinflation. The constant and extreme flexing caused by overloading has a tendency to weaken the side wall, making it much more likely to fail in service. While solid tires are not invulnerable they can stand more abuse and are less expensive to maintain in working condition. In addition to the likelihood of incurring expense from overloading and underinflation, there is the danger of ruining pneumatic tires from running them after being punctured or blown out. It is not uncommon for practically new tires to be ruined by drivers who do not stop their trucks as soon as they begin to suspect tire trouble.

In attempting to collect data as to mileage on pneumatics, I found many varying claims, ranging from 200 miles under adverse conditions to 25,000 miles on lighter trucks, over good roads with proper care. With rare exceptions the mileage delivered by solid tires is considerably greater than that from pneumatics in the same class of service. When the earning capacity of the truck

concerned is judged by the number of trips per day, the advantage seems to lie with pneumatic equipment, provided the runs are long enough and not restricted by such factors as traffic congestion and delays at terminals.

As I suggested before, there are certain conditions under which trucks on pneumatics can make trips when those on solids cannot be operated. Hence, their earning capacity is just so much greater. It has been noted that trucks on pneumatics not only negotiate the unpaved roadways more easily but do less damage

PNEUMATIC TIRES ARE USED BY THE ENGINEERING CORPS OF THE WAR DEPARTMENT ON TRUCKS WHICH CARRY THE HUGE SEARCHLIGHTS USED TO SPOT ENEMY AIRCRAFT. THE DELICATE MECHANISM OF THE SEARCHLIGHTS MAKES NECESSARY THE GREATEST POSSIBLE PROTECTION FROM ROAD SHOCK.

than those on solids, and hence are looked upon with more favor by the farmers they serve.

RELATIVE EFFECTS ON OPERATION COSTS.

When we come to consider the relative effects of solids and pneumatics on the cost of operation and up-keep we find a wide variety of opinions, but very few conclusions based on accurate cost records.

Let us examine briefly the items which should be included in such costs, and see how they are affected by solid and pneumatic tires. The following items are usually not affected by tire equipment: interest on investment; insurance; taxes and license; garage; supervision; wages of drivers and wages of helper. The following, however, may vary according to the type of tires used: depreciation; gasoline; oil; tires; repairs due to wear and tear and accident.

Taking them up in the order given, there are, so far as I know, no dependable figures covering depreciation on which to make comparisons, as no trucks have been run long enough on pneumatics to determine their effect on the ultimate life of the truck. As to the relative consumption of gasoline and oil, very few reliable figures are available, but the best-informed operators are inclined to feel there is little if any saving in these items, particularly on short hauls. On long hauls, however, the advantage seems to lie in favor of pneumatics.

When it comes to tires there is no question. The cost of pneumatics averages from two to three times that of solids. This is due to the higher initial cost of the equipment and the spare tires, their greater susceptibility to abuse and accident, and their lower average mileage.

So far as the cost of repairs to the truck is concerned, comparative data of a reliable nature cannot be obtained. The evidence indicates, however, that, except for the engine, the cost of repairs will be considerably less on pneumatics than on solids, due to the reduced vibration. And if the engine is not run at excessively high speed or continually overworked it will prove less subject to damage on pneumatics.

Summing up the factors affecting the saving of time and money, I have come to the conclusion that no general claims in favor of pneumatic equipment on trucks as a whole coming in the debate-

ble field can be substantiated, and that the work to be done by each specific installation must be analyzed carefully before either type of tires can be safely considered the more economical.

THE QUESTION OF SERVICE.

Having reviewed the engineering features and the practical operating features, let us now see what the operator faces in so far as tire service is concerned. As the nature and extent of service of the maintenance and renewal of solid tires are well known, it seems unnecessary to comment on them except to say that years of study and competition have developed this end of the business to a high degree of perfection, so that the operator can depend upon many well-equipped service stations for instant attention, either in the day or night.

The manufacture of heavy-duty pneumatic tires of six-inch section and larger, is, however, a relatively new development. Less than a third of the manufacturers of passenger-car tires have started actively to make heavy-duty pneumatic truck tires, for they realize that the job of building a tire which will stand up under the use and abuse to which it is subjected nowadays is not easy. Moreover, the task is not finished when the tire comes out of the heater. It must be sold to the dealer, who, in turn, must not only stand behind the tire, but place himself in position to give the truck operator service. This means he must install a high-pressure air-pump, repair material and molds for vulcanizing and in most cases a service car for emergency calls, as it must be remembered the tire is apt to fall away from its base and it cannot be driven home flat.

It may be said, without fear of contradiction, that the tire companies themselves are not as yet prepared to give really efficient service in all parts of the country. In fact, even in the principal cities this phase of the business has not been fully developed. In the smaller towns there are almost no air tanks or pumps to keep tires properly inflated. Pumps on trucks themselves are reported as not always dependable, sometimes re-

PNEUMATIC TIRES ARE INEFFECTIVE UNDER SOME COMBINATION OF THE FOLLOWING FACTORS: TRACTION ON ANY KIND OF ROAD SURFACE, OR OFF THE ROAD, WITH COST SUBORDINATED; SPEED WITH COST SUBORDINATED, OR WHEN PROTECTION OF MERCHANDISE FROM ROAD SHOCK IS ESSENTIAL.

quiring from 15 minutes to half an hour to secure the desired pressure in a tire.

PNEUMATICS DIFFICULT TO REPAIR.

By far the most serious and difficult phase of giving service with heavy-duty pneumatics, and that which causes the most concern to truck operators, is connected with the repair. In fact, the chief complaint in regard to pneumatic truck tires, aside from their high initial cost, is that they are subject to injuries, cuts and damage generally of such a nature that they cannot be repaired except at the factory where they are made, or in a few cities at a factory branch, and often they are damaged beyond all repair. This is not only expensive, but frequently necessitates the purchase of more than one set of spares should the first set be injured while the others are being re-

paired. Oftentimes the principal cost of punctures or blow-outs is due to the necessity of laying up trucks awaiting new tires, due to stock shortage, or sending the damaged tires to the nearest factory branch for repair. Moreover, repaired casings frequently deliver but small mileage due to the overcure of the joined portions. This danger is most difficult to overcome in the large sections due to the longer cure required to vulcanize the interior portions of the new part of the casing. No doubt this feature will ultimately be corrected. The tread seems to give less trouble than the side walls which are more susceptible to rut wear and overloading abuse.

FIELD OF USEFULNESS CLASSIFIED.

The field of each type of tire may be separated into three classifications within which the operator may reasonably place his installation, and select his equipment accordingly. These may be called: (1) The imperative field; (2) the economic field; and (3) the optional field.

The factors that would bring a truck within the "imperative" field for solid tires are: reasonably hard road surface, dependability of delivery, regularity of delivery, and heavy loads with frequent overloads.

If delivery must positively reach its destination without fail at time promised; if regular delivery is a more important factor than either speed or cost of delivery, or if it carries overloads beyond the rated capacity of the tires, solid tires should be used.

Similarly, the factors that would bring a truck within the "imperative" field for pneumatics are some combination of the following: traction on any kind of road surface, or off the road, with cost subordinated; speed with cost subordinated, or protection of merchandise from road shocks.

The factors that would bring a truck within the "economic" field for solid tires are: short hauls in cities where speed is relatively unimportant; heavy loads with tendency to overloads; traffic congestion which reduces average speed; loading and unloading delays and need for low delivery cost.

Similarly those that would bring the truck within the "economic" field for pneumatic tires are: road conditions which will not prematurely destroy the tires; long hauls; high average speed; relatively light loads with no overloads; tire service conditions good and low cost subordinated to quick service.

In analyzing the "economic" field the operator must decide first whether he can avail himself of the potential speed pneumatic tires would give him. This, of course, includes the possible delays he may encounter due to tire trouble as a result of bad road conditions and those he will find, provided the tire service conditions in his locality cannot be depended upon. Next he must be sure that the features of his service provided by pneumatics will justify their extra cost.

The distinction between "economic" and "optional" fields is difficult to make. In fact, the decision as to which is the better equipment may be purely a matter of personal opinion, without strong factors on either side. Hence, I shall not attempt to define them. One of the most interesting significant developments which I have noticed in studying this subject, however, is the growing tendency among truck operators to use pneumatic tires on front wheels where the need for protection from vibration is the greatest, and solids on the rear to carry the burden of the load. This practice has much to commend it, and should steadily grow in favor.

CONCLUSION.

The movement toward the use of pneumatics should not be condemned, however, for undoubtedly it will be the means of increasing the scope of usefulness of motor transportation. The question is too new to be decided theoretically or from such meager records as are now available.

In concluding, I should like to urge that designing engineers study to develop such cushioning effects as may be possible

through other means than tires, such as cushion wheels, improved springs, shock absorbers, etc. While I realize that no mechanical device is as resilient as air, we have a long way to go before we overcome the difficulties of making it serve us acceptably in puncture and fool-proof rubber tires, although the industry is making notable progress in this direction.

TWENTY-FIVE STORY OFFICE BUILDING FOR FISK RUBBER CO.

The new Fisk Rubber Company Building will be on the south side of Fifty-seventh street, New York City, running from Broadway to Eighth avenue, the site now occupied by the

THE FISK RUBBER COMPANY BUILDING.

Rutland and St. Augustine apartment houses. It will be twenty-five stories high, five stories higher than any other building north of Times Square. The front will be of brick and limestone, with rows of marble columns from the fifteenth to the twentieth floors, which are set in, giving a tower effect. The first floor, which will be 21 feet high, will be used as automobile showrooms. The Fisk company will pay a net annual rental of \$600,000.

The land and building for the Fisk structure will cost \$7,050,000. The corporation owning it is called the 1767 Broadway Company, of which H. T. Dunn, who is head of The Fisk Rubber Co., is president, and includes among its stockholders, besides The Fisk Rubber Co., the Wills-Overland Co. and the Wills Corporation.

The building will stand out prominently in the heart of the automobile district, as the industry promises to monopolize Columbus Circle before long. Close at hand are the salesrooms of the Chevrolet Co., the Kelly-Springfield Tire Co. and the Ford Motor Co.

NOSTIX COMPOUND.

Nostix compound, it is claimed, will prevent retread or sectional repairs from sticking in the molds. It is a blue-gray powder that is mixed with high test gasoline and applied with a brush to the old gum of retreads, sectional repair side walls and cold bead plates. After the cure it is brushed or washed off, leaving an azurine finish. (The Sick Manufacturing Co., Carmi, Illinois.)

Rubber Tariffs of Asia, Oceania, and Africa.

THE VALUE of the exports of manufactured rubber goods from the United States to Asiatic countries in 1919 was almost exactly double what it was in 1918, the bulk of the increase being in automobile tires and rubber shoes; the figures are \$5,222,693 for 1919 and \$2,675,636 for 1918. The largest customer, as usual, was Japan, which more than doubled its purchases, taking \$1,469,076 worth of American wares, against \$692,828 the year before, followed by the Dutch East Indies and British India with over \$800,000 each, and the Straits Settlements with over \$700,000. Japan bought more than three times as many tires, \$425,432 against \$118,685, and nearly six times the number of shoes, 393,679 pairs instead of 67,330; the quantity of miscellaneous rubber goods was more than doubled, \$276,280 instead of \$129,559. Siberia is opening up again after being closed to commerce; it took \$558,025 worth of goods last year and only \$12,097 in 1918. Tires accounted for \$266,674 of this, and rubber shoes for \$204,823. China's quota was over two and one-half times that of 1918, \$557,391 against \$197,342; of this, \$254,784 was for tires. The tire demands of British India (\$557,396), of the Straits Settlements (\$636,101), and of the Dutch East Indies (\$686,873) were also large increases and formed the greater part of their importations of American rubber goods.

In Oceania the increase of exports was slight, being \$5,158,885 in 1919 and \$4,875,147 in 1918. A falling off of over half a million in Australia was made up by increases in New Zealand and the Philippines. Australia and New Zealand each took over \$1,300,000 worth of American rubber goods, and the Philippines \$2,300,000. Preferential tariffs in the British colonies, strongly favoring goods from Great Britain, have been put in force in

each. Imports of tires in Australia fell from \$1,144,405 in 1918 to \$751,584 in 1919, while in New Zealand they rose to \$1,023,807 from \$950,985; in the Philippines the imports of tires were \$1,372,544 against \$982,224 the year before. There was a marked diminution of more than half in belting for Australia, while rubber shoes and druggists' supplies increased. In New Zealand the increase in belting and rubber boots was marked. With the British absorption of German Oceania and the elimination of the Philippines, the Oceanian statistics will refer almost exclusively to British possessions.

Exports to Africa rose in 1919 to \$1,676,014 from \$1,391,530 in 1918, over three quarters, \$1,294,798 worth, going to British South Africa, which seems to have become a steady and permanent customer for American goods. It took automobile tires to the amount of \$479,934, as against \$591,378 in 1918; belting worth \$564,972, instead of \$472,235, and miscellaneous rubber goods to the amount of \$136,183, instead of \$75,435. British West Africa took \$122,940 worth of tires as compared with \$43,948 in 1918. It may be noted that British East Africa took \$32,000. French Africa \$28,000 and Portuguese Africa \$25,000 of American tires in 1919. Belting to the amount of \$70,000 to the Belgian Congo seems to be an isolated case, but the \$50,000 of belting that went to Portuguese Africa follows on \$64,000 sent the year before.

The succeeding extracts from the tariffs of the principal countries of Europe show the competition to which rubber manufacturers of the United States are subject under existing tariff conditions. Owing to frequent tariff changes the figures and information given below should be periodically verified and small retail shipments made to test the rates.

UNITED STATES EXPORTS OF RUBBER GOODS TO ASIA, OCEANIA AND AFRICA.

121	Tires and tubes and other manufactures of rubber not otherwise specified	Ad valorem	7

CEYLON.

Equivalents.—Rupee, nominally 32 cents.

Crude rubber is exempt from import duty, but there is an export duty of 7.50 rupees per 100 pounds of rubber.

CHINA.

Equivalents.—Haitwan tael, 48.625 cents; picul, 133 1/3 pounds.

Description	Tariff Unit and Duty.
India rubber and gutta percha, crude	picul 3.140
Boots	pair 0.080
Shoes	pair 0.020
Waste	picul 0.250
All other articles of rubber	ad valorem 5%

DUTCH EAST INDIES.

The governments of West Coast of Sumatra, Celebes and dependencies; residencies Tapanohi, Benkoelen, districts Lampong, Palembang, Djambi, Banca and dependencies; West Division of Borneo, Mamboi, Ambonina, Ternate and dependencies; Timor and dependencies, and Billiton levy an export duty of 5 per cent ad valorem on rubber, gutta percha, and other gums.

The tariff for South and East Borneo is 8 per cent ad valorem on rubber, gutta percha and other gums.

The tariff for East Coast Sumatra, Indragiri division, Kateman territory, Riser, Danci, is 5 per cent ad valorem on rubber, gutta percha and other gums. For the Singkel division of Atjeh this is also 5 per cent, for Lampong 8 per cent, for Grand Atjeh and other portions of Atjeh except Way Island, 10 per cent ad valorem.

Exemption from duty (Dutch East Indies) is granted for plantation rubber and gutta percha, provided that the exemption be warranted by a certificate issued by a European official in charge of the administration.

On automobiles and accessories imported into the Dutch East Indies a duty of 10 per cent ad valorem is levied.

FEDERATED MALAY STATES.

Equivalents.—Dollar, about 56 cents; picul, 133 1/3 pounds.

32	4	4 1/2	5	6	7	8	26	
34	4 1/2	5	5 1/2	6	7	8	28	
36	5	5 1/2	6	6 1/2	7	8	30	
40	6	6 1/2	7	7 1/2	8	9	34	

Note.—The figure 71 in the marking in plates 10 and 11 refers to the number of the British Standard Report on Wheel Rims and Tyre Bands for Solid Rubber Tyres, and the figure 20 to the year of its issue (1920). Report No. 71 1920.

THE NEED OF TIRE STANDARDIZATION.

An analysis of the size of the tires used on the cars described in the "Handbook of Automobiles" shows how far we are from standard sizes, though the majority of the passenger cars use tires that differ less than an inch from each other.

On all the pleasure cars the front and rear wheels are of the same size and out of 151 pleasure vehicles 35 have wheels with tires 32 by 4, 20 measure 32 by 4 1/2, and 27 measure 33 by 4. The other measurements given are 35 by 5, 11 cars; 34 by 5 1/2, one car; 34 by 4 1/2, 24 cars; 34 by 4, one car; 33 by 5, 12 cars; 33 by 4 1/2, 5 cars; 32 by 3 1/2, 4 cars; 31 by 4, 5 cars; 30 by 3 1/2, 6 cars.

The variety in the tires of commercial trucks is far greater; out of 77 trucks, 25 have front and rear tires of the same size, and of these 7 take tires 36 by 5, with front wheels single solid and rear wheels dual solid, while two have single solid tires 36 by 5, both front and rear. Six trucks take size 36 by 4, front single solid, rear dual solid; six have pneumatic tires, one 36 by 6, two 35 by 5, two 34 by 4 1/2, and one 31 by 4. The other sizes of solid tires for cars with like front and rear wheels are 40 by 6, 36 by 7, 36 by 6 and 33 by 4, one of each.

With a few exceptions, in the case of dissimilar wheels, there are as many varieties of tire combinations as there are cars. Ten

cars out of 52 take 36 by 4 single solid tires for front wheels and 36 by 7 single solid tires for the rear wheels; 5 cars, 36 by 6 single solid front and 40 by 6 dual solid rear; 4 cars, 36 by 5 single solid front and 40 by 6 dual solid rear. The other 33 cars use twenty-six different sizes or combinations of sizes, ranging from 38 by 7 pneumatic and 38 by 4 solid to 32 by 2 1/2 solid for front wheel tires and 42 by 12 solid and 42 by 9 pneumatic to 32 by 3 solid for rear wheel tires.

One reason for the lack of uniformity in tire measurements is the great diversity in size and carrying capacity of the trucks, one being rated at 7 1/2 tons, 12 at 15 tons, 18 at 3 1/2, 11 at 2 1/2, 10 at 2, with cars of every intermediate and smaller capacity down to 1,000 pounds and 750 pounds.

WESTINGHOUSE EMPLOYEES INSURED.

An insurance policy for \$500 will be given entirely without cost to every employee of the Westinghouse Electric & Manufacturing Co. who has been in the service of the company for a period of six months or more, according to a plan effective March 1, 1920. In addition, the employees, after April 1, may increase the value of their policies to amounts varying from \$1,000 to \$2,000, depending upon their length of service and continuity of savings.

All employees who have been in the company's service for six months or longer and who deposit a sum each pay-day in the Employees' Savings Fund, equal to 2 per cent or more of their earnings, will not only receive 4 1/2 per cent interest compounded semi-annually on such deposits, but in addition will automatically have their insurance increased to amounts up to \$2,000, depending on the length of time they have been with the company. For example, a man who has been in the service of the company for at least 15 years and has regularly deposited in the Employees' Savings Fund 2 per cent or more of his salary is presented with an insurance policy for \$2,000.

After an employee has maintained the required deposits for a period of five years he may discontinue or withdraw his deposits from the savings fund without in any way affecting the value of his insurance policy.

In order to provide for employees who need money and do not wish to disturb their savings and thus affect their insurance, loans will be made by the company to the extent of 90 per cent of the amount to the credit of the employee in the savings fund.

This plan of insurance is to be made effective at all of the various offices and plants of the Westinghouse company and will affect approximately 50,000 persons.

The Goodyear Industrial University.

By Ralph C. Bushey.

IN AN EFFORT to more comprehensively and effectively humanize industry, and to further its fundamental principle of preserving the human element by building men and women as well as product, there has just been established in Akron by The Goodyear Tire & Rubber Co., an institution known as Goodyear Industrial University. It is not only the world's first industrial university, but an educational institution without parallel in the wide range of studies embraced in its curriculum, and in the democratic personnel of its student body.

Goodyear University with a faculty of 115, and an enrollment of more than 5,500 men and women, including executives, office employees and manual workers among the company's 35,000 Akron employees, has commodious and fully equipped quarters in Goodyear Hall, the newly dedicated recreational building, said to be one of the finest buildings ever erected by an industrial concern for the welfare and physical and mental developments of its employees.

A GREAT HUMANIZING EFFORT.

The Hall and University were dedicated simultaneously on April 17, when William Oxley Thompson, president of Ohio State University, paid tribute to the broad vision and fundamental principles underlying the motives of the founders of this institution, characterizing its establishment as one of the greatest humanizing efforts known to the industrial world. He predicted that the university would prove a potent factor in stabilizing industry, in allaying industrial unrest, and in bringing about a broader and better understanding between capital and labor and a more harmonious relationship between industrial heads and manual workers.

DEDICATED TO GOODYEAR MEN AND WOMEN.

A dedicatory tablet in the hall contains a thoughtful and abiding message that expresses the purpose of the institution. It reads:

GOODYEAR HALL.

To Goodyear men and Goodyear women, whoever they may be, a great army of people, touching hands around the globe; to education and fellowship; to the forwarding of every right ambition; to the realization for every man and every woman of his usefulness to self, family, company and country; to better understanding between man and man, between management and men; to mutual helpfulness and service; to the fullest loyalty to America and the fulfillment of her promise of moral, intellectual and industrial leadership among the nations; to loyalty and friendship and fair dealing and good will—to these purposes this building is soberly and prayerfully DEDICATED.

DOORS OF LEARNING OPEN TO ALL.

Fundamentally, Goodyear University is an industrial institution teaching such branches of academic and scientific work as are necessary to the development of American industry. Its doors of learning are open to all alike. It is for the lad 16 to 18 years of age, forced out of school to help support a fatherless family. It is for the foreign-born rubber worker anxious to become Americanized. It is for the illiterate, anxious to overcome his handicap and to learn the rudiments of American education. It is for the high school or grade school graduate who could not avail himself of the opportunity of a college education. It is for men and women whose college careers were incomplete and for college graduates anxious to go higher and train themselves along specific scientific lines calculated to fit them best for a further

pursuance of their vocation in the great rubber industry. It is for manual workers and factory foremen alike; for office clerks and office executives.

CURRICULUM EMBRACES WIDE RANGE OF STUDY.

There are 600 separate classes which are so conducted as to permit attendance of office employees and to factory workers from all three daily eight-hour shifts. Courses are provided ranging from the fundamentals of rudimentary grade school

education to the post-graduate courses in mechanical and chemical engineering and rubber chemistry and rubber technology, the curriculum embracing a wide range of study. There are four distinct divisions, the production school, sales school, school of commerce and school of household arts. A few of the specialized studies are mathematics, mechanical drawing, physics, chemistry, engineering, personnel in business, better letter writing, organization management, corporate organization, finance, business economics and effective stocking. These latter courses are more specifically for executives and office employees aspiring to executive capacity.

Members of the production or flying squadron, men who are either experts or studying to become proficient in factory production matters, are offered a three-year specialized course, upon completion of which diplomas are granted with a degree of Master Rubber Worker. Members of the engineering flying squadron are offered a three-year course in which to qualify for the degree of Graduate Rubber Mechanic.

(The Goodyear Tire & Rubber Co.)

GOODYEAR INDUSTRIAL UNIVERSITY IS FUNDAMENTALLY AN INDUSTRIAL INSTITUTION, TEACHING SUCH BRANCHES OF ACADEMIC AND SCIENTIFIC WORK AS ARE NECESSARY TO THE DEVELOPMENT OF AMERICAN INDUSTRY.

SPECIAL APPRENTICE CLASSES.

There are special apprentice classes for beginners in factory work where skilled labor is essential. The apprentice machinists' course is for three years, also that for an apprentice draftsman. The former courses are so conducted that young boys may enter the factory and receive a remunerative wage while they are learning. They devote 36 hours a week to shop work and 10 hours to classes, receiving pay for the full 46 hours. Every six months a nominal increase is granted, the amount depending upon each apprentice's ability to grasp details and advance in his machine work. At the end of the three-year course, he is an expert machinist and is eligible for another three-year course in which he can be trained as a foreman or factory mechanical executive.

The special vocational course for foremen and factory executives covers a year of study and class work, while there is also offered an 18 months' course for inspectors. There are at present 1,000 inspectors taking this course and over 2,500 taking the production school course, while 350 shift foremen are specializing in study to fit them for higher executive positions. Stenographic and typist courses are offered also for girls, in addition to those in the school of household arts, including classes in domestic science, housekeeping and sewing.

SPECIAL COURSES FOR MUTES.

One of the interesting courses will be that for instruction in the mute language. Over 700 deaf or silent men and women are employed in factory and office work. They have their own community activities, but are thrown into such constant contact with those not deprived of speech and hearing, that many of the latter desire to learn the silent language in order to converse with them without resorting to the pad and pencil. This course will be for speaking persons. There are also special courses for the mute men and women. The most popular among these for men is the mechanical drawing class. There are, all told, over 300 mutes enrolled in special classes designed for their benefit.

THE DREAM OF VICE-PRESIDENT LITCHFIELD REALIZED.

Perhaps no one man is more directly responsible for the establishment of the university than Paul W. Litchfield, vice-president and factory manager. He long has been the mainspring of all recreational and educational activities, and Goodyear Hall, his dream of several years ago, has finally materialized. Mr. Litchfield is chairman of the Goodyear Board of Education, having direct charge of the university's affairs. Harry Blythe, who is manager of Goodyear Hall and the head of the university, is 30 years of age and a graduate of Mt. Union College, Alliance, Ohio. A. C. Horrocks is head of the factory school, while Coach Ed Connor is head of physical education. Other members of the faculty are: Dr. John A. Custer, who for many years occupied the Chair of History at Lawrence College, Appleton, Wisconsin, and Professor W. A. Emery, formerly of Carnegie Institute of Technology at Pittsburgh. Special language instructors also have been engaged for classes in Spanish, Portuguese, and other languages.

GOODYEAR HALL AFFORDS COMPLETE UNIVERSITY ACCOMMODATIONS.

Goodyear Hall, which contains complete university accommodations, including faculty office suites, 65 large class rooms, lecture and assembly rooms, and several fully equipped laboratories, is complete as to facilities and equipment for mental and physical development, and recreation of the employees.

The auditorium is of the acoustic shell style of architecture, and will seat 1,686 people. The French Renaissance scheme of interior decoration is used throughout, with an indirect lighting system. Two mural paintings adorn the side walls: one of the Bay of Naples with Mt. Vesuvius in the distance, the other a South American scene, picturing natives in the Amazon region loading rubber for export. There are rest rooms for women, smoking rooms for men, and check rooms.

The stage has double aperture, serving, either separately or simultaneously, the auditorium or the gymnasium. It is forty feet wide and thirty-three feet deep with floor laid in sections to permit its removal for installation of swimming tanks, ice skating rinks or other amusements for extraordinary acts. A complete counter-weighting system is employed for shifting scenery for either the auditorium or the gymnasium. The gymnasium with balcony and main floor has a seating capacity of more than 5,000. The floor is of sufficient size to permit five games of basketball to be played simultaneously. Below the gymnasium are 5,500 locker rooms for men and 54 individual shower baths. For women there are 200 lockers and 18 shower baths in addition to community and lounge rooms and dormitories.

On the third floor of Goodyear Hall are legislative chambers for the industrial legislators of the Goodyear Industrial Republic House and Senate. They are patterned closely after the Senate and House Chambers at Washington in respect to floor arrangement, with spectators' galleries, anterooms and private offices.

The cafeteria on the sixth floor is capable of accommodating 4,000 people an hour and is the largest in Akron and one of the largest in Ohio. Beside the three main entrances to Goodyear Hall, entrance can also be gained through a tunnel leading from the factory building, thus enabling employees to enter the building and avoid inclement weather and street traffic.

As for the university itself, its establishment has been conducive to more harmonious relationship between capital and labor in Akron. The university constitutes a unique experiment and one which is being watched by the entire world. It is proving remarkably successful so far, as indicated by the large enrollment, and should be copied extensively by other industrial concerns in America. Its enrollment is steadily mounting and has increased from 4,000 originally to nearly 6,000, while officials of the university state that they expect an enrollment of nearly 8,000 by July first.

INSPECTED SPARE TIRE LOCKS.

The Underwriters' Laboratories, 207 East Ohio street, Chicago, Illinois, and its branches, maintain a system of inspection at factories and labeling of products which have been examined and tested by the laboratory staff. A list of recently inspected spare tire locks follows:

Underwriters' Label.

"ABLE." Able Manufacturing Co., San Francisco, California. Two types: one type consisting of steel loop secured by combination lock, another type consisting of case-hardened steel chain secured by combination lock. Locks spare tire to rear springs or to frame in such a manner that tire and spring or frame are both encircled by device which is held together with a combination lock. Loop or chain is secured to spring or frame to prevent rattling or loss when not in use. Designed for use on all types of automobiles in which it is possible to loop device around frame or spring.

"BULL DOG." The Automatic Equipment Co., submitor, St. Louis, Missouri. Ordinance Tool Manufacturing Co., manufacturers, St. Louis, Missouri. Spare tire lock for use on all automobiles equipped with a tire carrier of the internal rim type, and in which tire carrier is not readily removable.

"UNIVERSAL." Johnson Automobile Lock Co., Chicago, Illinois. For use on all types of automobiles in which tire carrier is not readily removable.

THE BEST THING THAT CAN BE GIVEN TO THE OWNER OF A Liberty Bond is this: Hold the bond you bought during the war; it is as safe and sound as the United States Government itself. Buy as many more at the present low rate as you can afford.

Practical Tire Repairing.

By L. R. Zeebich.

THE FOLLOWING DESCRIBE METHODS of repairing fabric and cord tires are taken from the practical experience of an expert tire repairman. The instructions for cutting and building as here given will produce the longest tire service if followed. This system saves material because of the fact that a large section of fabric and rubber around the point of injury is not removed. The injury is repaired without removing a great deal of the original material and the new materials are firmly locked in place.

GENERAL INFORMATION.

- (1.) Never attempt sectional repairs on tires with tread or fabric loose in many places.
- (2.) Be sure of your decision as to the kind of repair to be made before starting to work.
- (3.) Determine the length of the injury and the dead fabric if any.
- (4.) All tires must be thoroughly dry for good work.
- (5.) All dirt and dead material must be removed.
- (6.) Aim to eliminate the injury and possibility of friction in the repair.

(7.) It is not necessary to cut away large portions of the tread or step down several plies of fabric to secure a satisfactory repair. Experience teaches that this is not good practice. In stepping down the original fabric the carcass is weakened. It is then necessary to replace the removed fabric with new material. Take the stretch out of the fabric. This requires the skill of a practiced workman, and unless it is carefully done the repair will bulge. When tires are built the fabric is stretched over the core by machinery; therefore, it would be difficult to exercise sufficient strength by hand to take the stretch out of the fabric. New fabric takes longer to cure and a great many repairs leave the shop undercured, causing separation, bulging, and finally a defective repair.

(8.) Skive down the fabric around the hole. This overcomes friction and what is termed a hinge in the repair.

(9.) Round all breaks at the end to stop further breaking.

(10.) Sectional repairs that fall down are usually due to the following:

- (a) Not slitting the fabric back far enough.
- (b) Lack of thorough cure.
- (c) Hinges at the point of injury caused by neglected skiving.
- (d) Lack of air-bag pressure.
- (e) Dirty stock.
- (f) Insufficient cement or allowing it to become too dry.

BUFFING.

Always buff inside and outside of the repair, removing all dirt and dead material, and carry the buffing over the repair slightly to roughen the job so that the cement will adhere easily. If the buffer does not reach all points use a scraper or knife after softening with gasoline.

FIG. 1. A BLOW-OUT REPAIR.

CEMENTING.

All repairs must be dry before cementing. Three coats are applied, allowing each to dry fully, the time required depending upon weather conditions. Brush the cement over the repair slightly to allow for trimming. Always run or inject cement between loose plies of fabric and hang the tire in a position that will allow the excess cement to drain. Do not use home-made cement in making sectional repairs. Use only first-class material. Cemented tires should not be placed in a draft as the cement will

crust over and remain damp underneath. Cement can be dried too long and lose adhesiveness. Stir the cement thoroughly before using.

If you accumulate cushion gum and fabric scrap, cement can be made by mixing one pound of cushion gum with one gallon of high test gasoline. Add 1 ounce of wood alcohol for cutting. The mixture should be well stirred. The use of home-made cement should be confined to cementing or curing boots and inner liners into tires.

BUILDING.

Building stocks should be hung on the wall in a fairly dry place and protected from dust, soapstone, etc. Cut all fabric on the bias and trim the selvages. Lap the fabric when connecting. Have the cement dry before working on the casing.

Remove soapstone or oil on the gum by washing with high test gasoline. Do not be alarmed if the repair stock is bloomed, this is merely the free sulphur working to the surface. Remove the bloom with high test gasoline. Handle repair stock with clean hands. Stretch all fabric when applying to the job. Roll and stitch the repair thoroughly before trimming. Perforate all repairs with air vents before curing. Do not use a spliced ply of fabric directly over the injury or over the bead. Trim all edges and splices down before curing. Always fill holes with cushion gum. It is advisable to use a ply of 1/32-inch cushion gum between the band ply and the reclaimed shoe. Endeavor to keep unevenness out of the repair as it usually hinges and breaks. If the gum sticks to the holland liner, wet the opposite side with gasoline.

REPAIRING A SMALL BLOW-OUT.

Any repairman or individual contemplating going into the tire repair business can make successful repairs by following these directions and by a little common sense. The following instructions are for repairing an ordinary blow-out when the injury does not extend over 3 inches in length:

(1.) Place the tire on a building mandrel, and cut away all loose and uneven particles of rubber, starting and slanting the cut 45 degrees to give more uniting surface. Cut through the breaker.

(2.) Skive down two or three plies of fabric at the point of injury. This depends upon the size and number of plies of fabric in the tire.

(3.) Buff the outside of the repair. Extend the buffing slightly over the repair and roughen the tread edges so that the cement will adhere.

The above instructions can be easily followed by referring to Fig. 1.

(4.) The next step is to turn the tire. If it is a soft bead clincher it can be turned by the workman over his knee. If it has cable base beads use a tire spreader.

(5.) While the tire is in this turned position, buff the inside of the repair from 6 to 10 inches from the center of the injury. This will depend upon the length of the injury and length of reclaimed fabric shoe to be used.

(6.) Cut the inside or band ply of fabric diagonally as indicated by dotted lines in Figure 2. The length of the cut will depend upon the extent of the injury, advisedly 2 inches beyond the end of the injury and not more than 3 inches. This opera-

FIG. 2. CUT INSIDE FABRIC PLY DIAGONALLY.

tion should be accomplished with a small hook or notched knife.

(7.) Pry the fabric loose with a blunt screw-driver or prodding tool, laying the four wings or ends back as indicated in Fig. 3.

(8.) If the injury is fresh and the fabric clean and sound no further buffing is required as the cement will adhere to the clean cured friction between the plys. Further buffing is necessary only when the fabric has been water logged or is dirty. If the inner plys are water logged, rotted, or exceptionally dirty, one or more plys can be removed, but must be replaced as described in operation 14. Always aim to preserve the inside or band ply as this is the locking ply and holds the repair together.

(9.) Repeat operation 2. Skive down to one ply of fabric in order to remove the stiff joint or hinge.

CEMENTING.

(10.) Three coats are applied, allowing each coat to dry thoroughly. The time required depends upon weather conditions. Cemented tires should not be placed in a draft as the cement will crust over and remain damp underneath. Cement should not be allowed to dry too long or it will lose its adhesiveness. Hang the tire in a clean, dry place, the repaired section on top so that all excess cement can drain.

(11.) Select the proper size reclaimed fabric 3-ply shoe. Cement this at the same time and place with the tire to dry.

BUILDING.

(12.) Place the tire in a building rack or stand and spread the beads apart with bead spreaders. Bring the edges of the injured portion together. The cement being tacky, these edges will immediately unite. Cut a small strip of cushion gum and stitch it in the crevice caused by skiving the edges of the injury. Then fit a new piece of building fabric in the section, taking care to make a good fit. This can be easily accomplished by making a pattern or templet of holland liner as it will not stick to the freshly cemented fabric. After the correct size has been determined, cut a piece of building fabric the exact size of the pattern and stitch this into place, trimming any excess fabric with a hook or notched knife.

(13.) Close up the injury and lock the new fabric in place by bringing the tips of the four wings back to their original position. Stitch them down carefully, starting at the outside and working toward the center. Now cover the edges with strips of cushion gum as indicated by dotted lines in Figure 2.

(14.) If one or more plys have been removed as indicated in operation 8, replace them with a new ply of fabric. This ply should extend at least 1 inch beyond the extreme outside of the dotted lines in Fig. 2. In the event that it is not necessary to remove a ply, lay the 3-ply reclaimed skived shoe in place, centering it well and stitching it down thoroughly from the center out. Dust the inside with soapstone and remove the bead spreaders.

(15.) Place the tire on the building mandrel.

(16.) Roll down the edges of the injured portion of the tire which have been previously been brought together in operation 12.

(17.) Fill in all low spots and crevices caused by skiving, with cushion gum, stitching thoroughly.

(18.) Cover the cemented section with a layer of 1/32-inch cushion gum.

(19.) Fill in the portion cut away with tread stock, and stitch thoroughly, perforating the new gum with a pricking awl or porcupine roller.

(20.) Trim down the new gum flush with the tire.

(21.) It is advisable and will result in neater work if the repaired section is buffed lightly with a wire brush or emery wheel. The new gum should be buffed from the center out. Care should be taken not to exercise too much pressure.

(22.) Cure.

REPAIRING A LARGE BLOW-OUT.

When the injury extends over three inches in length, it is usually necessary to lay back the tread.

(1.) Be sure of your decision as to the kind of repair to be made before starting the work.

(2.) Locate the injury and cut away all loose particles of tread. Some repairmen start their splice in the center of the repair and lay back the tread both ways. This method is optional, although the writer believes the single lay-back is more practical as it leaves one end free to work over, and also carries the splice away from the hole as this is filled up with gum and is, therefore, yielding, giving movement to the splice with a tendency to loosen up. Where the break is across the tread completely, make a double lay-back.

(3.) When you have located the place for the splice, cut across the tire, slanting the cut 45 degrees to give more uniting surface. Cut through the breaker.

(4.) On non-skid tires, cut the splice on the highest point as this will give better pressure in the mold when cured.

(5.) Cut under the sides of the tread on both sides with a large notch knife, to the first ply of fabric, one to three inches beyond the end of the break, then peel the tread back, cutting it away from the carcass with a tread knife as you go.

(6.) Strip the side walls down about one inch from the end of the lay-back on both sides and remove or lay back the side walls if in good condition. Figure 4 illustrates the side walls laid back.

(7.) In most cases the bead cover is about one inch above the bead, which is cut over the bead with a hooked nose knife, and removed. Should the tire not have a bead cover, trim the side wall off and treat it as though it was there. The new ply of fabric takes the position of the bead cover when removed.

(8.) Repeat operation 2 under "Repairing a Small Blow-Out."

(9.) Now buff the outside of the tire including the bead, as previously described. The lay-back tread or side wall can be held out of the way by tying them back, or by a series of fish hooks. If fish hooks are used, grind off the barb and attach the pair together at the ends.

(10.) Refer to operation 6 under "Repairing a Small Blow-Out." Instead of cutting the band ply, cut diagonally across the outside ply of fabric. If the injury is of long duration, the outside ply may be rotten. In that event, remove it altogether and perform operation 6 on the second ply.

(11.) Repeat operations 4, 5, 6, 7, 8, and 9 under "Repairing a Small Blow-Out."

BUILDING.

12. Repeat operations 12, 13, 14, 15, 16 and 17 under "Repairing a Small Blow-Out."

In repeating operation 12, if one ply of fabric has been removed, it is advisable to replace this with a new ply placed over the whole repair, ending at the toe of the bead, and extending at least one inch beyond the ends of the diagonal cut shown in Fig. 2.

(13.) Cut a ply of 1/32-inch cushion gum long enough to build up on the lay-back and come down to the heel of the bead.

FIG. 4. LAY BACK SIDE WALLS.

FIG. 3. LAY FOUR ENDS BACK.

Stretch and roll the cushion gum thoroughly.

(14.) Cut two strips of side wall gum to match color when cured, and apply on the side of the side wall, starting just over the bead, bringing it out about the tread line and trim smooth.

(15.) Now wash the whole surface where the tread comes down with high-test gasoline to remove dirt, etc.

(16.) Back up the hole in the tread with cushion gum and pull the tread down to fit snugly in place. Be sure to have a strip of cushion between the splice.

(17.) Fill in the hole in the tread, also around the splice and where the tread meets the side wall.

(18.) Stitch, roll and perforate the whole repair well for air vents and trim down smooth. All lay-back sections should be run through a bench tread roller which thoroughly unites the fabric and rubber.

(19.) Cure.

REPAIRING A RIM CUT.

Referring to Figs. 4 and 5, a side section or rim cut repair differs in a lay-back section in that only one side wall is removed and the tread is laid back only when the injury extends four or more inches in total length.

Do not repair a rim cut unless it is an accident. Avoid repairing a tire run under-inflated for the chances are it is weak in other places and will soon blow out at some other point beyond repair. Rim cuts caused by obstacles, curbs, defective rims, etc., can be successfully repaired.

(1.) Locate the injury.

(2.) Remove or lay back the side wall two or three inches beyond the end of the injury. If it is at the heel of the bead, it is not necessary to disturb the tread in most cases. If the injury is above the heel, a portion should be removed as indicated in Fig. 4, or laid back as previously described. In any event, cut away the side wall or tread on a 45-degree angle to allow more surface for uniting again.

(3.) Remove bead strips.

(4.) Skive edges of injury.

(5.) Buff removed portion, carrying the buffing well over the repair and bead.

(6.) The next step is very important, and that is locking the repair in place.

(7.) Cut the fabric horizontally along the heel of the bead about one inch beyond the injury, then slit the fabric on about a 60-degree angle toward the tread at either end of the injury. See heavy line in Fig. 4.

(8.) Pry the fabric loose and turn it back as indicated in Fig. 4.

(9.) The cutting down from the outside being completed, now turn and buff the tire as previously described. Skive the injury, lift the band ply in the same manner as in operation 7. Now refer to and note operation 8. Cement, select skive shoe, etc.

(10.) Close up the injury with cushion stock as described in operation 8.

(11.) Make a pattern of holland cloth that will extend from under the laid-back inside ply to the laid-back outside ply of fabric. When the pattern has been properly fitted, cut the fabric according to the pattern and stitch in place, being careful to stretch the fabric to avoid a bulge after the tire is put in service. Start building up on the inside and be sure the new fabric is as wide as the widest part of the lay-back.

(12.) Stitch down the fabric lay-back or wing.

(13.) Insert a three-ply reclaimed shoe, making sure three plies come flush with the toe of the bead.

(14.) Trim off the portion of the shoe extending over the toe of the bead.

(15.) Finish building up the side wall as heretofore described in detail.

CURING SCALE.

The following scale shows the steam pressure and equivalent degrees in F.

Steam Pressure. Pounds.	Degrees F.	Steam Pressure. Pounds.	Degrees F.
35.....	280.6	55.....	302.6
40.....	286.7	60.....	307.3
45.....	292.4	65.....	311.8
50.....	298.7		

The time of cure will fluctuate by difference in heat. Aim to work at 50 to 55 pounds pressure.

The above is approximately correct when circulation is entirely open, and represents degrees F. of the steam line, and not at the mold.

The time of cure of the different repairs is in many cases optional with the repair steam man, due to the many makes of vulcanizing plants on the markets and also to the kinds of materials used. It is always advisable for the steam man to take test cuts and arrive at curing scales for himself. In fact this is simple, as the different jobs as they come out can be tested with a pencil point and if the impression remains and does not come back to place, a slight amount more of curing will remedy it. Should it be hard or brittle, decrease the cure.

CURING SCALE FOR FABRIC AND CORD FABRIC SECTIONAL REPAIRS.

The following scales have been developed at a large plant using controlled steam at 50 to 55 pounds pressure on standard equipment and can be safely used with the best of results, in any plant with this amount of steam, a slight variation being made to suit the plant in use.

Size. Inches.	Cord		Size. Inches.	Cord	
	Fabric. Minutes.	Fabric. Minutes.		Fabric. Minutes.	Fabric. Minutes.
3.....	45	50	4½.....	60	70
3½.....	50	60	5.....	60	70
4.....	55	65	5½.....	65	75

When using an impression pad add 10 to 15 minutes. Cure a fabric tire on the arm about one hour; cord tire, one hour and fifteen minutes.

Cure gray tubes for hole repairs 15 to 20 minutes at 50 pounds. Cure red tubes slightly less than gray tubes. Splices and valve pads take about the same time.

HANDLING HOT CEMENT CLINKER BY RUBBER CONVEYOR BELTING.

An unusual problem in handling hot cement clinkers with a temperature of 200 degrees and over was recently solved at the plant of the Standard Portland Cement Co., Leeds, Alabama, by using a rubber conveyor belt. The clinker, however, could not be cooled sufficiently to prevent scorching of the belt and its rapid destruction. The answer was found by running the belt at an incline of 12 degrees, so that the lower pulley dipped into a trough of water, thus carrying a film of cold water upon the belt, on which the hot clinker from the loading hopper was deposited.

The conveyor was made endless by the use of metal belt fasteners which brought the belt ends tightly together, preventing the clinker ash from getting into the joint and abrading the belt ends. Moreover, in this method of joining no metal came in contact with the pulleys to cause wear and a permanent joint was thus assured.

In six months of operation, this conveyor carried 61,000 tons of clinker and credited saving in belt cost alone to this conveyor is \$300. The belt used was made particularly to withstand temperatures to 200 degrees. ("Chemical and Metallurgical Engineering," March 24, 1920.)

Interesting Letters from Our Readers.

FURTHER STUDY FOR NATIVE RUBBER PLANTS.

TO THE EDITOR:

DEAR SIR: The finding of approximately 300,000,000 pounds of rubber in native American plants does not remove the need of further studies, since some of this supply is unavailable except at great expense and the total would not suffice in a long-drawn-out war.

The possibility of bringing the plants into cultivation on a commercial scale even in times of peace should, it seems to me, be further investigated. Such investigations should include the search for better varieties or strains of *Chrysanthamnus nauscosus* than we have yet found. Only 12 of the 22 named varieties have been examined. Breeding and selection should also be begun, starting with the best available sorts. Also experiments in changing the cultural conditions in order to increase the deposition of rubber. The pruning experiments, to increase the weight of the rubber-bearing portions and possibly the percentage content are not being continued this year because of the difficulty of getting out to the tract at Benton. This is a promising line of attack.

My interests in the matter are just two, namely, the desire to see the results of our scientific work turned to some practical account, and second, the much broader desire to see our country protected from a possible shortage in this important commodity in time of war. For these reasons I wish that *Chrysanthamnus* might soon be given the same attention that has been accorded to guayule or, better yet, that a thorough-going investigation be made of all possibilities in the nature of rubber plants suitable for cultivation in America, including guayule, *Chrysanthamnus*, *Haplopappus*, a long list of exotics, and certain native latex plants which we now have under examination and some of which are exceedingly promising.

Several of our leading government botanists and plant breeders are much interested in these matters and are very encouraging as to the possibilities of *Chrysanthamnus* culture, but they can do nothing on an extensive scale unless there is a general public demand for it. Our American people as a whole are very slow to protect themselves against remote dangers, and since our government workers can get support only when there is some political interest to be served, it remains, it seems to me, for some man or group of men with long vision and strong patriotic impulses to take the initiative in the matter.

Any suggestions which you may care to make or any criticism of our work will be most thankfully received, even though our active studies in *Chrysanthamnus* have ceased, at least for a time. We always appreciate the opinions of those who are familiar with the more practical aspects of the situation.

H. M. HALL.

Berkeley, California, May, 1920.

STEVENS' SULPHUR DETERMINATION METHOD.

TO THE EDITOR:

DEAR SIR:—In your issue of March 1, you reprint a paper by Messrs. Kratz, Flower and Coolidge entitled, "A Rapid Method for the Determination of Sulphur in Rubber Mixtures." These authors have been good enough to refer to the method in use in my laboratory for this purpose (see "Analyst," Vol. XLIII, 1918, page 377). I do not lay claim to originality in the use of magnesium nitrate in the place of the ordinary sodium carbonate-potassium nitrate mixture, as magnesium nitrate was recommended some years ago for this purpose (see, for instance, Caspari, "India Rubber, Laboratory Practice"), although its advantages do not appear to have been fully recognized. The only modification I lay claim to is the use of a Kjeldahl flask

for the wet oxidation. By fitting this with a single surface condenser in the neck, the contents of the flask may be boiled for some hours without appreciable loss of acid. I do not think the process of transferring the contents to a dish for evaporation and "baking" is an operation likely to involve much trouble or loss, and my process has the advantage of avoiding the use of bromine. This is of importance, because bromine is frequently contaminated with sulphur compounds, whereas the ingredients I use, namely, nitric acid, potassium chlorate and magnesium nitrate, are all obtainable free from sulphur compounds, so that blanks give practically negative results. For those who may not have a copy of "The Analyst" handy I give below an account of the method I employ for carrying out the determination.

About 0.5-gram of the sample is digested with 20 cubic centimeters of nitric acid (specific gravity 1.42), to which about 0.5-gram of potassium chlorate is added. If the sample is finely divided, the initial reaction is violent, and the flask (a Kjeldahl flask is suitable) should be cooled in water. The flask is fitted with a small surface condenser, and the liquid boiled for two or three hours, then evaporated to dryness in a basin, with the addition of 3 grams of pure magnesium nitrate. The heat must be moderated at the last stages to avoid spitting, and finally it is cautiously heated over a naked flame. The slow combustion which takes place owing to the presence of the magnesium salt is quite under control. There is no need to carry the heating farther, and ten or twenty operations can be carried out with the same dish. If an appreciable amount of unburnt carbon remains, it is best destroyed by digesting the nitric acid and a little chlorate, and the excess of acid removed by evaporation. Ten cubic centimeters of concentrated hydrochloric acid are then added, and the dish covered with a clock-glass, and gently heated for an hour or two until red fumes cease to be given off. The liquid is then diluted, filtered, and made up to 300 cubic centimeters, heated to boiling on a hot plate, and precipitated by very gradually adding 5 cubic centimeters of a 10 per cent solution of barium chloride. The whole is allowed to stand over night, and the barium sulphate estimated on the following day in the usual manner.

Numerous duplicate analyses give concordant results, and also agree with estimations made by heating the sample with nitric acid in a sealed tube.

One assistant can easily average 6 sulphur determinations a day by this method.

HENRY P. STEVENS.

15 Borough High Street, London Bridge, S. E. 1.

THE RUBBER SITUATION IN THE PHILIPPINES.

TO THE EDITOR:

DEAR SIR: Many years in the Philippines and a knowledge of the situation there prompts me to summarize the conditions affecting rubber planting.

(A) There are certain tropical agricultural commodities or industries that cannot be developed by a poor man (all Filipinos) without lots of capital, because of the many years' wait for any returns. Chief among these is rubber where cash crops are not practical as in cocoanut production.

(B) The present land and labor laws were formulated by Americans, not by the Filipinos, and cannot be changed without Filipino legislative action approved by the President of the United States. All Filipino action has been consistently blocked by our State Department.

(C) Progressive Filipino planters realized these initial law handicaps years ago, and it is a matter of record that in 1917

the Filipino Agricultural Congress—a semi-official body—came out squarely for a change in the existing immigration laws to permit entrance of labor from outside, but the American power then in control did not help them.

(D) The government changes since the Jones Law went into effect are many:

- (1) Philippine Assembly equals our Congress.
Philippine Senate equals our Senate.
Philippine Cabinet equals our Cabinet.
Philippine Council of State equals our Cabinet plus Speakers of both houses with the President presiding.
- (2) National budget covering all appropriations based on the English system.
- (3) Municipal and government ownership which is efficient and yields profits instead of adding taxes to the people.
- (4) A national development company (\$25,000,000 capitalization) with 51 per cent of stock government, and 49 per cent public, administered by business men, to develop the latent resources of the Islands by subsidiary companies.
- (5) They have a Philippine commercial agency in the States with offices now in San Francisco and New York. I understand J. J. Rafferty has just been named Philippine Trade Commissioner for the United States. (It is on this that you can make a bit that should count—that unless the Philippine officials can change their laws to permit rubber development on a business basis [large leased land areas and cheaper and plentiful imported labor]—they had better stop trying to interest rubber investment altogether. This may get action.)

(E) The patriotism of the Filipino people in organizing a division for use at the front, their efficient government organization from a practical operating view-point, their foresighted public works development, their appreciation of the work done by Americans in giving a gratuity (above all contractual obligations) to Americans who have served faithfully and well, are the creditable things that may be referred to—the sugar for the beginning and the ending of your article.

Faithfully,

Manila, P. I., 1920.

C. F. H.

OF PIONEER STOCK.

TO THE EDITOR:

DEAR SIR: To introduce my sister and myself, allow me to mention that our father, L. Otto P. Meyer, a naturalized American, was well known in the rubber world. In former years you sometimes bought short articles about his inventions, as in No. 5 of your paper of the year 1894, February 15, page 133.

Our father died at the age of 88 years. Although his patents, the employment of tin-foil and tin molds, as also the improved process of the water-hardening, afforded the American manufacturer the only effective protection for 21 years, and even today form the basis for the manufacture of vulcanite, he died in very poor circumstances, leaving a widow in delicate health, who also died a few years ago, and we, his two maiden daughters, both artists (lady painters). Our father told us shortly before his death, "If ever in life you should need the help of a friend, I am sure that among my American rubber friends there will be some one who will aid you." I am not aware of any of my father's friends or acquaintances are still alive; I therefore address these lines to you.

We are both born Americans, painters by vocation, and, although we have lived here many years, we are generally treated by the Germans as foreigners, which makes it more difficult for

us to earn money. We therefore would be happy if we could sell some pictures in America. We have at hand originals and good copies of the Dresden Gallery. As the German money stands very low, it would be for American purchasers a good bargain.

Please excuse my troubling you, but the terrible times we have gone through have induced us to apply across the ocean for help and we would be very happy if we could receive an order from you.

Yours respectfully,

Ostbahn Strasse, 8, III,
Dresden, April 4 1920.

EDA MEYER.

WHY NOT AMERICAN RUBBER FACTORIES IN MALAYSIA?

TO THE EDITOR:

DEAR SIR:—With America importing thousands of tons of rubber a year—one company alone is using 35,000 tons—it would seem worth while for more American rubber manufacturers to build plants in eastern countries. The principal sources of supply are Singapore and Malaysia and in order to furnish the needs of the United States, vast industries have grown up in these countries. What was formerly a mere jungle is to-day a busy center of industry. The distance between the source of supply and the American manufacturer is so great that much time and money is lost in the process of transportation. Cheap coolie labor in China is another factor which would enable the American manufacturer to turn out rubber goods at a much lower price were the rubber grown on American plantations in the Orient.

Representatives of the Interchurch World Movement who are making an economic survey of the East report that native Chinese are making fortunes in Malaysia, through the demand of the United States for the raw material. Sons of coolies, who went to the Straits a generation ago to work on the plantations are to-day owners of rich holdings and the chief business men of the place. The English Government offered five acres each to coolies who would agree to cultivate the jungles. In consequent great centers of civilization have sprung up where formerly only wild animals were to be found. The rubber plantation yields a big profit for the energy expended upon it.

INTERCHURCH WORLD MOVEMENT OF NORTH AMERICA,
45 West 18th street, New York City.

AS TO RUBBER HEEL PATENTS.

TO THE EDITOR:

DEAR SIR: Are there any patents covering the use of a concave surface for the portion of a rubber heel that attaches to the shoe? If so, will you be good enough to cite them for me?

Los Angeles, March 10, 1920.

P. A. McAVINY.

Heel patents in general run into thousands. To scan them all would be something of a task. Of course there are the Trufford patents that are suggested by your question. Then, too, as far back as 1897 the idea of recessed heels was indulged. Witness the pneumatic heel brought out by Anderson of Boston. There was also the Spider-grip heel, made with a rand so it could be attached directly to the heel-seal by a heeling machine. There was, furthermore, the Ferguson heel that, to quote the printed description, had "a sort of hollow or air-chamber next to the shoe which causes the rubber heel to adhere to the leather, on the same principle of suction which enables a fly to keep its footing on a ceiling or wall."

You might look up the following also:

1896. Anderson	No. 582,336	1909. Herbst	No. 658,441
1897. Warner	594,106	1902. Hilton	736,894
1897. Hanline	615,167	1904. Hammer	817,355
1898. Morrow	623,803	1906. Kearney	866,867
1899. Norris	630,726	1906. Anderson	867,764
1899. Ferguson	638,228	1907. Leighton	906,807

There are many others, as this is by no means an attempt at a complete list.

THE EDITOR.

What the Rubber Chemists Are Doing.

CARBON BLACK.¹ METHOD OF MANUFACTURE.

CARBON BLACK, as known to the American trade, is the fluffy, velvety black pigment produced by burning natural gas with a smoky flame against a metal surface. It is entirely different in physical characteristics from lampblack, which is made by burning oil or other carbonaceous material with insufficient air for complete combustion and collecting the smoke in settling chambers. Lampblack is gray in contrast to the deep black of carbon black, and often contains considerable quantities of empyreumatic matter.

The process of manufacture used to the greatest extent at the present time is the so-called channel system, in which the black is deposited on the smooth under-surface of steel channels by lava-tip burners set at a distance of three or four inches below the channel. The channel irons are usually built up in tables of eight, sometimes 100 feet long, and are given a slow reciprocating motion which scrapes the black deposited on them into hoppers from which it is carried by screw conveyors to the packing house, where it is bolted and sacked. The mechanism is enclosed in sheet-iron buildings in order that the amount of air may be regulated. Varying the amount of air, speed of scraping, and pressure of the gas controls the quality of the product. The shape of the burner and distance from the collecting surface also affects the quality of the black, but these are constant for any one plant. Other similar processes differ only in the nature of the collecting surface and burners.

THEORY OF FORMATION OF CARBON BLACK.

When natural gas burns in an incomplete supply of air, the carbon is liberated, not as a result of preferential combustion of hydrogen, but as a direct decomposition of unburned gas in the heat of the flame. According to Bone² and co-workers, combustion takes place in steps as a result of hydroxylation:

It is evident that the tendency is always to run from A to C. When the proportion of methane to oxygen is $\text{CH}_4 : \text{O}_2$ the reaction goes from A to B to C to C'. If the ratio is $2\text{CH}_4 : \text{O}_2$ or higher, only a part of the methane can be oxidized through the reaction A to C and part is decomposed at A by the heat evolved in the A to C reaction. The lowest per cent of oxygen in which a methane flame will burn is 15.6 per cent. Carbon will be evolved only in the inner part of the flame, where the oxygen supply is low but where there is sufficient heat to break up the methane, and the per cent of carbon to be expected by the incomplete combustion of methane is low. Gases rich in ethane and the higher homologs produce greater yields by this process.

The function of the cold surface is to cool the liberated carbon in the flame sufficiently to prevent its combustion. This

permits the use of a sufficiently hot flame to give carbon uncontaminated with hydrocarbons or their partial oxidation products and produces a finely divided material which has been prevented from agglomerating by the sudden cooling. It is evident that there must be an optimum temperature and an optimum position for the surface in the flame. Too cold a surface may prevent the maximum separation of carbon; too hot a surface will allow too much carbon to be burned and may change the properties of the carbon which remains unburned. The temperature of the channels in the present processes is about 300 degrees C.

USES OF CARBON BLACK.

In order of importance the uses of carbon black are as follows:

- 1—Printers' ink.
- 2—Automobile tires and other rubber goods.
- 3—Black and gray paint and enamel.
- 4—Stove polish.
- 5—Other products—such as phonograph records, carbon paper, crayons, typewriter ribbons, black and gray paper, glazed paper, tarpaulins, black leather, bookbinders' board, marking and stenciling inks, rubber sheeting and clothing, hard rubber, artificial stone and black tile, Chinese and India inks, fireworks, insulating materials, crucible steel, case hardening.

The amounts used by these industries in 1918 were approximately as follows:

	Pounds.
Printers' ink	10,000,000-12,000,000
Rubber goods	20,000,000-
Stove polish	4,000,000- 5,000,000
All others	1,000,000-

Besides this, in normal times probably 15,000,000 pounds are exported.

RUBBER TIRES.

Prior to 1914 little carbon black was used by the rubber industry and then only in small amounts as a coloring material. Little distinction was made between carbon black and lampblack, the two compounds being used indiscriminately. At this time, due partly to the stimulus afforded by the rising price of zinc oxide, it was found that carbon black could be used in very large amounts as a filler for rubber, with a correspondingly smaller amount of zinc oxide. Carbon black is used in rubber in quantities of 3 per cent to 20 per cent by weight. Many manufacturers claim very unusual properties for rubber so compounded. It is said to increase the tensile strength very greatly and to give increased toughness and resistance to abrasion. It is believed by some authorities that the life of the rubber is increased. Other rubber chemists are more conservative in their praises of carbon black and do not admit that it possesses any properties which make it irreplaceable.

From the point of view of cost, carbon black is much cheaper than zinc oxide. Carbon black, absolute specific gravity 1.8, suitable for compounding in rubber, can be procured for as low as 10 cents a pound at the present time. Zinc oxide costs at least as much and has a specific gravity of 5.8. Carbon black evidently costs one-third as much as zinc oxide on a volume basis, supposing that equal volumes were compounded with the rubber, but in practice a greater volume of carbon black is used than of zinc oxide so that the resulting mix with carbon black contains less rubber per unit volume than the corresponding zinc oxide mix.

From a theoretical consideration, carbon black should be an ideal filler for rubber on account of its extremely fine state of division and the correspondingly large surface energy developed when intimately mixed with the rubber. It also serves to

¹"Carbon Black, Its Properties and Uses." By G. St. J. Perrott and Reinhardt Thies, *Chemical Research Laboratory, Bureau of Mines*, Pittsburgh, Pennsylvania. Presented at the meeting of the American Chemical Society, Philadelphia, Pennsylvania, September 2 to 6, 1919. Published by courtesy of the American Chemical Society.

²Transactions of the Royal Society, London, 215 (1915), 275.

protect the rubber substance from the effects of light and may possibly retard oxidation.

Whatever may be the true state of affairs as to the irreplaceability of carbon black in rubber, an enormous amount is now consumed by the rubber companies, probably 20,000,000 pounds annually, and 10,000,000 pounds exported for foreign trade in normal times.

TESTING METHODS.

The final test of the suitability of a black for a given purpose is the actual trying out of the working qualities. In rubber making a sample mix is made and the finished piece tested for tensile strength, per cent elongation, toughness, and resistance to abrasion.

There are, however, a number of laboratory tests which are of use in matching a standard sample. The tests most commonly employed are for tinting strength, color, and grit. It is also desirable to determine moisture, ash, and acetone extract.

TINTING STRENGTH.

According to the American Society for Testing Materials, tinting strength is "the power of coloring a given quantity of paint or pigment selected as a medium or standard for estimating such power." Tinting strength, then, as applied to carbon blacks is the measure of the ability of the black to impart a color to a definite weight of standard white. It depends on the size of the particles and the specific gravity of the black. In making the test, the black is always compared with a standard black.

Weight out accurately on a sensitive balance, 0.100-gram of the black to be tested and 10.0 grams of a standard zinc white kept especially for the purpose. Transfer to a glass or marble slab and add from a burette exactly 3.5 cc. refined linseed oil. Mix with a palette knife and rub out thoroughly with the palette knife (or, better, a glass muller) until no streakiness or difference of color is observed, when successive small portions are spread out on a clean piece of window glass and viewed from the upper side. It is important that the rubbing out be thorough; 10 minutes are usually sufficient. Follow the same procedure with the standard black. Then spread a small amount of each mix side by side on a clean glass (a microscope object glass serves the purpose very nicely). Examination of the samples from the other side of the glass, particularly at the line where they overlap, will show the difference in tinting strength.

To make a quantitative estimation of the tinting strength of the sample as compared to the standard, more white is added to the stronger mix until the colors match. A new sample of the stronger black is then weighed out, using the calculated amount of zinc white, and the process repeated until mixes of the same color are obtained. If, for example, it was necessary to mix 15 grams of zinc white with 0.1-gram of the standard to match a mixture of 10 grams zinc white and 0.1-gram of the sample, the latter has two-thirds the strength of the standard.

COLOR.

By this term is meant the relative blackness of the material when mixed in oil.

To 0.3 gram of each of the blacks to be compared add 1.3 cc. of refined linseed oil from a burette. Mix thoroughly with the palette knife and spread side by side on a slip of glass and compare the relative color by viewing from the upper side of the glass.

GRIT.

Presence of gritty matter is determined by rubbing a portion of the black under the finger or by placing a small amount on the tongue and rubbing between the tongue and palate.

CHEMICAL TESTS.

It is occasionally desirable to make a few quantitative chemical tests of carbon black. A black containing more than 0.2 per cent ash is probably adulterated with mineral black or charcoal. An acetone extract over 0.1 per cent indicates adulteration with a poorly calcined lampblack. Too great a percentage of moisture is undesirable from the point of view of working qualities. Certain blacks will absorb as much as 15 per cent of their weight of moisture, making a total moisture content of 20 per cent

or more. More blacks for ink making contain from 2 to 4 per cent of moisture, although certain blacks may contain as high as 7 per cent.

MOISTURE.² A 1-gram sample of the black is placed in a weighed porcelain crucible and heated for one hour at 105 degrees C. in a constant temperature oven in circulating dry air. The crucible is then removed from the oven, covered, and cooled in a desiccator over sulphuric acid. The loss in weight multiplied by 100 is recorded as the percentage of moisture.

ASH.³ The crucible containing the residue from the moisture determination is heated gradually with a Meker burner (for better, in a muffle furnace) to cherry-red (about 750 degrees C.). Ignition is continued until all the particles of carbon have disappeared. The crucible is then cooled in a desiccator and weighed, after which it is heated again for 15 minutes, cooled in a desiccator, and reweighed. If the change in weight is more than 0.0002-gram, the process is repeated until successive weighings are constant to this figure. The weight of the crucible and ash minus the weight of the crucible is taken as the weight of the ash.

ACETONE EXTRACT. A 2-gram sample is weighed into an alundum or paper extraction thimble of 20 cc. capacity and the extraction carried out for one hour, using any standard apparatus of the Soxhlet type. The weight of the residue after evaporation of the acetone is taken as the acetone extract. The extract for a pure carbon black is usually zero.

SPECIFICATIONS.

The Bureau has received a great many inquiries in regard to tests which a carbon black must meet to be suitable for use in printing ink or rubber.

The following specification represents the requirements for the rubber trade. It should be realized that there are no hard and fast specifications for carbon black, and that the test on which a black stands or falls is the practical test.

CARBON BLACK FOR RUBBER COMPOUNDING.

CHEMICAL TESTS.

Moisture—Less than 4 per cent.
Acetone Extract—Less than 0.5 per cent.
Ash—Less than 0.25 per cent.

PHYSICAL TESTS.

Grit—None.
Tinting Strength—Not less than 90 per cent of the strength of standard.

PRACTICAL TESTS.

Rubber mixes are made up containing equal weight of the sample to be tested and of the standard. Mixes are cured under exactly the same conditions. The finished sheet is tested for tensile strength, per cent elongation, toughness, and resistance to abrasion.

CHEMICAL ANALYSIS.

Carbon blacks consist of from 85 per cent to 95 per cent amorphous carbon, 1 per cent to 7 per cent water, 0.5 per cent to 0.8 per cent hydrogen, and from 2 per cent to 8 per cent oxygen, present partly as CO and CO₂, and partly as fixed oxygen.

² For details of method, see F. M. Stanton and A. C. Fieldner, "Methods for Analyzing Coal and Coke," Bureau of Mines, Technical Paper 8.

BENZOL POISONING.

Benzol or benzene is one of the most important industrial poisons. Poisoning due to benzene may occur in the manufacture of aromatic hydrocarbons, or in the technical use of products containing these hydrocarbons, for example, in the removal of grease from goods, and in the manufacture of varnish and rubber. The poisoning may be mild or severe, acute or chronic, and may have fatal results. When man is exposed to a mixture of benzene and air, he absorbs 80 per cent of the ben-

zene; the limit for animals is from 0.015 to 0.016-part of benzene to 1,000 parts of air. Distillations should be carried out in impervious apparatus with well-cooled condensers. All apparatus which has contained benzene should never be entered for cleaning or repairs until all benzene has been removed, and thorough ventilation has occurred. The workmen should have approved breathing apparatus. A person overcome by benzene should be removed into fresh air promptly, and given artificial respiration. Women are more susceptible than men to benzene poisoning. (R. P. Albaugh, "Modern Medicine," 1919, volume 1, page 670.)

CHEMICAL PATENTS.

THE UNITED STATES.

LEATHER SUBSTITUTE, comprising rubber and wax of the montan class. The composition has the tough slow-flexing qualities of leather and is devoid of the springy, elastic qualities of rubber. (John D. Prince, Boston, Massachusetts. United States patent No. 1,336,858.)

DRESSING FOR LEATHER, ETC. A quick drying dressing for leather and the like, consisting of the following ingredients in the proportions stated: asphaltum, 1 gallon; benzine, 1 gallon; rubber cement, 1 quart; black pigment, 1 pound; Japan drier, 1 pint; beeswax, $\frac{1}{4}$ pound. (Alfred R. Caldwell, Pasadena, California. United States patent No. 1,338,286.)

THE UNITED KINGDOM.

ELECTRIC CABLE COMPOSITION.—For a protective and insulating covering, rigid when cold, but readily pliable when warmed, which permits the cable to be laid against irregular surfaces by heating it at the necessary parts. It comprises rubber combined with a large proportion of sulphur to which may also be added asbestos, shellac, gutta percha, balata, silica, magnesia, chalk, zinc oxide and the sulphates of antimony. When applied to the cable the composition is vulcanized to produce a covering of the nature of ebonite. The following percentage proportions are given: rubber 35, reclaimed rubber 15, rubber substitute 5, ebonite dust 10, silica 10, magnesia 10, and sulphur 15. (T. S. Seymour, 20 Mount Carmel, Derby, and St. Helens Cable & Rubber Co., Arpley, Warrington, England. British patent No. 139,226.)

AUSTRALIA.

PRESERVING INDIA RUBBER.—To prevent the oxidation of rubber goods, the enzymes are destroyed by the application of a 10 per cent solution of ammonia containing about 0.3 per cent of a saponaceous substance such as sodium oleate, laurate and stearic acid, carbonic acid or other antiseptic substance which will not precipitate the soapy material. The solution is applied to the latex, or to flexible rubber goods by immersion or by repeated superficial application. (F. E. Stowe, New South Wales. Australian patent No. 3,364.)

RECLAIMED RUBBER. Process for recovering rubber from waste. (Acushnet Process Co., assignee of T. F. Furness, Pennsylvania, and P. E. Young, Massachusetts, inventors. Australian patent No. 11,970.)

THE FRENCH REPUBLIC.

RECLAIMED RUBBER. Process for recovering rubber and cotton from waste. (Acushnet Process Co., Inc. French patent No. 501,214.)

GERMANY.

RECLAIMED RUBBER. Process for reclaiming rubber from soft, elastic, and tensile vulcanized goods. (Farbenfabriken, formerly Friedrich Bayer & Co., Leverkusen, near Köln am Rhein. German patent No. 303,984 "K.")

RECLAIMED RUBBER. Process for reclaiming rubber from vulcanized substances, having great stretching qualities, firmness, and elasticity. (Farbenfabriken, formerly Friedrich Bayer & Co., Leverkusen, near Köln am Rhein. German patent No. 305,667 "K.")

LABORATORY APPARATUS.

LABORATORY BURNER.

A NEW FORM of burner for laboratory use is that known as the "Fisher." Although but recently introduced it is rapidly finding favor with chemists.

It is provided with perforated nickel grid for hot flame and brass cap for Bunsen flame, thus combining the features of two burners in one. It will produce a flame $1\frac{1}{4}$ inches in diameter, all of which is hotter than the hot tip of a Bunsen flame, or it can be adjusted to give a clear Bunsen flame, $7/16$ inches in diameter. It will burn any gas except acetylene. (Scientific Materials Co., Pittsburgh, Pennsylvania.)

THE FISHER BURNER.

AUTOGRAPHIC FABRIC TESTING MACHINE.

A recently patented autographic fabric testing device, as shown in the illustration, consists of a horizontal fabric testing machine and a chart holding mechanism. The latter

is appropriately connected by means of lever and cord and pulley attachments with the grips A, B, holding the fabric test sample C. The frame carrying the chart is thus made to move horizontally in fixed relation to the strain upon the fabric, and vertically in accordance with the elongation of the fabric. Thus, a curve may be traced on the chart

FABRIC TESTER.

D by a suitable marker which will record the relations of tensile strength and elongation of the specimen under test. (Alfred E. Jury, Newark, New Jersey, assignor to the United States Tire Co., New York City. United States patent No. 1,327,393.)

ALUMINUM FUNNEL SUPPORT.

Stoddard's aluminum funnel support here illustrated is an improvement over the usual clumsy, wooden, two-funnel support. It is arranged for the use of four two-inch or two and one-half inch funnels within a small space.

The stand is clean, neat and not easily corroded. (Central Scientific Co., 460 East Ohio street, Chicago, Ill.)

STODDARD'S FUNNEL SUPPORT.

is then further compressed and passed into the condenser 8C.

The solvent condensed out in these three coolers is drawn off by gravity to a separation tank 14 where it is separated from any accumulated water, and the residual inert gas reduced to approximately atmospheric pressure by 13 is passed back into the impregnator housing. The system is thus essentially a complete cycle, except as additional flue gas is added to replace losses that must necessarily occur. (Lewis Recovery Corporation, Room 1206, 68 Devonshire street, Boston, Massachusetts.)

AKRON-WILLIAMS TIRE REPAIR NOVELTIES.

Tire repairing as a business will attain a greater development in direct proportion to the energy exercised in building better repairs. That progress is constantly being made in the development of tire repair equipment, to the convenience and economy of repairmen, is shown in the accompanying illustration. On the left is an inverted tube vulcanizer, unique in its adaptation of a principle giving greater efficiency and ease of manipulation. The tube hangs down away from the heat during the cure. The

INVERTED TUBE VULCANIZER.

UNIVERSAL BOILER.

pressure bars are controlled by foot-pedals enabling the repairman to have both hands free to adjust tube on the hot plate. A feature of construction, when this outfit is built to use gasoline as fuel, permits it to be pushed about the garage or repair shop floor at the convenience of the operator.

The special one-and-one-half horse-power boiler or generator shown in the illustration on the right is of vertical tubular type and of steel construction throughout. It is readily convertible from gas or gasoline burning to coal or coke burning with the addition of a small section which fits to the bottom of the boiler unit. This boiler has a very low water line, permitting a gravity return from the vulcanizing units without necessitating the placing of the boiler in the basement or on the next lower floor. (The Williams Foundry & Machine Co., Akron, Ohio.)

CHAMPION TIRE BUILDING STANDS.

Spinning the tire with one hand and using the various tools with the other is eliminated in this machine as the operator has both hands free and can revolve the tire either forward or reverse, at any speed and at any angle, by operating a foot-lever.

These stands are made in three different types. The one shown in the illustration is the base with four projecting arms, enabling four men to work at the stand. The second is the

FOUR-MAN BUILDING STAND.

base with two arms parallel with each other, enabling two men to work at the same stand; and the third is the single stand for one man.

The four-man base can be sold with one arm and other arms can always be added as the manufacturer requires them. There are ball bearings on both the main drive shafts, thereby making the machines noiseless and easy to run. (The Braendel Engineering & Machine Co., 724 Dearborn street, Louisville, Kentucky.)

MACHINE FOR COATING INSIDE OF CASINGS.

The problem of coating the inside surface of casings with a preparation so that the casing and tube will not adhere, has been solved by the machine here pictured. After a long period of satisfactory service, and after basic patents have been granted, it is now being brought to the attention of the trade.

The outstanding features of the machine are speed of operation and simplicity. From six to ten tires per minute are lined evenly from head to head, and without wasting the liquid, thereby saving at least two-thirds of it as compared with the present hand-swalling method. Three tires are rotated at a time in a vertical position on drums driven by a small electric motor. The beads of the center tire are held apart by a dished wheel having an operating handle. This permits the spraying device,

TIRE LINING MACHINE.

which is attached to the handle, to evenly coat the inside of the tire as it revolves. The drum on the left supports the casing to be lined, while that on the right is being rotated to dry the coated casing.

When the center tire has made one revolution, the operator throws up the handle, which stops the spraying and causes all three tires to roll towards the right, thus placing another shoe in position to be coated, and rolling the finished tire into the wrapping room. The complete machine is 7 feet high and occupies a floor space 4 by 12 feet, and may be operated by a girl or one-armed man. (The O. Hammel Co., 209-213 Fourth avenue, Pittsburgh, Pennsylvania.)

S. & B. FLEXIBLE STEEL MOLDS.

Flexible steel molds for making straight-side or clincher tires by the full molded process are said to have fully demonstrated all claims made by the manufacturer.

FLEXIBLE STRAIGHT-SIDE MOLD.

The curing of either fabric or cord tires on solid collapsible cores is made easy. Each half of the mold is provided with saw cuts to allow contraction of the inner diameter of the mold. Each half is dished and made to come together at the tread first, then by applying pressure the mold is closed gradually and progressively toward the beads, forcing the air and excess rubber ahead of the contact points, stretching the fabric also and finally landing the surplus rubber into the overflow cavity A, while all harmful movements of stock toward the tread are eliminated.

By this process it is possible to use beads of larger diameter than those generally used, leaving more space at B, and more room for contraction of bead diameters, which allows more stretch to the sides of the tire carcass during vulcanization. Before placing the tire in the molds, beads and sides of tire are pulled loose from the core to the tread line C, leaving the tread portion cemented to core. (Swinchart & Byrider Process Co., 212 Second National Building, Akron, Ohio.)

HIGH PRESSURE SECTIONAL VULCANIZER.

An improvement over the old-style kettle, or wrapped process, is claimed for the Soper high-pressure retreading machines and sectional molds. Among the advantages noted are: wood fiber

marking blocks that keep the rubber from overflowing; semi-cure, keeping the rubber from over-curing on lap, which often causes a weak spot on the retread; no matrix to break, as the ribs are cut in the mold; inclosed fire-box, giving four times the heating surface found in ordinary molds and making

steaming up 50 pounds possible in 20 to 25 minutes; hand-forged clamps that are practically unbreakable.

THE SOPER RETREADER.

The vulcanizers have self-contained gas-heated boilers, although kerosene burners can be supplied if desired; and they are made in six types, suitable for the smallest oil station or the most completely equipped retread shop. (Soper Vulcanizer Manufacturing Co., 110 East Eleventh street, Los Angeles, California.)

HONECO VULCANIZER TEMPERATURE CONTROLLER.

In this device two controlling systems are compactly combined in one casing, one system to control the inlet steam for maintaining the temperature in a vulcanizer, tire press, retort or any

closed space, and the other to control the discharge of condensation and wet steam from the same apparatus. While this combination of two controlling systems in one casing is not new, however, the systems themselves are novel, and interesting.

AIR-OPERATED CONTROLLER.

There are no fulcrums and levers that require delicate bearings and accurate adjustment and alignment. A valve is located within the adjusting plug, and the latter projects through the front of the casing, permitting the removal of the valve, without the necessity of removing the casing or loosening any connection for adjustment of the air-plug.

The air valve is the most important part of the operating mechanism of any air-operated controller. The Honeco valve is held against its seat by the tension or compression of the spring and is lifted by the expanding capsular diaphragm when inflated by the pressure actuating it. The upward movement of the diaphragm prevents the valve freezing to its seat because of gumming or corrosion. The adjustment or setting is made with a small wrench and as the entire valve is turned, there can be no change of temperature or pressure while adjustment is being made. (Hohman-Nelson Co., Eau Claire, Wisconsin.)

INNER TUBE VALVE NUT TIGHTENER.

The simple but important process of running up the valve nut on the stem of an automobile tire valve is speedily and securely

VALVE NUT TIGHTENER.

Jone by various devices, one of which is shown in the accompanying illustration.

In this machine a small electric motor rotates a direct-connected hollow spindle, the entrance to which forms a socket wrench for the reception of the valve nut. In front, a suitable guard is placed which serves as a support against which the operator holds the inner tube and valve base during the tightening process. There is a special clutch with a spring attachment designed to eliminate any danger of the tube catching and turning around while the operator is holding it. (Gillette Rubber Co., Eau Claire, Wis.)

MACHINERY PATENTS. MANDREL FOR TIRE TUBES.

A DISCONTINUOUS torus-shaped sheet metal mandrel *A* for forming and curing forced inner tubes is shown in the illustration, together with a suitable bench bracket device *B*, supporting the mandrel for the application and removal of the tube *C*, assisted by compressed air.

CURING MANDREL FOR INNER TUBES.

Cleveland, Ohio. United States Patent No. 1,330,785.)

MACHINE FOR MAKING INNER TUBES.

Inner tubes are built up from strips of rubber stock delivered directly from the calender roll and wound on mandrels that are continuously fed in a line parallel to the calender.

A represents a 3-roll calender on which is mounted the mechanism *B* for rotating the mandrels *C* and simultaneously moving them parallel to the calender rolls. The

INNER TUBE BUILDING MACHINE.

The mandrels are constructed so that they can be detachably joined in longitudinal alinement. The strip cutting knives are shown at *D*, and at *E* the strips of rubber stock.

In starting the winding the strip indicated at (*a*) is wound on the mandrel to form the inner layer or lamination; the strip indicated at (*b*) is wound on the first layer to lap the convolutions of the strip (*a*), and then the strips (*c*), (*d*), (*e*) and (*f*) are successively wound on each other to have succeeding strips overlap the convolutions of preceding strips and to form the layers or laminations of material. Thus, after starting the winding on the first mandrel, the winding of subsequent layers to form a tubular covering on a series of detachably connected mandrels can be continuously performed.

After the strips of material have been wound on the mandrels, the material is cut transversely at the junction of adjacent mandrels, and the separate mandrels with the material thereon are prepared for vulcanization in the usual manner. (William

C. Tyler, Racine, Wisconsin, assignor to The Goodyear Tire & Rubber Co., Akron, Ohio. United States patent No. 1,332,774.)

501,209. Manufacture of pneumatic tire casings. J. L. G. Dykes.

NEW TRADE PUBLICATIONS.

IN THE NUMBER FOR APRIL-MAY OF "THE PORTAGE," THE HANDSOME little monthly magazine issued by the Portage Rubber Co., Akron, Ohio, John W. Maguire, vice-president and general manager, pays a graceful tribute to the branch managers and explains their importance to the business. The number contains portraits of all the branches and office managers of the company from Boston to the Pacific coast, with many other illustrations.

ZWEBELL BROTHERS CO., MILWAUKEE, WISCONSIN, HAS PUBLISHED a profusely illustrated descriptive catalog of 72 pages, devoted to its complete line of tire repair equipment, repair materials and accessories. It covers everything required for the up-to-date repair shop, including sectional cavity vulcanizers and high pressure-retraders of the individual steam-generating type with aluminum bead molds and reducing shells for all tire sizes up to and including 8-inch. The obvious economy and efficiency of these individual steam generators appeal to every repair man.

THE EAGLE RUBBER CO., ASHLAND, OHIO, PUBLISHES A MOST attractive catalog, illustrated in colors, of the many rubber toys it makes. The cover shows a baby girl with her puppy borne aloft by a bunch of little balloons of many hues. Balloons of many shapes are seen, some with noise-making attachments. The prize novelty, however, is the "Eagle Brand" bag-pipe, with a plaid bag, that should satiate youth's craving for noise.

TO SPREAD INFORMATION ABOUT THEIR MOTOR WHEELS AND THE many uses to which they may be put, the Briggs & Stratton Co., Milwaukee, Wisconsin, are issuing a handsome illustrated monthly magazine, called "The Motor Wheel Age."

A VALUABLE HELP FOR ENGINEERING AND KINDRED TRADES IS THE "Industrial Arts Index," published by The H. W. Wilson Co., New York City. In alphabetical arrangement, but with many convenient sub-heads, it supplies a subject catalog to the periodicals dealing with engineering and various trades and technical industries. Volume VIII, No. 3, for March, 1920, covers the first three months of the year.

"HOLLAND'S EAST INDIA," WHICH UNDER THE MANAGEMENT OF A. A. van der Kolk, has separated from the Buitenzorg, Java, "Dutch East Indian Archipelago," publishes an edition in French, "Les Indes Hollandaises," as well as an English edition.

"TRANSATLANTIC TRADE," JANUARY, 1920.—THIS IS A MONTHLY magazine published in the English language by the American Association of Commerce and Trade in Berlin, members of which seem to have penetrated into Germany as soon as hostilities ceased. Instructions are given to Americans as to how they may enter Germany equipped for business, and how they may secure protection if they need it. Lists of firms that are permitted to deal with America are printed, and also of the goods that are most needed.

THE FIRST NUMBER FOR 1920 OF THE "Bulletin des Caoutchoucs" of the *Marseille Institut Colonial* contains the report and recommendations of Dr. G. van Pelt, the director, on the rubber conditions in the French colonies, where he spent several months last year. He describes French Guinea and the Ivory Coast, tells how cultivation and the processes of preparing and packing the rubber should be changed in accordance with his ideas, and how the African natives may be induced to better their ways. France clearly intends to make a fight for her share in rubber, and Dr. van Pelt's investigation is one of the first steps taken.

JOSEPHINE A. CUSHMAN, ASSOCIATE LIBRARIAN, IN THE FIRST number of "Faculty Studies," issued by the Municipal University of Akron, explains what "a special library for the rubber industry" should contain, and in the footnotes gives excellent and

helpful abridged bibliographies of many branches of the subject. The appendices give the most essential scientific journals and government publications with which a rubber library should start.

THE EDITOR'S BOOK TABLE.

"REPORT OF THE CEYLON CHAMBER OF COMMERCE (INCORPORATED) for the year ended 31st December, 1919." (Paper covers, 346 + 18 pages, charts, tables.)

THE "Report of the Ceylon Chamber of Commerce (Incorporated) for the year ended 31st December, 1919," contains the usual important tables and statistical information regarding crude rubber exports and imports from and into the island, with charts, including one in colors, giving rubber prices at local auctions. The larger portion of the volume is taken up with official correspondence and documents, and with the minutes of the meetings of the Chamber.

"AIRCRAFT YEAR BOOK, 1920." MANUFACTURERS' AIRCRAFT Association, Inc. Droulley, Page & Co., New York. (Cloth, octavo, 9 1/2 by 6 inches, 314 pages.)

The second yearly issue of the "Aircraft Year Book," besides interesting articles on the development of aircraft in commerce and in war, and reports on the activities of the Manufacturers' Aircraft Association, contains a compact and instructive summary of the technical development of balloons and airships in the years since the beginning of the war. In this, some account is given of the important construction work done in this line during the war by The Goodyear Tire & Rubber and The B. F. Goodrich companies. There are many fine illustrations and useful lists and tables.

REPORT TO THE BOARD OF TRADE OF THE EMPIRE COTTON Growing Committee, 1920. London, His Majesty's Stationery Office. (Paper, 67 pages, 7 maps.)

The report submitted to the British Parliament last October by a committee appointed in the summer of 1917, at the instigation of the British cotton interests, to survey the possibilities for raising cotton within the empire, has been mentioned in the press for some time, but now appears officially.

It is of particular interest because of the desire, openly expressed in many English newspapers, to free the British cotton industry from dependence on the United States. The survey includes Africa, with the possessions recently acquired from Germany, as well as India, the West Indies, and other portions of the empire, where cotton is raised, and is illustrated by the maps. The example of the supremacy that rubber production acquired in a dozen years by the British in Malaya, Ceylon and Southern India, inspired the committee, and should give food for reflection to the American cotton planters.

"DYKE'S AUTOMOBILE AND GASOLINE ENGINE ENCYCLOPEDIA." By A. L. Dyke, E. E. Twelfth edition, A. L. Dyke, St. Louis, Missouri. (Cloth, large octavo, 10 by 7 inches, 940 + 22 pages, profusely illustrated.)

This compendious repository of automobile information is now in its tenth year, the editions following on one another faster than once a year. The elaborate indexes are a necessary guide through the maze of instructions about the construction, mechanism, handling, adjusting and repairing of automobiles, their engines, the ignition, lubricating, electric systems, tires and their troubles and the myriad matters on which immediate practical information may be needed; everything illustrated fully with pictures and diagrams. Special supplements are added to this edition on airplanes, Liberty engines, the Ford and Packard cars and the K. W. Magneto, together with inserts supplying additions of very recent information to many articles.

BY ARTICLE 307, SECTION 2, OF THE TREATY OF VERSAILLES, CARRIED INTO EFFECT by the Reichs Law of August 31, 1919, all patents and trade marks which were declared void on account of non-payment of dues during the period between August 1, 1914, and January 10, 1920, are declared valid as from the last-named date.

New Goods and Specialties.

A SAFETY AXE FOR THE SUMMER CAMPER.

Now is the time when plans are going forward for summer camping trips, and no outfit is complete without a reliable axe or strong hatchet with which to blaze trails, cut trees, boughs, and firewood, and do the numberless odd jobs that fall to the lot of the camper. That dealer who can supply his customers with an axe provided with a guard so that it can with safety be put into the coat pocket or packed with other articles without danger of injuring them, should benefit by increased sales. The safety pocket axe shown here has a nickel-plated spring hinged guard lined with lead, that folds into the handle. The blade is made of carefully tempered tool steel, while the metal handles are drop forged, with side-plates of rubber. The length is 11 inches and the weight 20 ounces. (Marble Arms and Manufacturing Company, Gladstone, Michigan.)

SAFETY POCKET AXE.

COMBINATION INK AND PENCIL ERASER.

Designed for the use of the typist who requires a soft eraser to remove pencil marks and carbon impressions as well as inked or typed copy, the "399 Tri-Ply" eraser has found a welcome in the business world. The two outer layers of rubber are soft and velvety, while the center layer is of harder stock. When the center edge is brought to bear upon manuscript written with pen or type-

"399 Tri-Ply" RED ERASER.

writer, erasing becomes easy. The side edges are used for removing pencil marks. (Weldon Roberts Rubber Co., Newark, N. J.)

A NEW OVERSHOE TIRE.

The tire illustrated claims a new patented feature in a tread which is removable and interchangeable and can be used on all makes of tires as well as on this specially constructed one. The overshoe is made in a separate piece and its inner face opposite the casing is provided with longitudinal and transverse projections and recesses to correspond to those in the tire. This feature insures against creeping, either longitudinally or transversely. There are also a number of suction cups in the inner face of the overshoe, in the thickened side portions,

"MULLIKIN" OVERSHOE TIRE.

which hold the sides firmly in position on the casing. The tread portion is made of durable rubber and the overshoe is not vulcanized to the casing. The casing, protected by the overshoe, does not come in contact with the ground and is not exposed, therefore wearing indefinitely long. (Brooks J. Mullikin, Box 23, Station N, New York City.)

"THE CRAWDAD NATURAL CRAB."

A NEW ARTIFICIAL BAIT.

The angler who enjoys game fishing will welcome this new "Crawdad Natural Crab" bait, with its body so true to life in color and shape, its beady black eyes, and its moving rubber legs. The hooks are bronze. (The Creek Chub Bait Co., Garrett, Indiana.)

THREE NEW WESTERN TIRES.

Three good-looking tires will be produced by a new Western rubber company, as well as an inner tube. The center one of the three tires below is the invention of Grant Lambright, the company's general superintendent. It is intended chiefly for light trucking and has been successfully tried out and tested. It combines the advantages of

LATEX NON-SKID.

LAMBRIGHT CUSHION.

RIBBED TREAD.

a pneumatic with those of a solid tire. The non-skid tread is designed to distribute road friction evenly, while the ribbed tire has extra thick side walls. (The Latex Tire & Rubber Co., Fond du Lac, Wisconsin.)

AN IMPROVED STEP-MAT.

The particular feature of the step-mat pictured here is a flap which turns up from the running-board and prevents the scratching of the car by overstepping. The pattern is of the self-draining type, so that any water collected is thrown away by the forward motion of the car. The rubber used is of good quality and serviceable. A running-board mat of this kind is an admirable preventive of slipping when entering a car. (Essex Rubber Company, Trenton, New Jersey.)

"ESSEX IMPROVED" STEP-MAT.

THREE BATHING CAPS FOR SUMMER DAYS.

The "Tiger Lily" bathing cap pictured here has a red, blue, green, or yellow body with a large black striped flower. The

"TIGER LILY."

"COLLEGE CAP."

"DAISY."

"College" cap is patterned after the familiar "mortar board," with long streamers, and wooden buttons suspended from the corners. The "Daisy" comes in the same colors as the "Tiger Lily" and has each petal apparently fastened down with a rubber button, while a black celluloid buckle forms the center. (The Miller Rubber Company, Akron, Ohio.)

HAIR BRUSH WITH RUBBER CUSHION.

The dainty woman likes a hair brush that can be thoroughly cleaned from time to time, and the one illustrated here accomplishes this by means of a removable rubber cushion to which the high-grade, stiff black bristles are vulcanized. The cushion is removed by means of a button which pulls out as shown in the picture. (O. Dennin's Sons, Inc., Troy, New York.)

"BEAUTIFIER" SANITARY HAIR-BRUSH.

"ADHESO" MILLINERY GLUE.

A strong millinery glue or rubber cement which is waterproof, colorless, durable, and will not burn or explode, is called "Adheso." It has been tested by the National Board of Fire Underwriters and favorably reported on. This glue is used in various ways in applying trimming to hats, as well as for the insertion of hat linings without sewing. (James B. Day & Co., 214 West Ohio street, Chicago, Illinois.)

STANDARD AND OVERSIZE CORD TIRE.

A cord tire which is made in both standard and oversize sizes enables the car owner to procure either or both for the asking. The conformity of this tire to the original fabric size standards and the standard oversizes make for easier riding and more mileage, without wrenching and straining

THE "ODELL" CORD TIRE.

of the differential and the chassis. The "Odell" cord, it is claimed, insures perfect balance and distribution of the weight

of the car. This is a quality tire, hand manufactured. (International India Rubber Corporation, South Bend, Indiana.)

A NEW FABRIC-RUBBER SOLE.

A new fabric-rubber sole is called the "Gro-Cord." In principle its construction follows that of the wood paving block which presents its cross-grain side to traffic. This sole is composed of rows of cord fabric set on end in sequence and vulcanized into the pliable rubber body so that the ends of the cords present themselves on the walking surface. It is claimed that the "Gro-Cord" sole will not cause the sensation of burning sometimes experienced when rubber soles are worn, and that it is water-proof, noiseless, flexible, and non-slipping. The base of this sole is thin, strong fabric, vulcanized to the sole proper. This prevents bulging or stretching. The sole is left the full thickness at the shank and has two plies of strong fabric on the bottom running forward under the tread to strengthen the shank and keep the sole from breaking. Because of its construction, the "Gro-Cord" sole may be attached to shoes by stitching.

This sole was formerly made by the Firestone Tire & Rubber Co., Akron, Ohio, under agreement with the inventor, J. E. Grosjean, and was known as the Firestone fabric-sole. When the Firestone company decided to discontinue the retail end of its boot and shoe business, the inventor purchased the equipment for the manufacture of this sole and formed the present company to produce it. (The Lima Cord Sole and Heel Company, Lima, Ohio.)

THE "GRO-CORD" FABRIC SOLE.

RUBBER-INSULATED COIL-BOX PROTECTOR.

A coil-box protector which keeps out rain and snow and makes short circuits impossible, it is claimed, is shown here. Rubber bushings are inserted in the holes in the plate which forms the protector, and through these bushings pass the electrical connections. (Charles F. Lyngaas, 135 Wooster street, New York City.)

"CASCO" COIL-BOX PROTECTOR.

THE "CELOGLAS" SAFETY GOGGLE.

Among the numerous safety goggles now to be had, the one illustrated here claims a peculiar lens construction consisting of a thin sheet of celluloid cemented between two sheets of glass so as to prevent the glass from flying or falling out of the frame when cracked or broken. These goggles are equipped with side shields of perforated nicked metal and are held in place by

"STICO 'CELOGLAS'" GOGGLES.

elastic webbing which buckles around the head of the wearer. (Standard Optical Company, Geneva, New York.)

THE "WILLSON" SAFETY GOGGLE.

A safety goggle with novel provision for the renewal of the rubber tubing which binds the edges coming in contact with the face of the wearer has aluminum cups with serrated edges. Over the serrations the rubber tubing is fitted by means of short slits. A short piece of rubber tubing is slipped over the leather strap which connects the goggles over the nose. The lenses of these goggles are set in a frame so designed, it is claimed, that if the glass is broken it must fall out instead of in. Besides, the lenses in their frames may be removed by sliding forward the clamp to which the elastic head-bands are attached. (Willson Goggles Inc., formerly T. A. Willson & Co., Inc., Reading, Pa.)

THE "WILLSON" SAFETY GOGGLE.

A VALVE THAT LOCKS THE AIR IN THE TIRE.

The "Air Lock" tire valve is so constructed that it locks the air in the inner tube for an indefinite length of time, until the tire suffers a blowout or puncture. This valve may be used with any cap, nut, or cleat. The use of a new inner tube is recommended, but an old one which is known not to leak may be used. It is claimed that a permanent degree of pressure may be maintained within the tire by means of this valve, which tends to increase tire life and mileage. The centers of these valves are interchangeable. Five standard sizes are available, for wire, disk, and artillery wheels—2, 2½, 3, 3½ and 4-inch. (The Griffin Manufacturing Co., Inc., 113 State street, Boston, Massachusetts.)

"AIR-LOCK" VALVE.

VACUUM CUP LADDER STAY.

The vacuum cup principle has been employed in working out this safety device for holding ladders in position. A clamp of malleable iron, which is adjustable, fits around the lower rung of any ladder. Through this clamp is inserted a rod, also of malleable iron, whose lower end is cut on a bevel of eight degrees, so that no matter at what angle the ladder is placed, the safety stay exerts a direct downward pressure. The bottom of the rod is adapted for holding a rubber suction cup or a steel point, depending on the nature of the surface on which it is to be used. When the device is not in use, it may be moved over to one side of the ladder and folded up out of the way, if it is not convenient or desirable to remove it entirely. (Maxwell Safety-Ladder-Stay, 101 West 43d street, New York City.)

MAXWELL LADDER STAY.

"DURATOP" RUBBER-COATED FABRIC FOR AUTO TOPS.

A new material for automobile and carriage tops, curtains, etc., is "Duratop," which has a heavy woven cotton backing

coated with rubber. The weight of the material varies according to the purpose for which it is intended to be used. The trade mark has just been registered in the United States. (The Duratex Company, Newark, New Jersey.)

RUBBER MATS BEHIND THE SODA FOUNTAIN.

A new mat, made in one size, color and thickness only, has been designed for use behind soda fountains. It is made with stout rubber disks on the bottom, which hold it one-quarter of an inch off the floor, permitting free drainage beneath. The top layer is of fine, flexible mat stock, corrugated to give a firm footing. Perforations in the mat permit the drainage of any liquid spilled upon it. The mat is 18 by 24 inches. (United States Rubber Company, New York City.)

PATENTED

FLAT TIRE ALARM.

IT WARNS WHEN TIRE IS FLAT.

A unique device for warning the automobile driver when his tires are becoming flattened is shown in cross-section in the diagram at the right. A winged nut which forms the end of the valve stem is embedded in a ball of rubber. Whenever the air inside the inner tube becomes reduced as much as

fifty per cent, this ball causes a slight bump as the tire revolves. (Columbus Rubber Mills, successors to Tomah Rubber Corporation, Milwaukee, Wisconsin.)

"NOKUT" TIRE PLUG.

tire; (2) rubber anchored and chemically welded to metal cores; (3) rubber packing unites cap with base, preventing metal from touching tire; (4) arched cap to conform to tire surface; (5) no open slot to leak; (6) inserting point, with rubber cement, is easily forced into puncture; (7) threaded stem of strong steel so that "Nokut" rubber can be clamped solidly without stripping stem. (Stevens & Company, 375 Broadway, New York City.)

A REINFORCED HEEL AND NEW HALF SOLE.

A new non-skid, reinforced rubber heel and sole are illustrated herewith. The heels are made right and left and the outside corner is reinforced with a heel-plate designed to give additional rubber where most people find the greatest amount of wear. The "Paris" heel is made in two sizes only. A and B, and has a concave under surface and a flat upper surface. It is designed to fit only French heel shapes.

The "Portland" non-skid half-sole is made with both plain and corrugated half surface and includes the original feature of the shank edge reinforced with plies of canvas to hold the heads of the nails. Patents are pending. (Portland Rubber Mills, Portland, Oregon.)

"PARIS" HEEL.

The Obituary Record.

PROMINENT IN THE LEAD INDUSTRY.

OLIVER SHEPARD PICHER, president of The Eagle-Picher Lead Co., died after a short illness of pneumonia, at his home in Winnetka, Illinois, April 20, 1920.

OLIVER S. PICHER.

Mr. Picher was born at Springfield, Missouri, but spent his boyhood and youth in California. He was a graduate of Leland Stanford Junior University and Columbia Law School. After three years in the office of Elihu Root, of New York, he went to Joplin, Missouri, where his father, Judge O. H. Picher, was president of The Picher Lead Co., with the intention of practicing law there, but soon became interested in manufacturing and abandoned the law for business. In 1906 he became secretary of The Picher Lead Co., a position which he held for three years, until he was elected

president to succeed his father, who had retired and gone to live in California.

In 1916 The Eagle White Lead Co. and The Picher Lead Co. were merged into The Eagle-Picher Lead Co., and Mr. Picher became president of the consolidated companies, a position which he filled with success until his death.

He was director and chairman of the finance committee of the American Zinc Institute; a member of the Society of Colonial Wars, Sons of the Revolution, and Columbia Chapter of Alpha Delta Phi. His clubs were the University, Mid-Day, Union League, Evanston Golf, Indian Hill Golf; and the Midwick Country Club, Los Angeles.

In 1904 Mr. Picher married Emily Stanton, a daughter of William Stanton and a niece of Edwin M. Stanton, President Lincoln's famous Secretary of War, and had four children, two sons and two daughters, Oliver, Charlotte, Stanton and Muriel, all living.

Mr. Picher was a man of unusual vigor, and exceptionally winning personality, so that every man in the company feels his death a personal loss, as do his many friends in the rubber and paint trades. His knowledge, judgment and ability found expression in the business which stands a monument to his talent. Although primarily a business man, he became chief expert in every technical activity of his company. He was an accountant, metallurgist, a mining engineer, a chemist, a manufacturer, a financier, and withal gifted with such rare charm of personality as brought to him literally thousands of friends in the business and technical world.

LEADING CHEMICAL MANUFACTURER.

J. Frank Stone, for many years at the head of the National Aniline & Chemical Co., died in New York on May 10, 1920, in his fifty-fourth year. He was born in Chicago in 1867 and went into the drug business, organizing the firm of Stone & Ware when he was 22. In 1897 he moved to New York, merging with the Schoelkopf, Hartford & Hanna Co. three years later. He became president of the National Aniline company in 1906, re-

taining the office till last year, when he retired. Mr. Stone was vice-president of the Drug and Chemical Club, president of the Chemists' Club, a director of the Schoelkopf Aniline and Chemical Works, Inc., of the Contact Process Co. and Rollin Chemical Co., and belongs to many clubs. He leaves his widow and one daughter.

CHICAGO MANAGER OF TWITCHELL GAUGE CO.

Max D. Bendel, manager of the Twitchell Gauge Co., Chicago, Illinois, died suddenly from heart failure at Chicago on May 7, 1920.

Mr. Bendel succeeded to the management of the Twitchell Gauge Co. in 1912 shortly after the company was acquired by A. Schrader's Son, Inc., of Brooklyn, New York. In addition to his duties as sales executive of the Twitchell company, he also conducted the Chicago branch of the Schrader company. He was highly successful as a salesman and the rapid expansion of the Twitchell business was in a great measure due to his aggressive personality and enthusiasm.

FOUNDER OF THE KAUFMAN RUBBER CO.

Jacob Kaufman, founder of the Kaufman Rubber Co., Limited, the well-known Canadian rubber footwear manufacturer, who died on April 20, was markedly a self-made man. He was born

JACOB KAUFMAN.

on a farm in New Hamburg, Ontario, in July, 1847; went to the village school and learned the carpenter's trade. At thirty he married one of his employer's daughters, moved to Berlin, and started a sash and door factory, which prospered.

Until 1900 his interests were entirely in lumber, in saw mills, in charcoal and wood alcohol factories. Then he became interested in rubber and the Berlin Rubber Footwear Co. Three years later he

started the Merchants Rubber Co., which he sold in 1906 to the Canadian Consolidated Rubber Co., Limited. The following year he started the Kaufman Rubber Co., Limited, at Berlin, which in the late war was rechristened Kitchener, building and repeatedly enlarging the plant, that is now one of the most modern rubber footwear factories in Canada.

Mr. Kaufman took part in the public and religious life of the town he had built up. He leaves his widow, two daughters and two sons, three brothers and four sisters.

OVER THIRTY YEARS WITH TYER RUBBER CO.

Frank Tyler Carlton, purchasing agent of the Tyer Rubber Co., Andover, Massachusetts, died recently at his home in Andover after a brief illness. He was a native of Andover and was always active in the affairs of the community, especially in connection with the church life of the village.

Mr. Carlton began his business career with the Tyer Rubber

Co. in June, 1886, coming to the company immediately after his graduation from high school, and continuing there until several weeks before his death.

EDITOR OF "WILEMAN'S REVIEW."

Joseph Philip Wileman, editor of "Wileman's Brazilian Review," died at São Paulo, Brazil, on April 18, 1920, at the age of 67 years. He was born at Uttoxeter, England, in 1853, and went to Brazil in 1898. He established himself at Rio de Janeiro, where he started his journal and also the printing establishment which he owned, the "Imprensa Inglesa." He took a deep interest in Brazilian finance and economics and was chosen to organize the official statistical bureau, of which he was the head until a few years ago. While in charge he compiled and published the admirable "Brazilian Year Book." Mr. Wileman had long suffered from a lingering disease. He leaves a son and three daughters; the son, H. F. Wileman, will edit and manage the "Review," which will continue.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(806.) A request has been received for the addresses of manufacturers of machinery for making friction fabrics, including friction tape.

(807.) A correspondent desires to buy rubber plates for dress shields, in quantity.

(808.) The names of makers of dipped goods machinery are requested.

(809.) A repairman desires to know how to separate rubber from fabric to make rubber gum and tire cement.

(810.) A rubber waterproofing for canvas covering is required by a manufacturer of surf coasters.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Requests for each address should be on a separate sheet, and state number.

DISTRICT OFFICES.
New York: 734 Customhouse.
Boston: 1801 Customhouse.
Chicago: 504 Federal Building.
St. Louis: 402 Third National Bank Building.
New Orleans: 1020 Hibernia Bank Building.
San Francisco: 307 Customhouse.
Seattle: 848 Henry Building.

COOPERATIVE OFFICES.
Cleveland: Chamber of Commerce.
Cincinnati: Chamber of Commerce;
General Freight Agent, Southern Railway, 96 Ingalls Building.
Los Angeles: Chamber of Commerce.
Philadelphia: Chamber of Commerce.
Portland, Oregon: Chamber of Commerce.
Dayton, Ohio: Dayton Chamber of Commerce.

(32,571.) A merchant in Chile wishes to communicate with makers of machinery for the manufacture of rubber goods, such as rubber overshoes, raincoats, and hot-water bottles. Catalogs requested.

(32,575.) An engineer in Belgium desires an agency for the sale on commission of rubber articles. Correspondence and catalogs in French.

(32,671.) An importer in Turkey wishes to be put in communication with manufacturers and exporters of rubber goods and rubber shoes.

(32,684.) A merchant in Algeria desires an agency for the sale of manufactured rubber articles of all kinds, automobile and truck tires, inner tubes, bicycle and motorcycle accessories, raincoats, pharmaceutical supplies and so forth. Quotations c. i. f. Algeria. Correspondence in French.

(32,694.) A firm in Mexico wishes agency for the sale of

rubber belting. Quotations f. a. s. New York or San Francisco. Catalogs and samples requested.

(32,703.) A commercial agency in Mexico wants agency for sale of druggists' sundries, hot-water bags and bottles, etc. Quotations f. a. s. New York or San Francisco.

(32,721.) A merchant in Switzerland desires an agency for the sale of all kinds of rubber goods and novelties, druggists' and hospital supplies. Quotations c. i. f. Marseilles, France. Cash against documents. Correspondence may be in English.

(32,775.) A company in Danzig wants an exclusive agency for automobiles, accessories, and tires; also wishes to purchase goods on own account. Quotations c. i. f. Danzig. Cash against documents at Danzig. Correspondence in German.

(32,796.) An importer in India wants an agency for the sale of rubber goods of all qualities. Quotations c. i. f. Colombo, Cochin or Tuticorin. Payment by documentary credits at 90 days' sight.

SEVENTY CARLOADS OF ZINC OXIDE.

The illustration shows one of the two trainloads of zinc oxide sent from the New Jersey Zinc Company's works at Palmerton, Pennsylvania, to the tire factories at Akron, Ohio,

A SOLID TRAINLOAD OF ZINC OXIDE FOR AKRON RUBBER MILLS.

as "emergency specials," during the recent railroad strike. There were seventy carloads, weighing about 150 tons, all of the XX lead-free grade. The trains were run on a special schedule almost as fast as passenger trains and relieved the acute shortage of zinc oxide at the rubber plants.

The New Jersey Zinc Company's new plants now under construction will be completed probably in the early fall. The plant at Canon City, Colorado, will furnish a grade of zinc oxide especially suitable for the requirements of the rubber industry.

SUMMER MEETING OF THE S. A. E.

The program is announced for the summer meeting of the Society of Automotive Engineers to be held at Ottawa Beach, Michigan, from June 21 to 25. On Monday, June 21, there will be sessions of the Standards Committee and in the evening, the semi-annual business meeting will be held. Sports have been arranged for every afternoon, and prizes will be given for each contest—base ball, tennis, golf, and some new games. Tuesday, June 22, the fuel session; Wednesday, June 23, transportation; Thursday, June 24, farm power, and Friday, June 25, the labor question and factory organization. There will be exhibits of automotive apparatus, like those of last year.

ORGANIC ACCELERATOR.

Triphenyl guanidine, a highly concentrated product from aniline oil and thiocarbamilid, is quite well known among the rubber laboratories as a vulcanization accelerator with recognized advantages. Among these are its efficiency as a catalyzer and its lesser cost as compared with other catalyzers of similar strength.

Activities of The Rubber Association of America.

RATES TO PACIFIC COAST PORTS AND TRANSCONTINENTAL INTERMOUNTAIN TERRITORY.

AT THE MARCH MEETING of the Traffic Committee, consideration was given to a complaint now before the Interstate Commerce Commission, with respect to a proposal of the carriers to revise rates from all territory east of the Missouri River to San Francisco, Seattle, Spokane, Nevada and Arizona points, etc., which if accomplished would result in substantial increases in rates on articles of rubber manufacture from shipping points east of Chicago, Illinois, and St. Louis, Missouri. It is felt by the Traffic Committee that this proposed revision of rates would result in disadvantages to the members of the Association who market their product at far Western points, and for this reason the Committee has presented objections to this proposed action of the carriers. The Traffic Department and the Committee's commerce attorney appeared in this case for the Association at the hearings held before the Interstate Commerce Commission in New York on May 7 and Chicago on May 10.

CASH PAYMENT OF FREIGHT CHARGES.

The Interstate Commerce Commission held a hearing in Washington in order to obtain the views of the shippers and the railroads with respect to the cash payment of freight charges, with the idea of formulating rules for the guidance of the railroads based on the revisions of the new Transportation Act, providing that the carriers shall be responsible for the collection of correct freight charges on and after July 1, 1920, with such exceptions thereto as may be permitted by the Interstate Commerce Commission.

During the period of Federal Control, the United States Railroad Administration discontinued granting limited credit that had been accorded shippers under certain conditions by the individual carriers, and required the payment of freight charges by those formerly receiving credit, within forty-eight hours after the presentation of freight bills.

The Traffic Department was represented at this hearing in Washington and presented a proposal on behalf of the rubber industry, asking that the Commission prescribe rules permitting an extension of the credit time to seven days from date of presentation of freight bills; each month to be divided into four payment periods. It is understood that this request is predicated upon the Commission requiring satisfactory guarantee being furnished the carriers by the shippers.

RUBBER ASSOCIATION BULLETIN SERVICE.

The Rubber Association of America maintains an information service through "Bulletins" for its members by which it calls their attention to matters that may concern them. During the past month bulletins have been sent out covering the following subjects that are important to the question of industrial relations: "Saving Banks Deposits in the United States"; "Expenditures of Trade Unions in the United States"; "Sharing Savings in Production with Labor"; "Report of Second Industrial Conference"; and the following report on physical examination.

THE PHYSICAL EXAMINATION IN INDUSTRY.

The Conference Board of Physicians in Industry has just completed a study of physical examinations in twenty-eight corporations who together employ over 350,000 men and women. The returns indicate quite clearly that while the physical examination in industry is comparatively new, employers and employees have recognized its value. Of the twenty-eight plants studied, physical examinations were introduced in one as early as 1900; in two others between 1900 and 1910; in six others between 1910 and 1914, and in the remaining nineteen, during or since 1914. In

only one instance, that of a textile mill employing 2,700 persons, was the physical examination discontinued. The reason given in this case was "labor conditions."

In general, employees welcome the examination. The number of those objecting was found to constitute a fraction of 1 per cent and was regarded as too small to tabulate. The reason given by employees who objected to examination invariably took one or both of two forms: "red tape" and "opposition to exposure." Employees who object to examination are frequently those who fear that such an examination will disclose some defect or a diseased condition.

In the plants studied, it was found that of all employees examined, the average number of those rejected was four in every hundred. In six plants employing women, the physical examination was made by a woman physician. In another plant, women workers could upon application have a woman physician examine them. In the other plants, women were examined by male doctors. With but five exceptions, the results of the physical examination are used as a guide in placing employees within the factory. In these five cases the examinations are made for special reasons only and are not required of all applicants. The time required by the physicians to make the examination was found to vary from three to forty minutes, the average ranging between six and ten minutes.

The benefits claimed for the physical examination in the replies received, are that they protect the employee, his fellow worker, and also the employer. Employees are not permitted to engage in an occupation in which they would be a menace to themselves, to others, or to property. Accident hazards are thereby reduced, labor turnover is reported as being lessened, and employees, on the whole, as being more satisfied.

Through the general bulletin service, rubber manufacturers were informed that Trade Commissioner Sanger has completed his report on advertising methods in Argentina, Uruguay, and Brazil, and it is now ready for distribution. Copies can be obtained for thirty cents currency by applying in person to any of the district or cooperative offices of the Bureau of Foreign and Domestic Commerce, or by addressing the Superintendent of Documents, Washington, D. C.

Copies of the "Memorandum on the Rubber Industry Prepared by the War Service Committee of the Rubber Industry of the U. S. A." and the addendum of authorities for the statements made in that memorandum were sent to all firm members of the association.

A list of export business opportunities was sent to firm and affiliated members.

EXCELSIOR RUBBER PASTE.

A new softening ingredient to assist the incorporation of ground rubber waste in rubber mixings has recently been introduced to the American rubber trade by its English manufacturers. It may be employed to the extent of ten per cent of the batch and is said not only to facilitate the mixing operation but to improve the finished material.

PROOFING FORMULA.

The following formula for a proofing mixture is proposed by Perkin and Mandelberg: caoutchouc 25 parts, dry alumina 60, asbestos powder 7, litharge 6, and sulphur 1 part.

This mixing is dissolved in naphtha and applied by a spreader. Vulcanization is effected by steam heat. (*"Le Caoutchouc et la Gutta Percha."*)

News of the American Rubber Industry.

DIVIDENDS.

THE Ajax Rubber Co., Inc., New York City, has declared its regular quarterly dividend of \$1.50 a share, payable June 15 on stock of record June 1, 1920.

The Bergougnan Rubber Corporation, Trenton, New Jersey, declared a quarterly dividend of one and three-quarters per cent, payable May 15 on preferred stock of record April 10, 1920.

The Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, has declared its regular quarterly dividend of \$3 on common stock and its semi-annual dividend of \$3 on preferred stock, both payable June 15 on stock of record June 1, 1920.

The Brunswick-Balke-Collender Co., Chicago, Illinois, declared the following dividends: stock, 200 per cent, payable May 15; quarterly, one and three-quarters per cent, payable May 15 on stock of record May 4, 1920.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has declared its quarterly dividend of one and three-quarters per cent, payable June 15 on preferred stock of record May 31, 1920.

The General Electric Co., Schenectady, New York, has declared quarterly dividends as follows: cash, two per cent, and stock, two per cent, both payable July 15 on stock of record June 10, 1920.

The Globe Rubber Tire Manufacturing Co., Trenton, New Jersey, has declared a quarterly dividend of one and one-half per cent, payable June 15 on common stock of record May 31, 1920.

The Lee Rubber & Tire Corporation, Conshohocken, Pennsylvania, has declared a quarterly dividend of fifty cents a share, payable June 1 on stock of record May 15, 1920.

The National Aniline & Chemical Co., New York City, has declared a quarterly dividend of one and three-quarters per cent, payable July 1 on preferred stock of record June 14, 1920.

The New Jersey Zinc Co., Inc., New York City, has declared a quarterly dividend of four per cent, payable May 10 on stock of record April 30; and a stock dividend of 20 per cent on its \$35,000,000 of stock outstanding, payable June 10 on stock of record May 12. Stockholders may subscribe before November 15, 1920, to \$7,000,000 of new stock at par, \$100, on the basis of one share for every five already held.

The Star Rubber Co., Akron, Ohio, declared a 100 per cent stock dividend, payable April 1, and gave to stockholders of record April 20 the right to subscribe to common stock at par up to 20 per cent of their holdings, the stock to be issued May 1.

The Victor Rubber Co., Springfield, Ohio, has declared a quarterly dividend, increased from seventy-five cents to one dollar a share, payable May 15 on common stock.

NEW INCORPORATIONS.

Astor Rubber Co., Inc., May 15, 1920 (New York), \$250,000. S. M. Cohen, H. M. Cunningham, H. L. Klein—all of 2 Rector street, New York City. To manufacture rubber goods, coats, tires, etc.

Barr Rubber Products Co., Inc., April 1, 1920 (Ohio), \$25,000. N. Barr, president and general manager; J. Horn, vice-president; W. H. Adams, secretary and treasurer—all of Lorain, Ohio. Principal office, Lorain, Ohio. To manufacture toy balloons, bathing caps, etc.

Barnett Tire & Rubber Co., Inc., May 12, 1920 (New York), \$25,000. H. C. Bartoo, L. C. Olden, both of Eden; A. L. Endres, 94 Grant street, Buffalo—both in New York. Principal office, Buffalo, New York. To manufacture tires, etc.

Res-Yet Tire Service Co., Inc., The, April 30, 1920 (New York), \$10,000. R. C. Kull, L. N. Daymont, both of New York Mills; J. N. Daymont, secretary and treasurer—all of New York. Principal office, Utica, New York. To repair tires.

Coast Tire & Rubber Co., August 29, 1919 (California), \$50,000. H.

Inc., president; J. I. Bankatz, vice-president; N. B. Campbell, treasurer; W. D. Toole, secretary; E. Lawhorn, superintendent. Principal office, 408 Syndicate Building, Oakland, California. To make, repair tires and tubes.

Elasto Textile Co., March 30, 1920 (New York), \$15,000. H. Stott, C. E. Jones, J. P. Healey—all of Cohoes, New York. Principal office, Cohoes, New York.

Enterprise Vulcanizing Co., April 15, 1920 (New York), \$10,000. A. M. Herman, C. H. Paulsen, all of 402 Dean street, Brooklyn, New York and Principal office, Brooklyn, New York.

Eveready Tire Co., April 23, 1920 (Delaware), \$100,000. W. S. Gault, St. Louis; B. N. Morris, Kansas City—both in Missouri; W. O. Young, Wagstaff, Kansas. To manufacture and sell rubber tires and inner tubes, etc.

Fort Pitt Rubber Products Co., March 23, 1920 (Delaware), \$100,000. I. A. Irwin, M. L. Rogers, W. G. Singer—all of Wilmington, Delaware. To manufacture and deal in rubber and its by products.

Gillette Tire & Rubber Co., March 30, 1920 (Delaware), \$20,000. R. K. Thistle, A. R. Meyers, R. J. Gorman—all of New York. To manufacture tires.

Glendening Asbestos & Rubber Corp., May 8, 1920 (New York), \$110,000. W. J. Glendening, 1067 Altona Road, Brooklyn; S. J. Lieneckind, Pelham; L. D. Kimbal, 243 West 21st street, New York City—all in New York. To manufacture rubber and asbestos products.

Hale & Co., R. H., March 3, 1920 (New York), \$15,000. R. H. Hale, L. S. Hamerly. Principal office, 1947 Broadway, New York City. To deal in tires.

Hudson Tire & Rubber Co. of Pittsburgh, May 6, 1920 (Delaware), \$1,000,000. B. H. Resnick, S. Goltz, J. Gusk—all of Pittsburgh, Pennsylvania.

Ideal Tire & Supply Co., March 30, 1920 (New Jersey), \$50,000. A. W. Combs, 470 Norwood street; T. F. McHugh, 465 Norwood street, both of East Orange; F. Stiers, 329 Essex avenue; P. D. Jones, 9 Lenox avenue, both of Newark—both in New Jersey. Principal office, 192 Market street, Newark, New Jersey. Agent in charge, F. Forlino. To manufacture, buy, sell, and generally deal in tires, etc.

Indiana Rubber & Tire Co., Inc., May 4, 1920 (New York), \$10,000. J. Eisner, 1800 Seventh avenue; J. Decher, 970 Eighth avenue, both of New York City; I. Weissman, 134 Alabama avenue, Brooklyn—both in New York. To manufacture tires.

Larson, Jr., Corp., L. P., April 9, 1920 (Delaware), \$5,500,000. T. L. Croteau, M. A. Bruce, S. E. Dill—all of Wilmington, Delaware. To manufacture paper, rubber, etc.

Lima Rubber Tire Co., February 18, 1920 (Ohio), \$200,000. (On April 28, 1920, the name of this concern was changed to The Lima Rubber & Heel Co.) J. E. Groszner, president; F. L. Maire, vice-president; F. E. Harman, secretary; F. W. Cook, treasurer. Principal office, 447 North Elizabeth street, Lima, Ohio. To manufacture Gro-Cord rubber soles and heels.

Lynch Safety Pneumatic Automatic Tire Corp., April 21, 1920 (New York), \$60,000. J. B. Lynch, W. B. Shaul, H. E. Waite—all of Syracuse, New York.

McPhillips & Co., Inc., C. F., May 13, 1920 (New York), \$5,000. C. F. McPhillips, D. R. Baldwin, W. T. Hall—all of 27 Pine street, New York City. To deal in rubber.

Muller Tire & Rubber Co., Inc., The, May 5, 1920 (New York), \$25,000. W. H. Muller, 128 West 19th street; H. J. Vendorf, 163 West 77th street; A. F. Tompkins, 1210 Boynton street, Bronx—all of New York City. To distribute tires, etc.

Ohio State Rubber Tire Co. of New York, Inc., May 11, 1920 (New York), \$100,000. R. S. Ireland, 690 St. Nicholas avenue, New York City; R. L. DeLisser, Great Neck; E. O. Machin, New Rochelle—all in New York. To manufacture and deal in tires.

Palladium & Rubber Co., March 24, 1920 (Delaware), \$375,000. T. L. Croteau, M. A. Bruce, S. E. Dill—all of Wilmington, Delaware. To manufacture tires.

Parker Collapsible Rim Sales Co., April 20, 1920 (Delaware), \$1,100,000. B. K. Thistle, 65 Cedar street, A. R. Myers, R. J. Gorman—all of New York.

Phoenix Tire Mold Co., May 3, 1920 (Delaware), \$300,000. M. L. Harty, M. C. Kelly, S. L. Mackey—all of Wilmington, Delaware.

Prudential Rubber Tire & Fabric Corp., March 23, 1920 (Delaware), \$27,500,000. T. L. Croteau, M. A. Bruce, S. E. Dill—all of Wilmington, Delaware.

Rohde Products Corp., May 19, 1920 (New York), \$500,000. F. L. Lenthal, 1150 Broadway; R. M. Neuberger, 215 West 88th street; L. Lech, 1475 Broadway—all of New York City. To manufacture tires and auto equipment.

Self-Propelling Nozzle Co., Inc., April 7, 1920 (New York), \$25,000. S. Sladden, president; H. S. Ashmun, vice-president; R. H. Ashmun, secretary. Principal office, 233 Broadway, New York City. To manufacture and sell the "Victory" self-propelling nozzle. (See THE INDIA RUBBER WORLD, September 1, 1919, page 702.)

Simpson Rubber Products Corp., April 26, 1920 (New York), \$25,000. N. Ballin, 1855 88th street; H. E. Munich, 1462 Bushwick avenue, both of Brooklyn; L. Zimmerman, 68 Lewis street, New York City—both in New York. To manufacture rubber, chicle, gum, etc.

Sunco, Inc., May 4, 1920 (New York), \$1,000. N. Ballin, 1855 88th street; H. E. Munich, 1462 Bushwick avenue, both of Brooklyn; L. Zimmerman, 68 Lewis street, New York City—both in New York. To conduct shoe business.

Synthetic Rubber Products Co., April 9, 1920 (Delaware), \$3,000,000. E. W. Lohman; A. C. Sievera, J. C. Wichman. To make tires of all kinds, and other rubber products.

Terrell Tire & Rubber Co., April 19, 1920 (Delaware), \$1,600,000. T. L. Croteau, M. A. Bruce, S. E. Dill—all of Wilmington, Delaware. To manufacture tires.

Van Woud Rubber Co., April 10, 1920 (New Jersey), \$1,500,000. F. and C. J. Pring, H. L. and A. D. Bruen—all of South Sixth and Bergen streets, Jersey City. Principal office, corner of South Sixth and Bergen streets, Harrison, New Jersey. Agent in charge, H. L. Brown. To manufacture, sell, and deal in drugs—its similar to 100-100-100 kinds, etc.

Voice Tire Exchange, Inc., May 5, 1920 (New York), \$10,000. A. Voice, Passaic, New Jersey; J. H. Metz, 312 South Broadway, Yonkers; J. A. Voice, 210 Eleventh avenue, New York City—both in New York. To manufacture and deal in tires.
 Near Best Garter & Snowener Co., April 15, 1920 (New York), \$20,000. M. Sternfeld, W. Brill, 1 M. Gluckman—all of 57 East Third street, New York City.
 Wondersal, Inc., April 23, 1920 (New York), \$500. L. H. Crough, 301 Columbus avenue; H. W. Frey, 1210 Clay avenue, both of New York City; S. R. Fleisher, 817 Avenue N., Brooklyn—both in New York. To manufacture a chemical compound for making tires puncture proof.

PERSONAL MENTION.

Walter J. Bitterlich, plant engineer for the Hood Rubber Co., Watertown, Massachusetts, for the last fourteen years, has accepted a similar position at the new plant of The Seamless Rubber Co., New Haven, Connecticut.

O. G. Hellner, formerly special Iowa representative of The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has been placed in charge of the Iowa territory of the Globe Rubber Tire Manufacturing Co., New York City.

E. B. Thompson, former special representative of the Michelin Tire Co., Milltown, New Jersey, has been placed in charge of the central Illinois territory of the Globe Rubber Tire Manufacturing Co., New York City.

D. J. T. Kennedy, formerly advertising manager of The Mason Tire & Rubber Co., Akron, Ohio, is now assistant secretary and director of advertising and sales for the new Latex Tire & Rubber Co., Fond du Lac, Wisconsin.

C. R. Collins and Lee Folger have been elected directors of the McClaren Rubber Co., Charlotte, North Carolina.

T. S. Lindsey, until recently eastern district manager of the branches of the Kelly-Springfield Tire Co., New York City, has been appointed a special representative of the sales department.

Gladding Price, for the last two years in charge of factory compounding for the Davol Rubber Co., Providence, Rhode Island, has been appointed assistant to A. A. Somerville, manager of the rubber department of R. T. Vanderbilt Co., 50 East 42d street, New York City, and began his new duties May 1. Mr. Price was formerly with The Goodyear Tire & Rubber Co., Akron, Ohio, and with the United States Rubber Co.

Charles C. Phelps has become associated with the Uehling Instrument Co., 71 Broadway, New York City, combustion engineers and manufacturers of fuel economy apparatus. He is devoting most of his time to research work in connection with the efficient combustion of fuel oil in boiler furnaces. He is a graduate of Stevens Institute of Technology and an associate member of the American Society of Mechanical Engineers.

E. A. Oldershaw has been appointed manager of sales, in charge of the waterproofing department of the Mitchell-Rand Manufacturing Co., New York City, manufacturer of electrical insulating materials. Mr. Oldershaw has been engaged in the structural compound and waterproofing business for over fifteen years.

L. Brandenburger, formerly located in the Walker Bank Building, has taken larger quarters at 59 West Broadway, Salt Lake City, Utah. He has been recently appointed sales representative of The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, for the territory including Utah, the western part of Wyoming, and three-quarters of the state of Idaho.

George B. Fink, Jr., has been appointed manager of the new rubber trades department of The Chas. R. Sargent Co., Engineers Building, Cleveland, Ohio, handling a complete line of pigments, chemicals, oils and colors, and naval stores suitable for the rubber trade.

C. E. Thompson, president, and M. L. Heminway, general manager of the Motor and Accessory Manufacturers' Association, will sail for Paris on June 5, on the *Kroonland*, to represent the Association at the meeting of the International Chamber of Commerce in Paris on June 21. They will also study the conditions of the European automobile industry.

E. B. Harral has succeeded H. C. Danaher as manager of the New Orleans office of G. Amsinck & Co., Inc., New York City.

Bertram G. Work, president of The B. F. Goodrich Co., Akron, Ohio, was one of the 1550 passengers who sailed for Europe on the *Mauretania* when she left New York City, April 24.

Dr. Frederic Danneneth has recently accepted the position of chief chemist of the C. Kenyon Co., Brooklyn, New York, in charge of the chemical laboratory of the tire department at the Bay Ridge works.

John A. Horner, former branch manager of The Fisk Rubber Co., Baltimore, Maryland, has been appointed manager of the Baltimore district with headquarters in that city. Mr. Horner

J. A. HORNER.

has been connected with The Fisk Rubber Co. since August, 1911, when he entered its employ at the Baltimore branch. In January, 1913, he was appointed salesman out of this branch and in June, 1915, was made manager of the Richmond, Virginia, branch. On January 1, 1918, Mr. Horner reported for active duty with the United States Navy, serving until January 30, 1919. He immediately reentered the employ of the Fisk company as manager of its Fort Wayne, Indiana, branch. On November 1, 1919, he returned to Baltimore as branch manager, where he has remained until the present time. Mr. Horner succeeds E. J. McLaughlin, who has been granted a leave of absence because of ill health.

C. A. Warren, formerly manager of the Fisk company's branch at Roanoke, Virginia, succeeds Mr. Horner as Baltimore branch manager.

Alfred Whiteaway and Leonard Brown, both directors of Chas. Macintosh & Co., Limited, Manchester, England, were in the United States last month and visited rubber factories in the East and the Akron district.

MEETING OF AMERICAN SOCIETY FOR TESTING MATERIALS.

The American Society for Testing Materials will hold its twenty-third annual meeting at Asbury Park, New Jersey, on June 22-25, 1920. The reports of interest to the rubber trade will be made on Thursday afternoon, June 24, when E. A. Barrier, chairman of Committee D11, will report on rubber products, J. M. Bierer will describe a test of special steam hose, and G. B. Haven, chairman of Committee D13, will report on textile materials.

THE RUBBER TRADE IN THE EAST.

By Our Regular Correspondent.

NEW YORK NOTES.

THE LEE RUBBER & TIRE CORPORATION, New York City and Conshohocken, Pennsylvania, at the annual meeting elected the following directors: H. C. Coleman, J. Carl DeLaCour, John M. Dettra, James A. Fayne, Stephen B. Fleming, Albert A. Garthwaite, Walter R. Herrick, Horace C. Jones, Samuel H. Miller, John J. Watson, Jr., and Joseph Wayne, Jr. At the organization meeting the following officers were elected: John J. Watson, Jr., president and chairman of the board; Albert A. Garthwaite, vice-president and treasurer; Henry Hopkins, Jr., secretary; W. B. Dunlap, assistant treasurer; and John M. Dettra, assistant secretary.

The Ajax Rubber Co., Inc., New York City, recently ratified an increase in the capital stock from \$10,000,000 to \$20,000,000, par value \$50 per share, to provide for future requirements of the business, but it is not planned to issue any of this newly authorized stock at the present time.

The Tropical Rubber Co., 365 Broadway, New York City, is a Delaware corporation organized November 6, 1917, with a capitalization of \$400,000, for the purpose of manufacturing and

selling automobile tires and tubes and similar articles. Since that time the certificate of incorporation has been amended and the capitalization increased to 100,000 shares, par value \$10 per share, and 100,000 shares, no par value. The officers are: George V. S. Williams, president; Henry W. Van Alen, treasurer; and F. C. Woods, secretary.

R. H. Hale & Co., 1947 Broadway, New York City, has been organized by R. H. Hale, formerly in charge of the New York City store of The B. F. Goodrich Rubber Co., to do a general business dealing in pneumatic tires of all leading makes.

William H. Stiles & Co., New York City, crude rubber brokers, have removed to No. 1 Liberty street, Rooms 1807-1809.

The Kelley Tire & Rubber Co., New Haven, Connecticut, has established its New York factory branch at 1656 Broadway, corner of 51st street, New York City.

The Firestone Tire & Rubber Co., Akron, Ohio, a West Virginia corporation, has appointed E. P. Jones its New York representative, with headquarters at 1871 Broadway, the New York City office.

A vacancy on the board of directors of the United States Rubber Co., New York City, having been caused by the decease of Theodore N. Vail, at the annual meeting of stockholders on April 20, 1920, George R. Deshler, of New Brunswick, New Jersey, was elected the twenty-fourth member. The personnel of the operating council was also elected, as follows: Charles B. Seger, chairman; Homer E. Sawyer, Elisha S. Williams, J. Newton Gunn, Ernest Hopkinson, and W. G. Parsons. The other officers elected are the same as given in THE INDIA RUBBER WORLD, May 1, 1920.

The Executive Committee of the Motor and Accessory Manufacturers' Association, New York City, at its recent meeting in Atlantic City, after a canvass of its members, adopted resolutions opposing the introduction of the metric system into American industries.

PENNSYLVANIA NOTES.

The Carlisle Tire & Rubber Co., Carlisle, Pennsylvania, is building a small addition to its factory.

The Fawcus Machine Co., Pittsburgh, Pennsylvania, has purchased an interest in The Schaffer Engineering & Equipment Co., of which the new officers are: A. F. Cooke, president and general manager; J. C. Schaffer and Eliot A. Kebler, vice-presidents; A. A. Alles, Jr., treasurer; and Waller Crow, secretary.

CONNECTICUT NOTES.

The Goodyear Rubber Company, Middletown, Connecticut, will build a three-story plant, 50 by 216 feet, to cost about \$144,000.

The Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, has recently let a contract for the building of fifty-four new houses for employees, located on what is known as the "hill." These will be sold on easy terms and are a part of the general plan of the town which the company hopes to make one of the most beautiful in the Naugatuck valley. Forty houses were built four years ago by the company in this same locality and were promptly bought by employees.

The Farrel Foundry & Machine Co., Ansonia, Connecticut, has recently authorized an issue of \$1,500,000 preferred stock, of which \$1,200,000 has been sold. The common stock of this company has stood at \$1,200,000 for a number of years.

THE SEAMLESS RUBBER COMPANY.

THE SEAMLESS RUBBER COMPANY, INC., will soon move from the quarters it has occupied for over forty years into the new \$3,000,000 factory it has built on the New Haven waterfront. The business was started in the early seventies of the last century by Charles E. Longden, a young man who had a japanning shop in Naugatuck, Connecticut. An Englishman named Collins interested him in rubber, and the two, finding water power on Longden's farm, began making seamless nipples, sewing machine rings and hollow rubber balls. Having formed a partnership with George Hine, the firm of Hine & Longden started a factory in the town of Naugatuck in 1875 and moved to New Haven two years later, when The Seamless Rubber Company was incorporated with \$50,000 capital.

About the time that the United States Rubber Company was being formed, Joseph Banigan became interested in the Seamless company and became president in 1893. Three years later the control passed to George A. Alden and George M. Allerton, the former continuing as president till his death in 1904. Mr. Longden remained as superintendent till 1901. In 1917 the company came into the hands of the present management, and the officers are: F. O. Williams, president; F. W. Dodge, vice-president; W. C. Hutton, treasurer; H. W. Gordon, secretary, and J. W. Patterson, superintendent.

The present plant at Congress avenue and Daggett street, repeatedly enlarged with the company's progress, will be sold.

NEW PLANT OF THE SEAMLESS RUBBER COMPANY, INC., NEW HAVEN, CONNECTICUT.

The new plant is on the waterfront, with the New Haven harbor on one side and the New Haven railroad on the other, thereby securing direct shipment by both water and rail. The plant consists of three five-story buildings connected by one-story buildings, covering an area of 240 by 300 feet; thus providing seventeen floors above ground, 14,400 square feet to each floor, without counting basements and sub-basements. A separate power plant furnishes steam for vulcanizing as well as power, heat and light. The buildings are of concrete, steel and glass; they are fireproof, light and airy. Every piece of machinery and equipment is new and made to order and every modern method known to the rubber industry will be used. The comfort and welfare of the employees, who will number 1,500 in the new plants, have been fully considered as a roof-garden enclosed in glass, will contain a dining room, a dance hall and an auditorium.

The specialty of the Seamless company from the beginning had been medical rubber goods, and the new factory will manufacture soft and hard rubber druggists' sundries, medical and surgical goods, household goods, medicated plasters, hard rubber combs, syringes and specialties; tennis, hand, and squash balls, football bladders and other sporting goods; rubber toys, balloons and novelties; tubings for all purposes; hard and soft rubber goods for the manufacturing and assembling trades; gloves for acid, tanners, surgical, electricians' and general factory work; acid aprons, etc. The factory is the largest in the world for this class of goods and should be in operation July 1.

The Seamless Rubber Co. does a yearly business approaching \$2,000,000, and makes goods for the United Drug Co., the Liggett stores, and other drug stores throughout the country.

CANADIAN NOTES.

On April 29, 1920, the directors of Ames Holden McCready Limited, Montreal, Quebec, authorized the incorporation of the Ames Holden McCready Rubber Boot Co., Limited, capitalized at \$3,000,000. Light, smart fitting rubbers and rubber-soled canvas shoes will be made at the Mount Royal plant, adjoining the Ames Holden leather footwear plant, and the new factory will feature rubber boots for fishermen, farmers, sportsmen, and miners, as well as overshoes and heavy work rubbers known as lumbermen's. The Mount Royal plant is increasing its daily output to supplement next fall's lines.

The Regal Tire & Rubber Co., Limited, Sherbrooke, Quebec, has purchased an industrial and factory site in that city and is remodeling the building to meet its requirements. It is also purchasing machinery and equipments, the larger contracts for which have already been placed. The company is capitalized at \$750,000, half of which is preferred and half common. Robert W. Hogg is secretary and treasurer.

The Tiger Tire & Rubber Company, Limited, 1105 Temple Building, Toronto, Ontario, has purchased the plant and equipment of the Belleville Rubber Co. at Belleville, Ontario, and added enough more equipment to enable it to manufacture 1,000 tires and tubes daily. It expects to begin manufacturing at once. The officers are: R. J. Graham, president, and Colonel L. W. Marsh, vice-president. The directors include, besides, Frank D. Law and W. A. Seward, general manager and consulting engineer, respectively, of the Oak Tire Co., Toronto. H. H. Hastings is manager. The company is capitalized at \$2,000,000, of which \$750,000 is eight per cent preferred stock and \$1,250,000 common.

The Canadian General Electric Co., Limited, Toronto, Ontario, is making extensive additions to its plant at Peterboro, Ontario, including one to the rubber department building, 60 by 100 feet.

Scheuer, Normandin & Co., 18 St. Helen street, Montreal, Quebec, are Canadian distributors for the sporting footwear of the Hood Rubber Co., Watertown, Massachusetts, U. S. A.

The second annual convention of The National Shoe Retailers' Association of Canada and Shoe, Leather and Allied Trades Fair will be held in Montreal, Quebec, July 13-15, 1920. The following are in charge: P. A. Doig, general management; Frank Knowlton, space allotment committee; H. Gibbins, billposting; R. W. Ashcroft, publicity; and George G. Gales, entertainment.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

NEWARK NOTES.

THE B. F. GOODRICH RUBBER Co. has leased the three-story and basement building at 13-15 Franklin street, Newark, New Jersey, for branch offices. The building is 53 by 100 feet and has 20,000 square feet of floor space. The first floor will be used as a show room.

Charles Frankel, of Newark, has been appointed receiver for the Ideal Wheel & Tire Co., 148 Sussex avenue, Newark, New Jersey. The receiver will continue the business and effect a reorganization. Application for a receiver was made by Marcus Robbins, holder of fifty shares of stock. Testimony showed that the company lost \$12,000 in six months in the conduct of the business. The company's assets exceed its liabilities by a goodly margin.

The hearing on the rule to show cause why an involuntary bankruptcy petition should not be granted in the case of the Indian Tire & Rubber Co., New Brunswick, which was scheduled to be held in the United States District Court at Newark, New Jersey, on May 18, has been postponed indefinitely. In the Chancery Court proceedings in the same case a rule to show cause why an offer of \$40,000 from Otto C. Meyer, of Newark, for all the property and assets of the company should not be accepted, is returnable shortly before Vice-Chancellor Foster at Newark.

TRENTON NOTES.

The United Tire Stores Co., of Trenton, has been incorporated under the laws of the state of New Jersey with a capital of \$500,000. The company will operate a number of chain stores for the sale of tires and automobile accessories, and will take over the Fineburg Auto Tire Agency and the United Tire Co., both of Trenton, and the stores of the United Tire Co. in New Brunswick, New Jersey; Buffalo, New York; and Scranton, Allentown and Pottsville, Pennsylvania. The incorporators are Isaac Fineburg, Herman Fineburg, Samuel Fineburg and Albert F. Jemison. The principal office of the company is at 10 and 12 East Hanover street, Trenton, with Herman Fineburg in charge.

Earl R. Moore, aged 25 years, cashier of the Acme Rubber Co., Trenton, died recently after a long illness. He is survived by his widow and one son. The interment was in Rigelsville, Pennsylvania.

The Ajax Rubber Co. has purchased the entire plant and premises of the McFarland Foundry & Machine Co., situated at Mead street and Breunig avenue, East Trenton, directly opposite the Ajax works. The property consists of several factory buildings and 55,000 square feet of land. The rubber company recently erected a large addition on one side of Breunig avenue and the present purchase will place it among the largest rubber concerns in this section.

The Trenton rubber companies responded liberally to the drive conducted by the Trenton Welfare Association. General C. Edward Murray, of the Empire Rubber & Tire Corporation, W. J. B. Stokes, of the Thermoid Rubber Co., and George R. Cook, of the Acme Rubber Manufacturing Co., each gave \$1,000; the Bergougnan Rubber Corporation and the Home Rubber Co. gave \$500 each; the Essex Rubber Co. and Whitehead Brothers

Rubber Co. gave \$250 each; the Acme, Hamilton, Luzerne and United & Globe companies gave \$200 each, while the Sanhican Rubber Co. and the Woven Steel Hose & Rubber Co. contributed \$100 each.

The Pocono Rubber Cloth Co., which recently purchased the plant of the Howard Demountable Rim Co., along the main line of the Pennsylvania Railroad at Trenton, is having erected one of the largest tire signs in the country. The Bergougnan Tire & Rubber Co., situated near the Pocono works, is also having a similar sign erected.

The Bergougnan Rubber Corporation, Trenton, has commenced work on an additional factory unit and a large warehouse for storing raw materials and finished products. Improvements will also be made in the interior arrangement of the present model plant to facilitate economy in manufacture.

The Thermoid Rubber Co., Trenton, announces that its capital stock will be increased from \$1,650,000 to \$5,000,000 so that the company may increase its plant and expand its business. The company is now building a \$500,000 addition to the works on Whitehead's road, to be completed by early fall. It is one unit of what will eventually be an entirely new factory for the concern in which brake linings and other products will be manufactured. W. J. B. Stokes, J. Oliver Stokes, Robert J. Stokes and Fred Wilson are the owners of the Thermoid company.

MISCELLANEOUS NEW JERSEY NOTES.

The Cooper-Hewitt Electric Co. of Hoboken, New Jersey, which was amalgamated with the General Electric Co. last year, has bought land adjoining its plant, which will more than double its floor space. Business has more than doubled.

Hermann Weber, scrap rubber dealer, representing J. Schnurm, Tottenham, England, has combined his offices, formerly at 30 Church street, New York City, with his warehouse at Newark and Jackson streets, Hoboken, New Jersey, where all correspondence should be addressed in future.

The Reliance Tire & Rubber Co., Keyport, New Jersey, has appointed A. H. McIntyre sales manager.

The Ajax Rubber Company, Trenton, has just begun the construction of a four-story brick addition to the plant to cost \$60,000. It is at North Olden and Breunig avenues, and will be 60 by 100 feet. The ground floor will be used for offices and the upper floors as a welfare department for the employees. There will be an assembly room for the men and also a cafeteria. Part of the structure will also be used as a store-room for finished goods awaiting shipment. The firm now employs 1,000 hands and will have employment for many more when the plant is finished.

The pensioned employees of the United States Rubber Co. held a reunion recently as guests of the company in the recreation hall of the New Jersey factory at New Brunswick. The chief features of the occasion were a tour of the plant, a musical program and a supper. Addresses were made by Seymour Hada-way and A. T. Hopkins, of the Central Service Department of the company.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

GENERAL CONDITIONS in Rhode Island rubber manufacturing circles have remained practically unchanged during the last few weeks, all the concerns having good orders ahead and capacity operations being reported. The easing up of the transportation situation has caused the manufacturers less worry during the past month about their supplies of fuel and raw materials.

Wages of the operatives in the rubber factories of the state continue to be a serious problem with the management of the various plants, and not withstanding the fact that the present

schedules are more than double the scale ever paid previously, the tendency is still upward with apparently "no limit but the sky" in the estimation of the employees. How much longer this is going to keep the manufacturers on nettles and the workmen unsettled, it is difficult to foretell.

Early in May new schedules went into effect at several of the subsidiary plants of the United States Rubber Co., including the National India Rubber Co. at Bristol, with its 4,500 employees, and the Alice Mill of the Woonsocket Rubber Co. at Woonsocket and the Millville Mill of the same concern, at Millville, having 1,600 and 600 employees, respectively. In this adjustment particular consideration was given to the earnings of employees whose wages were lower than the average, it was stated. This increase, which is the second that has been granted by the corporation in the past six months, adds a considerable amount to the yearly payroll.

Following immediately upon the announcement of this increase in wages came an announcement that the employees of the National plant at Bristol and the two plants of the Woonsocket Rubber Co. will receive a week's vacation without loss of pay this summer. This action, it was stated, was taken as a part of a plan to give, if possible, all employees continuous employment during the entire year. In the past the plants have closed down about two weeks every summer and the employees have received no pay during such periods of idleness. According to the present plans the plants referred to will close July 31 and reopen August 9. Pay for the week's vacation will be given to the workers in the first pay envelope received in August after the vacation period.

One of the outgrowths of the automobile industry is the demand for textile productions for use in the manufacture of tire fabrics. The rapid growth of this branch of the textile industry of this State is plainly indicated by the great expansion that is constantly being made by the corporations engaged in this line of production. Not only are large additions being erected to the cotton manufacturing plants in all sections of Rhode Island, but substantial increases are being made to the capitalization of the concerns. One of the most noticeable of these is the Jenckes Spinning Co. of Pawtucket, which is not only expanding its plant to several times its capacity of a few years ago, but has increased its capitalization from \$3,000,000 to \$20,000,000. This increase makes the Jenckes Spinning Co. the largest capitalized corporation in Rhode Island engaged in any line of industry. The corporation has now issued common stock to the amount of \$2,000,000 and preferred stock to the amount of \$4,500,000, leaving a balance of \$13,500,000 for later issuance.

Notwithstanding the great expansions that are being made by the textile concerns engaged in fabric production for tire purposes, the production is said to be far from adequate to meet the increasing demands. The shortage in the supply of long staple cotton and the lack of spinning capacity is directly responsible for the present price of tire fabrics. The cotton mills have not been able to keep pace with the tire industry, due to the lack of loom manufacturing during the war and to the unsettled conditions of labor in the cotton centers. Not only were there no looms built during the war but the manufacture of a single loom requires at least a year. The first of these manufactured since the armistice have just come into production and these new ones are relieving those looms worn out by the constant strain of the past fifteen months, which were the heaviest in history. It will be months before the spinning capacity of the mills will be equal to the demand for tire fabrics.

The premises of the Mount Hope Spinning Co., at Warren, Rhode Island, have been the scene of great activity during the last month or six weeks, because of the extensive alterations and additions, as well as other improvements to the plant that are now under way. Although a new mill was finished last summer and another is now approaching completion, the company is

planning another addition to be constructed immediately. This latest addition to the new structure erected last summer in the rear of the original plant will be 70 feet in length and 40 feet wide, two stories high and will connect the new mill now being completed with last summer's annex to the old plant.

The National India Rubber Co., at Bristol, Rhode Island, is steadily shifting its power plant from coal to oil burning, 12 of its 15 large steam boilers having already been so changed. There are, however, five more of the boilers to be connected with the oil supply tank before the whole of the boiler department of the company's plant is fitted for burning oil for fuel purposes. This company is considering the practicability of establishing a branch of its factory at Newport, and a building on Thames street which would be available for the purpose was inspected recently by Mr. Pollock of the National Co.

Several changes have recently occurred among the department heads at the National India Rubber Co., Bristol, Rhode Island, Charles R. Caldwell, foreman of the printing department, has recently resigned and been succeeded by Samuel Simpson.

Harlowe S. Waite has been elected a vice-president and director of the Revere Rubber Co., Providence, in recognition of his many years of faithful and efficient service as factory manager.

The Davol Rubber Co.'s business continues to increase in volume and already the plant has been expanded until all the space available at the present site in Providence has been occupied. The company has recently secured the Simmons building and is to occupy this entire structure as soon as it is vacated and alterations can be made to meet the company's requirements.

The Alice Mill Employees' Association has turned over to the trustees of the Woonsocket Hospital \$154.53, the net proceeds of the recent ball given by that association for the benefit of the hospital.

DAVOL SALES AND ADVERTISING MANAGER.

RAYMOND J. FRIES, sales and advertising manager and a member of the executive council of the Davol Rubber Co., Providence, Rhode Island, was born in Trenton, New Jersey, in 1876. After attending the grammar schools and graduating from the high school in New Rochelle, New York, in 1894, he entered the employment of the Kearney & Foot Co., file manufacturers, as stock clerk. Later he became superintendent of the Foot Manufacturing Co., maker of polishing supplies, and then organized the New York Buff Co.

It was in 1905 that Mr. Fries first became connected with the rubber industry as stock clerk in the New York City store of The B. F. Goodrich Co., later being promoted to sundries salesman in New York. In 1907, upon the death of H. L. Doherty he went

to the Davol Rubber Co. as salesman, and later managed the New York City office of the company until 1917, when he moved to Providence as advertising manager, and was made sales and advertising manager in 1919.

Mr. Fries designed and planned the now well-known line of "Superservice" goods of the Davol company, and made the first use in the sundries trade of the folding or knock-down package for flat goods, now almost universally used.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

BOSTON NOTES.

TIRE ADJUSTERS from all over New England, representing The B. F. Goodrich Rubber Co., met at the Copley Square Hotel, Boston, recently and discussed methods of standardizing tire adjustments. Frank G. Harrison, Jr., district manager of sales service presided, and devoted much of the morning to instruction. Fred T. Moore, district manager, also spoke. In the afternoon the convention adjourned to the Exeter Theatre, where the delegates viewed "Striking Tires," an amusing cartoon motion picture recently released by the Goodrich company in the interest of tire conservation.

The week of May 17 was observed as "ship by truck" week all over the country. With bands playing and motors chugging, a caravan of nearly fifty motor trucks, including army and navy contingents, made a three-days' run from Boston which covered about 170 miles. The object was to bring to the attention of business men the value of shipping goods by motor truck, particularly in these days when our transportation systems are so badly tied up. The route included Cambridge, Somerville, Chelsea, Revere, Lynn, Salem, Haverhill, Lawrence, Lowell, Worcester and back to Boston. The caravan attracted much attention along the route, especially in the cities visited, where stops were made for addresses of welcome by city officials and talks on the value of motor trucks by some of those on the tour. H. H. Davis, of the Firestone Tire & Rubber Co., was in charge of the tour.

During the recent freight embargo due to striking railroad operatives, the United States Tire Co. and several other rubber firms sent trucks over the road to their factories for tires in order to supply the demands of the Massachusetts territory.

Robert C. Freeman, for several years manager of truck tire sales in the New England district for The B. F. Goodrich Rubber Co., now heads his own concern, the Goodrich Tire Service Co., 66 Broadway, Boston, which is a distributing agency for Goodrich solid and pneumatic truck tires and Diamond pneumatic tires. He has associated with him Nathaniel A. Finkelstein, also an experienced truck tire man, having successfully distributed Goodrich tires in Boston under the firm name of the Commercial Tire Service Co., at 118 Dover street.

V. J. Mulherin, 825 Boylston street, Boston, is New England distributor for Howe tires and tubes.

Guy D. Niles, formerly Boston representative for the Portage Rubber Co. and the Gillette Tire Co., has been appointed manager of the Boston branch of the Lee Rubber & Tire Corporation by Harry E. Field, vice-president and general manager of the latter company. When Mr. Field was vice-president and sales manager of the Hartford Rubber Works Co., ten years ago, Mr. Niles was beginning his career as a tire salesman for that company. A. H. Robinson succeeds Mr. Niles as manager of the Gillette branch.

A. H. McIntyre has resigned as Boston manager of the Fulton Truck Co. to become sales manager of the Reliance Tire & Rubber Co., Keyport, New Jersey. Mr. McIntyre is secretary of the Bay State Automobile Association and one of the best known automobile men in New England. This is the second time within a few months that a rubber company has selected the secretary of this association for a responsible position, his predecessor, W. O. Durrell, having joined the Goodyear forces at Akron a short time ago.

Ellsworth E. Leach, manager of mechanical sales of The B. F. Goodrich Rubber Co., Boston, on May 1, rounded out twenty years of loyal and faithful service and the sales force and department managers of the company remembered the anniversary

RAYMOND J. FRIES.

by giving a dinner in his honor and presenting him with twenty \$20-gold-pieces, one piece for each year of service. Mr. Leach has a very wide acquaintance in the trade among buyers of rubber goods and he has played an important part in guiding the destinies of the Goodrich company in this part of the United States.

The R. W. Harris Tire & Rubber Co., 737 Boylston street, Boston, is agent for Oldfield cord tires in this territory.

V. J. Mulherin, of the Howe Rubber Co., 825 Boylston street, Boston, is in charge of the New England distribution of Howe tires and tubes.

MISCELLANEOUS MASSACHUSETTS NOTES.

The Boston Woven Hose & Rubber Co., Cambridge, has received from the United States Government a distinguished service citation and certificate of merit for its services during the war. In congratulating the employees on the important part played by them in this matter the management emphasizes the importance of continuing the same initiative, energy and industrial productivity in times of peace.

The Boston Woven Hose & Rubber Co., Cambridge, is establishing a self-service cafeteria with a seating capacity of 250 for its employees. A good variety of wholesome food, drinks, smokes and ice cream will be sold without profit.

With eyes open to the gravity of the food situation, the officials of the Monaquot Rubber Works Co., South Braintree, Massachusetts, have this year placed at the disposal of their employees a good-sized tract of the company's land for gardening purposes. As much interest is being shown in "peace" gardens as was evinced in "war" gardens when America first entered the great conflict. The spirit of rivalry is being encouraged and it is expected that the present enthusiasm will be maintained through the harvest season.

The second "get-together dinner" of the employees of the Tyer Rubber Co. was held at the November Club House, Andover, Massachusetts, on the evening of April 20. The seventy-five employees present were all of the delegates and alternates of the Tyrian Service Committee, the representative committee of the employees; all of the foremen, and the committee members of the management. During the dinner a musical program of songs and orchestral selections was rendered by the Tyrian Mixed Quartette, by soloists from among the membership, and by the Tyer Rubber Company orchestra. Following the dinner, informal remarks were made by several members of the committee, and Mr. Jones, the treasurer and general manager, paid a tribute to Mr. Carlton, the late purchasing agent of the company.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

AKRON NOTES.

THE POPULATION of Akron, the rubber center of the world, has been announced as 208,435 persons, as compared with a population of 69,000 persons ten years ago. This is an increase of 208.1 per cent.

The history of the growth of the city of Akron into the "larger city" class is the history of the rubber industry. For although the city had three sound and growing industries when the automobile industry opened a new field for the rubber products then made in a small way in the city, it was the tire industry which made possible the expansion of the industry which in turn made the city what it is today.

The city grew, however, because it had industrial leaders who were ready to take advantage of the situation. As was pointed out in THE INDIA RUBBER WORLD several months ago, Akron has few natural advantages which should make it the center of the rubber world.

When Dr. B. F. Goodrich came to Akron in 1869, after having failed to organize the rubber industry in the East, the

business men of Akron were ready to take a chance and backed him with sufficient capital to erect a 40 by 100-foot shop, in which he began the manufacture of rubber goods.

Although the succeeding years were hard ones, the men who backed him did not lose faith, and when the bicycle wave swept over the country these same and other men were ready to advance a greater capital to make it possible to furnish tires for the bicycles.

When the bicycle tire demand had been met by the rubber industry and no further fields seemed available, came the invention of the automobile and the necessity for rubber tires of larger sizes, and again the business men of the city backed the increased plants and the rubber industry of the city set the pace in the manufacturing of automobile tires. In every instance it was a case of men having faith in their own judgment of the future and being ready to back their judgment with their money.

At the present time the capitalization of the 22 rubber plants in Akron is placed at \$227,119,275 by the Chamber of Commerce in official publications, the number of men and women employed in the industry at approximately 75,000, manufacturing \$427,796,317 worth of goods a year and having a pay-roll of \$101,178,591 a year.

In the history of the development of the city the names of Goodrich, Seiberling, Firestone, Work and Gammeter stand out. The rubber industry is so young that the men who were instrumental in founding the business are still at the helm at the period of its larger expansion.

The future of Akron appears as bright as it did five and ten years ago. Men familiar with its history and prospects do not hesitate to place the ultimate population at 500,000 with the same confidence with which they placed it at 200,000 by 1920 two and three years ago.

The war brought to Akron the beginning of what is considered by rubber men as the next great industry—dirigibles and airplanes.

The manner in which Akron men have taken to the new industry is similar to the manner in which they grasped former opportunities, and if the industry develops as anticipated it will be found in ten years that Akron will be one of the centers of aviation.

A flying club having approximately two hundred members has been organized in the city and efforts will be made to increase this membership. The club is being fostered by the large manufacturers, and a local company has given enough land for a hangar near the city.

John Gammeter, one of Akron's pioneer bird men and head of the experimental department of The B. F. Goodrich Co., is one of the leaders in the new club. Mr. Gammeter was recently elected president of the flying clubs of the state of Ohio at a convention held at Columbus.

The B. F. Goodrich Co. has taken out a building permit for a factory building to cost approximately \$400,000. The company now has more than \$1,000,000 worth of building under way.

C. D. Studebaker has been appointed district sales manager of The B. F. Goodrich Co. for the Akron territory, which includes Cleveland, Youngstown, Erie and Pittsburgh. Mr. Studebaker started with the company as a New York salesman.

Only six persons wear the Goodrich 25-year service pins. Of the 157 pioneers, 126 wear the 10-year service pin and 26 the 15-year service pin.

The Miller Tire & Rubber Co., Akron, will continue its Americanization classes until the middle of June. Mrs. Louise F. Copp has been appointed plant director of the work in this department and five employees of the company recently received certificates showing that they had completed 75 or

more hours of class work during the last term. Two diplomas have also been awarded to employees.

Edward S. Schlegel, of Youngstown, formerly with the Ohio Industrial Commission, has been named safety manager of The Miller Rubber Co., Akron.

Theodore E. Smith, publisher of "The India Rubber Review," has been elected president of the Rotary Club for the ensuing year.

Major A. G. Stevens, formerly in the highway transportation service of the Council of National Defense, has been made head of the highway transport division of the Goodrich Travel and

Transport Bureau, Akron, Ohio, of which Raymond Beck is chief.

MAJOR A. G. STEVENS.

Before entering government service Major Stevens was engaged in railroad tariff compilation and, therefore, he was placed in charge of the section of the finance division of the War Department which issued railroad freight charges. After the war he was assigned to the Council of National Defense to make a comprehensive survey of highway transportation throughout the country. He compiled data showing the comparison between railway, waterway, and highway rates, and obtained reports relating to

motor express development and operating costs.

In his present work Major Stevens will correlate all available information on highway transportation, make analyses of engineering features of motor trucking, and issue bulletins containing a digest of all matters of interest.

In order to supply fabric for local rubber mills approximately 500 trucks were hired in the East by Akron rubber factories to bring it over the road from eastern mills. One train, guarded by armed men, brought in 40 cars of fabric. The trucks made the trip at the rate of 100 miles a day and were paid at the rate of \$1 a mile.

The Goodyear Tire & Rubber Co. has announced that the factory will work only five days a week because it is impossible to make shipments, due to the railroad situation created by the switchmen's strike.

The Goodyear Tire & Rubber Co. has made an arrangement with the federal postal authorities whereby the Government will move the East Akron post office into a building to be constructed at a cost of \$250,000 by the Goodyear company. The building will have 7,000 feet of floor space.

The Goodyear engineering department will soon move into a new five-story building which is now being completed.

Fred Fuller, assistant manager of the labor department of The Goodyear Tire & Rubber Co., was given a desk chair by Goodyear "silents" before he started to Los Angeles to work in the Goodyear plant there. The division heads of the labor department presented him with a loving cup at a dinner tendered him at the City Club recently.

During the third week of May a "ship by truck" tour was conducted by the Firestone Tire & Rubber Co. to the smaller cities and towns near Akron. It was part of the national movement to further the "Ship by Truck Movement."

Although no definite figures are available, safety managers of the various rubber factories here state that accidents were reduced at least 50 per cent during the safety campaign conducted by Akron industries during the week of May 2-9. All the large factories conducted separate campaigns in their plants.

The fact that rubber overshoes and rubbers cannot at present be purchased in Akron retail shoe stores, when they

are located in the rubber goods center of the world, is considered as a huge joke.

At the annual meeting of stockholders of The B. F. Goodrich Company, Akron, held March 15, 1920, the following six directors were elected for a term of three years: D. M. Goodrich, New York City; H. Hough, Akron; C. B. Raymond, Akron; H. E. Raymond, New York City; E. C. Shaw, Akron, and F. C. Van Cleef, Akron.

The by-laws were also amended, changing the time of holding the annual meeting of the stockholders from the second Wednesday of March to the third Wednesday of April, beginning in 1921.

At the organization meeting of the directors held immediately after the stockholders' annual meeting on March 15, the following officers were elected for a term of one year: B. G. Work, president and chairman of board of directors; H. E. Raymond, vice-chairman of board of directors; vice-presidents—C. B. Raymond, W. A. Means, H. K. Raymond, W. O. Rutherford, A. B. Jones and W. C. Geer; F. C. Van Cleef, secretary; L. D. Brown, treasurer and assistant secretary; H. Hough, comptroller; H. C. Miller, director, tire sales; C. E. Cook, director, mechanical sales; W. C. Arthur, assistant secretary; V. I. Montenyohl, assistant treasurer, and L. L. Smith, assistant treasurer.

MISCELLANEOUS OHIO NOTES.

W. R. McCarty, who recently assumed the duties of sales manager for The Standard Tire Co., Willoughby, Ohio, maker of "Tiger-Foot" cord tires, has been connected with

W. R. McCARTY.

several of the large tire companies. For a number of years he served as branch manager for such well-known organizations as the Firestone Tire & Rubber Co., The Rubber Products Co. and The Portage Rubber Co. His activities have always been confined to sales, and he is widely known in the trade as an organizer and executive.

Sales of the Mason Tire & Rubber Co., Kent, Ohio, amounted to \$1,067,000 during the first three months of 1920. The Mason fabric mill was scheduled to begin operations on May 15.

The Mason Tire & Rubber Co., Kent, Ohio, is making extensive plans for housing the increased number of employees due to the extension of the tire plant and the starting of the cotton fabric mills. One of the plans calls for a group of three units facing a court which will have a fountain, flower beds, trees and shrubbery. There will be twenty-three five-room suites of the duplex type, each being planned to accommodate six or eight girls or a family of four or five. A community hall will give opportunity for social events. The construction is brick, tile and stucco, and the buildings will be heated from a central plant.

The Barr Rubber Products Co., Lorain, Ohio, has recently completed its new factory for the manufacture of toy balloons, bathing caps, etc., and have it fully equipped for production June 1. Nelt Barr, formerly of Ashland, Ohio, now of Lorain, is president and general manager. The other officers are: John Dorn, vice-president; W. H. Adams, secretary and treasurer.

The Lima Rubber Co., Lima, Ohio, changed its name on April 28, 1920, to the Lima Cord Sole & Heel Co. The officers are J. E. Grosjean, president; F. L. Maire, vice-president; F. E. Harman, secretary; and Fred Cook, treasurer. The company manufactures the "Gro-Cord" sole and heel, described elsewhere in this issue.

B. E. Aaronson, special sales representative of the Mohawk Rubber Co., Akron, Ohio, for the last three years, has succeeded M. S. Lines as sales manager of The Gordon Tire & Rubber Co., Canton, Ohio.

On March 31, 1920, The Mason Tire & Rubber Co., Kent, Ohio, absorbed The Mason Cotton Fabrics Co., this now being known as the textile division of the rubber company. The rubber company's estimated sales for the quarter ended April 30 are between \$2,000,000 and \$2,500,000.

The Mansfield Tire & Rubber Co., Mansfield, Ohio, has elected the following officers for the ensuing year: C. R. Grant, president; G. W. Stephens, first vice-president and general manager; P. H. Ober, second vice-president; J. E. LaDow, secretary; Charles Hoffman, treasurer; and Carl L. Wilsey, assistant treasurer. The directors include all of the above and A. J. Reynolds in addition.

The Cincinnati Rubber Manufacturing Co., Cincinnati, Ohio, is building an addition to its factory, 55 by 246 feet, and a further extension is planned. The company recently increased its capital stock to \$1,500,000, of which \$500,000 is preferred.

The Universal Film Manufacturing Company, New York City, sent out invitations recently to those who might be interested in viewing a series of motion pictures visualizing the production of tires from the raw material to the finished product. The pictures were shown at the Broadway Theatre, 41st street, under the joint auspices of the educational department of the film company and The Goodyear Tire & Rubber Company. The pictures were taken on the Goodyear plantation in Sumatra and in its factory in this country.

John Miller, for the last seven years with The Faultless Rubber Co., Ashland, Ohio, has been appointed factory superintendent of The Barr Rubber Products Co., Lorain, Ohio.

The Ashland Tire & Rubber Co., Ashland, Ohio, is erecting, back of its main factory building a structure 100 by 120 feet for miscellaneous storage, reclaiming plant, and cement room.

The Columbus Tire & Rubber Co., Columbus, Ohio, has recently increased its capital stock to \$1,275,000.

The Lima Rubber Co., Lima, Ohio, has changed its name to The Lima Cord Sole Heel Co. The officers are: J. E. Grosjean, president; F. L. Maire, vice-president; F. E. Harman, secretary; and F. W. Cook, treasurer. The company manufactures a cord-fabric sole and heel described elsewhere in this issue.

The Gordon Tire & Rubber Co., Canton, Ohio, has elected the following officers for the ensuing year: H. B. McMaster, president; C. W. Keplinger, vice-president; and C. J. Keplinger, secretary and treasurer. B. E. Aaronson is sales manager and C. E. Jaynes is purchasing agent, while George A. Bockius is equipment engineer.

The plant of The Oak Rubber Co., Ravenna, Ohio, which was totally destroyed by fire on March 15, is being rebuilt to include two units, 40 by 200 feet and 60 by 200 feet, respectively, and a power unit 40 by feet. The construction is reinforced concrete, and a sprinkler system and special equipment for fighting fires will be installed. The company manufactures dipped rubber specialties and toy balloons. New machinery will be installed so that production may begin in August.

The L. & M. Rubber Co., Carrollton, Ohio, has changed its name to The Tuscan Tire & Rubber Co. and increased its capital to \$1,000,000, with the same officers as before, namely: T. J. Saltzman, president; J. H. Richards, secretary; and H. J. Richards, general manager. C. W. McKone and A. W. Senz, formerly with The Gordon Tire & Rubber Co., Canton, Ohio, have become associated with the Tuscan company, Mr. Senz being sales manager. Two lines of tires will be manufactured, the Tuscan which is an air-bag tire in both cord and fabric, and the Buckskin which is a molded tire in fabric and air-bag in cord. The latter is to be for the development of the jobbing trade exclusively.

The Imperial Rubber Co., Orrville, Ohio, has recently been incorporated in that state, at \$25,000, to manufacture toy balloons at first and later, rubber sundries and specialties. The concern has purchased the J. D. Mullet Building, on Pine street, until recently occupied by the Glamorgan Rubber Co. The incorporators of the new company include Fred F. Flinn, of Ashland; S. S. Hobbs, of Oberlin; H. H. Hoberg, of Ravenna; H. A. Flinn, J. D. Mullett, and Fred S. Gill, of Orrville. H. Hoberg will be general superintendent.

The Cascade Tire & Rubber Co., Ravenna, Ohio, has elected the following officers: Harry C. Thomas, president; E. W. Davis, vice-president; S. G. Abbott, secretary and treasurer.

The Excel Rubber Co., Wadsworth, Ohio, has recently completed its new factory, 112 by 180 feet, two stories in height, with two wings 60 by 40 feet, of brick and steel construction. Machinery is being installed and production will begin at an early date. Three kinds of tires will be made, namely, a high-class fabric tire, a high-class cord tire, and a medium-priced tire, as well as accessories.

The Master Tire & Rubber Co., Dayton Ohio, has increased its capitalization from \$300,000 to \$1,000,000 in order to erect a six-story building to increase its capacity to 2,000 tires daily.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has elected the following new officers: E. C. McGraw, president; John Morgan, vice-president and treasurer; R. W. McGraw, vice-president; L. M. Kyes, secretary; and H. C. Johnston, assistant secretary.

The Reynolds Machine Co., Massillon, Ohio, has appointed Frank B. Longnaker general supervisor of its tire mold, core, and rubber mill equipment department which it has recently established. Mr. Longnaker was formerly general superintendent and sales manager of The Banner Machine Co., Columbiana, Ohio, manufacturer of tire molds and equipment, and also with The Goodyear Tire & Rubber Co., Akron, for eight years, in charge of its machine shop.

CLEVELAND NOTES.

The Malay Rubber Co., 1034 Guardian Building, Cleveland, has been organized to manufacture Malay tires. The officers are: Charles L. Blatz, president; Owen Moynihan, vice-president and general manager; R. L. Queisser, treasurer; and E. E. Sprague, secretary.

The Ideal Tire & Rubber Co., Cleveland, will increase its output of Greyhound tires to 300 a day, beginning June 1.

The India Tire & Rubber Co., Akron, has opened a branch at 65th street and Carnegie avenue, Cleveland, Ohio, in charge of Ode Russ.

The Wellman-Seaver-Morgan Co., manufacturer of rubber factory equipment and special machinery, on March 31 removed its Akron office in charge of L. N. Ridenour to its general offices at 7000 Central avenue, Cleveland.

The Etna Rubber Co., 811-815 East 79th street, Cleveland, is specializing on hard rubber molded goods for batteries. The company has recently been reorganized and the capital stock increased to \$300,000. A factory addition is planned in which additional machinery will give the concern three times its present production.

The D. & M. Cord Tire Co., Cleveland, has changed its name to The Denman-Myers Cord Tire Co. Walter R. Denman is secretary and general manager.

"The Rubber Age and Tire News" and "Tire Trade Journal," New York City, have established an office at No. 828 The National City Building, Cleveland, in care of F. H. Van Horn.

THE RUBBER TRADE IN THE MID-WEST.

By Our Regular Correspondent.

MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.

THE MAY MEETING of the Mid-West Rubber Manufacturers' Association was held on the 11th of last month at the Chicago Athletic Club with sixty members present. The following new members were admitted:

REGULAR MEMBERS.

The Sebring Tire & Rubber Co., Sebring, Ohio.
The Carey Tire & Rubber Co., Carey, Ohio.
The Monarch Rubber Co., Canton, Ohio.
The Porter Rubber Co., Salem, Ohio.
The Knox Tire & Rubber Co., Mount Vernon, Ohio.
Ardmore-Akron Tire & Rubber Co., Oklahoma City, Oklahoma.

ASSOCIATE MEMBERS.

Allen Machine Co., Erie, Pennsylvania.
Wishnick-Tumpeier Chemical Co., Chicago, Illinois.
The Barrett Co., Chicago, Illinois.
"The Tire Rate Book," New York City.
H. A. Astlett & Co., New York City.
Bankers' Audit & Appraisal Co., Chicago, Illinois.

Last month the Association sent out a good deal of literature to its members for their guidance and information, notably: a weekly review of the crude rubber market; lists of articles and material wanted or for sale; reports on special subjects, like the coal situation; and notification of important news, as the meeting of the Reserve Board directors to consider the restriction of credits.

MID-WEST NOTES.

After being located 27 years at 160 West Jackson Boulevard, Chicago, Illinois, A. W. Smith, western representative of the Goodyear's India Rubber Glove Division of the United States Rubber Co., has removed to Room 917, 115 South Dearborn street.

The Chicago branch of the Star Rubber Co., Akron, Ohio, is in charge of E. A. Peterson.

The J. W. P. Tire Co. has been organized at Scottsburg, Indiana, with W. L. Hubbard as president, to manufacture a pneumatic tire. The company expects to build a factory soon.

The Zonta Tire & Rubber Co., 404 Iowa Building, Sioux City, Iowa, has begun the construction of a \$350,000 plant at 3100 Floyd avenue, Sioux City, where it is expected to begin manufacturing about October 1 of the present year. The officers of the company are: T. P. Scott, president; Fred Bartelt, vice-president; H. W. Caldwell, secretary, and F. J. Simmons, treasurer.

The Pawnee Tire & Rubber Co., Waterloo, Iowa, which was incorporated under the laws of the State on July 18, 1919, with \$1,000,000 eight per cent cumulative participating capital and \$500,000 common, has recently purchased a building at Cedar Falls, containing 36,000 square feet of operating floor space, besides a two and one-half-story office building and two two-story storage buildings, and plans to begin manufacturing in the autumn. The officers of the company are: E. D. Flynn, president; Charles F. Sawyer, vice-president and general manager; William J. Murphy, treasurer; and E. J. Murphy, secretary. These, with E. D. Flynn, Jr., also compose the board of directors.

The W. A. Shaeffer Pen Co., Fort Madison, Iowa, manufacturer of fountain pens, etc., has increased its capital stock from \$1,500,000 common and \$75,000 preferred to \$1,500,000 common and \$2,500,000 preferred, making a total of \$4,000,000.

The factories of the Wildman Rubber Co. will be located at Pay City, Michigan, where it has acquired 63 acres of land with a frontage of half a mile on the Saginaw river and its deep water channel. The Michigan Central and Grand Trunk rail-

roads run through the property and electric power is available from the plants of the Commonwealth Power on the Au Sable river and other sources. A modern factory will be erected here and the first unit will be capable of turning out 2,500 tires and 5,000 tubes daily. W. W. Wildman, Detroit, who has had nearly a quarter of a century of experience in the rubber business, is president and general manager; L. C. MacGregor is vice-president; and C. R. Twynham is secretary-treasurer. All three were formerly with the Portage Rubber Co., Akron, Ohio. The office of the Wildman company is at 817 Book Building, Detroit, Michigan.

The Ajax Rubber Co., Inc., New York City, has appointed L. M. Van Riper district manager with headquarters in Detroit, Michigan. Its territory includes a considerable portion of northern Ohio.

The Curtis Tire & Rubber Co.'s plant at Muskegon, Michigan, was entirely destroyed by fire last month.

A. G. Spalding & Bros., sporting goods dealers, have removed from 415 North Seventh street, St. Louis, Missouri, to 823 Locust street, opposite the downtown postoffice, in the shopping district.

At the annual meeting of the stockholders of the Premier Tire & Rubber Co., Kansas City, Missouri, the following directors were elected: J. G. Joce, Carter Wilder, C. R. Renolds, A. J. Woodring, C. A. Wooley, Walter Maloney, and B. J. Riser. The capital stock was also increased from \$300,000 to \$1,500,000 and a stock dividend of 100 per cent declared on all outstanding stock. The company is now building 50,000 square feet of floor space.

The Surety Tire & Rubber Co., St. Louis, Missouri, is perfecting plans for the production of 1,000 Sternwear casings daily. William L. Burgess is vice-president and general manager.

The Rawlings Manufacturing Co., St. Louis, Missouri, manufacturer of game balls, has leased the two-story building at the northwest corner of Twentieth and Locust streets for two years, and will occupy the premises temporarily until the completion of the addition to its factory on a 50-foot lot west of the present factory on Lucas avenue. W. P. Whitley is vice-president and general manager.

The Overland Tire & Rubber Co., Omaha, Nebraska, has promoted F. C. Rudisell from the position of secretary and sales manager to that of general manager.

The Black & Decker Manufacturing Co., Towson Heights, Baltimore, Maryland, has established a permanent office and show room for the display of its portable electric tools and special machinery at 1436 South Michigan avenue, Chicago, in charge of R. G. Ames, whose territory will include the entire Mid-West. He will be assisted by F. E. Marrior and J. N. LaBelle.

The Stanwood Rubber Co., 9 East 40th street, New York City, and Elizabeth, New Jersey, has opened a Chicago office at 1712 South Michigan avenue, in charge of J. H. Greer, who is district manager of both the Stanwood company and of the Hardman Tire & Rubber Corporation, Belleville, New Jersey.

The Zeglen Tire & Rubber Co., Inc., 118 North La Salle street, Chicago, Illinois, a newly incorporated company, has purchased the plant of the Century Rubber Works at Elston and Rawson streets, Chicago, and expects to start producing a one-ply interwoven tire under its own patents about July 1. John B. Drish is acting president and vice-president and Frank J. Kolodzinski is secretary and treasurer.

The Burdick Tire & Rubber Co., Chicago, Illinois, has removed from the Consumers' Company Building to 10 South La Salle street. The present officers are: Henry G. Steinbrenner,

president; Frank E. Teachout, vice-president and general manager; and Harlow P. Steinbrenner, secretary and treasurer. The new factory of the company at Noblesville, Indiana, is of reinforced concrete throughout and has a floor space of 66,000 square feet. It is three stories high.

The Sewell Cushion Wheel Co., Detroit, Michigan, has purchased property at 2711-2717 South Wabash avenue, Chicago, 80 by 190 feet, on which it will erect a one-story building with a foundation to carry a second story. A portion of this structure will be used for Chicago service and the balance for manufacturing and assembling. The total investment, including machinery, will be \$75,000.

At the annual meeting of the American Zinc Institute, in Chicago, where Charles M. Schwab, who has become interested in zinc, was a speaker, the following officers were elected for the ensuing year: president, E. H. Wolff, of the Illinois Zinc Co., Peru, Illinois; first vice-president, J. L. Bruce, of the Daly Travis Copper Co., Butte, Montana; second vice-president, Edgar Palmer, of the New Jersey Zinc Co., Inc., New York; third vice-president, F. C. Wallower, of Joplin, Missouri. The next meeting will be held in St. Louis.

The National Association of Waste Material Dealers, Inc., notifies its members that the classifications covering rubber expire July 1, and new ones become effective for one year from that date. Members are requested to notify the secretary of any changes they wish to have considered at the June meetings.

The Wishnick-Tumpeer Chemical Co., North Pier Terminal, 365 East Illinois street, Chicago, was incorporated May 4, 1920, under the laws of that State, with a capitalization of \$100,000, to conduct a business as importer of and dealer in chemicals, oils and colors, specializing in rubber compounding ingredients. Stocks of standardized materials will be carried for the convenience of rubber manufacturers in the West and Mid-West. The officers are: Robert I. Wishnick, president and treasurer; Julius Tumpeer, vice-president; David Tumpeer, secretary. The company will be able to handle carload shipments on its own private switch and make freight shipments direct from its terminal through the tunnel system.

Reichel & Drews, formerly at 559 West Lake street, Chicago, Illinois, manufacturers of fabric-cutting machinery, have removed to their new factory at 452-456 North Ashland avenue, Chicago.

Thomas E. Wilson & Co., Chicago, Illinois, sporting goods manufacturer, has taken over the Chicago Sporting Goods Manufacturing Co. Fred J. Ratsch, formerly the head of the latter concern, will be director of the jobbers' division of the Wilson company. The large new factory Mr. Ratsch was building at Powell and Charleston streets, included in the transaction, will give the Wilson company 100,000 additional square feet of manufacturing space.

O. E. Truesdell has been appointed district manufacturers' representative for the Firestone Steel Products Co., Akron, with headquarters in Indianapolis. He will take over portions of the territory heretofore handled by L. W. Enos and A. B. Droeger from Chicago and Detroit, respectively.

The Double Fabric Tire Co., Auburn, Indiana, maker of Auburn tires and tubes, attaches a tag stating the percentage of pure Para rubber used in each Auburn certified tire.

The International India Rubber Corporation, South Bend, Indiana, has appointed F. A. Rendon manager of its export department. He was formerly with the Pirelli Company, Italy, and the Lee Rubber & Tire Corporation, New York City.

The Quality Tire & Rubber Co., Anderson, Indiana, recently absorbed by The Long-Wear Tire & Rubber Co., has reduced its capital stock from \$4,700,000 to \$4,150,000 common, and \$500,000 second preferred has been created.

The Fort Wayne Tire & Rubber Manufacturing Co., Fort Wayne, Indiana, has increased its capital from \$1,000,000 to \$2,500,000. J. C. Brown is president of the company.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

LOS ANGELES NOTES.

THE PACIFIC COAST DÉBUT of the rubber bathing suit, the rubber beach cloak, and the rubber bathing hat was made but a fortnight ago in Los Angeles. That these newest styles struck popular fancy was evidenced by the admiring comments made among the forty thousand people who viewed these novel costumes at the Venice beach parade held on May 16.

Some 300 attractive girls, many of them noted screen stars from the nearby Hollywood film studios, were the primary attraction. They were garbed in every conceivable kind of modish garments suitable for actual and near-bathing; and while most of the cloth creations worn were undeniably pleasing to the eye and some of them strikingly artistic, the rubber novelties made a distinct hit. The general verdict was that they would have been equally appreciated even though they were not displayed by rather pretty mermaids.

The United States Rubber Co., which had a short time before shown the hats, capes and suits on living models at the Hotel Alexandria, Los Angeles, to buyers from many stores, had a special rubber exhibit. The advantages of the all-rubber bathing suit are that it quickly sheds water, dries in a few moments, and, unlike the damp cloth garments, can be carried about comfortably. There is a promising field for rubber bathing apparel on the Pacific Coast, as the mild climate permits bathing practically the year around on its numerous fine beaches.

The West American Rubber Co., 400-432 North Avenue 19, Los Angeles, announces the appointment of C. Lamb as superintendent. Mr. Lamb was formerly connected with the Cincinnati Rubber Manufacturing Co., Cincinnati, Ohio.

Another big tire factory may soon be established in Los Angeles to serve the West Coast trade. Preston E. Roberts, president and general manager of the Perfection Tire & Rubber Co., Fort Madison, Iowa, has been in Southern California in conference with Guasti, House & Guilli, Inc., and W. L. Bartlett, distributors of Perfection tires. In order to overcome the transportation handicap between the Mid-West and the Coast, and to expedite distribution, Mr. Roberts feels that a factory here is indispensable.

The Goodyear Tire & Rubber Co. recently broke all records of the Los Angeles Chamber of Commerce by applying for 100 memberships for members of its new factory force, and bringing the roster of the local trade board up to the 6,200 mark.

The Goodyear company has, through its subsidiary, the Southwest Cotton Co., acquired the 7,000-acre Marienette ranch of R. P. Davie to add to its 25,000-acre holdings of prime cotton-growing land in Arizona. The price of the 7,000 acres is put at \$1,000,000. Pima cotton grown here has brought as high as \$1.25 a pound on a \$19,000 purchase. A dollar a pound is guaranteed to growers on the next crop.

Work has been started at El Segundo, a beach town close to Los Angeles, on a \$2,000,000 plant for the General Chemical Co., New York City.

Practically all the leading tire makers and jobbers of Los Angeles are members of the recently reorganized Automobile Tire Manufacturers' and Jobbers' Association, of which Frank R. Price, of Nelson & Price, is president. The association will

strive to correct abuses in the tire trade, establish selling standards, and promote the interests of its members in every reasonable way.

Ernest E. Gagnon, of the Seal-It Company of New York, has been perfecting plans here for a factory to make the company's puncture cure compound. The Los Angeles factory will be the company's third, it already having two in the East.

The Fordtire & Rubber Co., Fort Worth, Texas, is planning to build a factory in Los Angeles. The company specializes on a puncture-proof process for tires, now licensed to repair men. E. A. Boyle, 517 East Ninth street, is California state manager.

The Los Angeles Pacific Navigation Line, a new company, announces that it will put on a line of vessels, running directly between Los Angeles and Singapore and the Far East. One main object is to supply the rubber factories which are being built in and near Los Angeles. It has established branch offices at Manila, Kobe, Hongkong and Shanghai, also.

George T. Bell, head of the Bell Rubber Co., started in the tire business in his native city, St. Louis, ten years ago, and moved a few years later to Akron, Ohio, where his plant now covers a city block and its output is over 100 solid tires a day. He is also head of the Tire Construction Co., West Pico and Olive streets, Los Angeles, with fine tire salesrooms, and is reputed to do the largest tire repair business on the Coast, employing forty vulcanizers.

One of the first men in the trade to develop rubber specialties on a large and varied scale for the motion picture industry in the Southwest is Douglas R. Radford, president of the West American Rubber Company, Los Angeles.

DOUGLAS R. RADFORD.

Born in London, England, in 1883, he studied engineering and qualified at the age of twenty for the position of assistant engineer of a tea plantation in Burma, India, but just as he was about to leave for the Far East the company changed its plans and left him without an engagement. He then decided to go West and take up ranching in California, but after a few months there he was called home on account of family illness and spent another year in London. The lure of the West, however, was too strong for him to resist, and he returned to Los Angeles in 1907.

After working for three years at "everything from Secret Service to bridge-building," he accepted the task of putting the West American Rubber Company on its feet. In this work he has been ably aided by the secretary, C. R. Prentiss, also an engineer, and the concern has made gratifying progress. Recently the company strengthened its working force, installed more machinery, and is making plans for a large addition to the plant.

The company has been making rubber supplies for oil wells and various patented novelties, but is also branching out into other lines.

The rush of big rubber men to secure cotton acreage and cotton itself is over until next fall. All of the large tire interests have been in evidence here this year. The Seiverlings, the Fisk company, the United States Rubber Co., the Firestone company, The Miller Rubber Co., and others have been and gone and the long staple crop is presumably buttoned up.

J. B. Magee, manager of the United States Rubber Company's branches in southern California and Arizona, is accounted one of the most energetic trade developers in the Southwest.

J. B. MAGEE.

He made his debut in the rubber business eight years ago, when he became a statistical clerk in the office of the United States Rubber Company in San Francisco. His executive ability was soon recognized and he was repeatedly promoted, and finally put in charge of the Phoenix branch. On January 1, 1916, he was appointed to his present position, and at once began to organize an efficient sales force. That he made capable selections and infused into his lieutenants much of his own enthusiasm and fidelity is amply attested by the steady and considerable growth of the company's business in the territory allotted to him. To his aides Mr. Magee generously gives the major share of the credit for his success. His main office is at 923 South Los Angeles street, Los Angeles, and the line includes everything manufactured by the big concern he represents.

F. F. Schaffer, president of Goodyear's India Rubber Glove Manufacturing Co., and Arthur Reeve, assistant general manager, footwear division of the United States Rubber Co., have just visited the Pacific Coast, including Los Angeles, San Diego, and San Francisco, as well as the Grand Cañon.

GOODYEAR'S CALIFORNIA PLANT NEARING COMPLETION.

This illustration is from a photograph, taken from an airplane, of the buildings and grounds of the Goodyear Tire & Rubber Company of California, at Ascot Park, Los Angeles, as

AERIALVIEW OF GOODYEAR PLANT, LOS ANGELES, CALIFORNIA.

they are now, a year after ground was broken. A bit of Los Angeles shows in the background. The picture may be compared with that of the projected plant in *THE INDIA RUBBER WORLD*, August 1, 1919.

SAN FRANCISCO NOTES.

At the World Metric Standardization Conference at the Palace Hotel the delegates to the Seventh National Foreign Trade Convention, just before departing, heard with much interest an address by Burgess Darrow, of the technical division of The Goodyear Tire & Rubber Co. of Akron, Ohio, on the reasons why his company has decided to adopt the metric measurements exclusively in not only marking sizes on tires, but also in calculation, construction, and in operation throughout the parent plant and the new branch concern being started in Los Angeles.

Tire makers have been invited to enter tests of non-skid products at the annual convention of the National Traffic Officers' Convention to be held here in August. A committee of members of the Advertising Clubs of America will act as judges with traffic officers from many cities in the Union. The streets in front of the Auditorium, where the convention will be held, will be made as wet as possible and the cars competing must be able

to stop quickly according to rigorous rules. A severe test will also be made of brake linings.

Frazar & Company, New York City, crude rubber importers and exporters, have opened an office in the First National Bank Building, San Francisco, to provide further facilities for Pacific Coast exports and imports. They already have an office in the New York Building, Seattle, Washington.

The Pacific Mail Steamship line runs two steamers regularly between San Francisco and Calcutta, via Singapore, and seven steamers handed over by the United States Shipping Board are conveying cargo between Shanghai and Calcutta and acting as feeders for the trans-Pacific lines. Two American companies, the Robert Dollar and the Independent steamship companies, which have maintained a freight service in the East for some time, are adding to the shipping facilities between Singapore and the United States.

The Coast Tire and Rubber Company, 408-409 Syndicate building, Oakland, California, has secured a six-acre site in that city, where it will establish its new tire plant. The main building will be 72 by 360 feet, and the other buildings will include steam plant, machine shop and offices. The company was incorporated August 29, 1919, and the officers are: Holmes Ives, president; John I. Pankratz, vice-president; N. B. Campbell, treasurer, and W. D. Forbes, secretary. In addition to the above, the directors include Harold Giesse, Roy Thorpe, N. J. Whelan, A. L. Warmington and Francis H. Woodward. E. Lawthorn, formerly factory superintendent for the Federal Rubber Co., Cudahy, Wisconsin, and for the Gillette Rubber Co., Eau Claire, Wisconsin, is factory superintendent.

H. W. McKevitt, head of the McKevitt Auto Supply Co., has been appointed retail distributor of Lee tires in San Francisco.

SAN DIEGO NOTES.

H. S. Firestone, president of the Firestone Tire & Rubber Co., with his sons, Leonard and Raymond, and Barney Oldfield, were guests of friends in San Diego recently. Mr. Firestone has been making an automobile tour of Imperial Valley, and has been urging the farmers there to raise more long-staple cotton, for which there is a great demand among tire manufacturers. The Firestone concern is a heavy buyer of raw cotton and has several gins in the valley.

Credit for making the first pneumatic tire west of Chicago is claimed by the Savage Tire Co., which produced a perfect casing in 1912 at its factory in San Diego, and since that time the business has grown extensively on the Pacific Coast. John D. Spreckels, the sugar magnate, is said to hold controlling interest in the concern, which, since the first of February, has become known as The Spreckels "Savage" Tire Co., having purchased the assets of the Savage Tire Co. and the Savage Tire Corporation, both of San Diego. Plans are being made for a large extension to the plant which will give it a 100 per cent increase in production. The company will soon start to build a steel and concrete storehouse with a capacity for 70,000 tires. It will be seventy-five by six hundred and sixty feet with ten doors at which to load and unload freight cars. A three-day spring meeting of West and Southwest branch managers was held last month at the plant.

NORTHWESTERN NOTES.

Fred S. Wilson, vice-president and Pacific Coast representative of the Thermoid Rubber Co., Trenton, New Jersey, has been in Portland looking over trade conditions with the Allen & Hebard Co., local distributor of Thermoid tires.

The Oregon agency for Overman solid cushion tires in Portland has been taken by the Howell-Swift Tire Company, which handles Canton cord and Blackstone tires in this section.

E. B. Conlee, western representative of the Stanwood Rubber Co., Elizabeth, New Jersey, has been busy during the past few weeks establishing agencies for Stanwood tires in Spokane, Seattle, Portland, San Francisco, Fresno and Los Angeles.

Clyde S. Thompson, advertising manager for the Portage Tire & Rubber Co., Akron, Ohio, is studying trade conditions on the Coast.

A recent estimate puts the number of motor trucks in use in the seven states west of the Rocky Mountains as 110,000, California leading with 58,700.

SOUTHWESTERN NOTES.

A hangar for the dirigible balloon of the Goodyear Tire & Rubber Co., known as the pony blimp, is being erected at Litchfield, Arizona, where plantations of the Southwest Cotton Company, a subsidiary of the Goodyear concern, are located. The blimp will be used by the Goodyear company in messenger service between the cotton fields in Arizona and the new Goodyear factory in Los Angeles, with an intermediate stop at Blythe, California. It is 95 feet long, carries two persons, and is capable of a speed of 40 miles an hour for ten hours.

A new and larger supply station for the distribution of Miller tires in San Diego and Imperial counties has been established at Fourth and B streets, San Diego. F. C. Millhoff, general sales manager of the Miller company, has been a recent visitor in Southern California.

The Imperial Valley Cotton Growers' Association of California, which from 120,000 acres supplies cotton for tire fabrics, has petitioned the Federal Government for the admission of 2,000 Mexican laborers to handle the 1920 crop, on account of the great scarcity of American labor. At the end of the season the aliens would be sent back over the border line. Imperial Valley bankers will finance the plan.

Wayne Murray and George S. Danaher, doing business as Murray & Danaher, have become the agents for the Swinehart tires in the Southwest, covering the states of Texas, Oklahoma, New Mexico, Louisiana, and Arkansas. Both were in the government motor service during the war and have had long experience in the automobile business. Their office is at 506 Trust building, Dallas, Texas.

THE AD-MOR-MYLER INNER TUBE.

This is a special inner sole tire which, it is claimed, overcomes all the drawbacks of many such tire-saving devices now on the market. This supplemental tire is designed to save inner tubes from punctures, and can be transferred when the casing is worn out to a new one. A double rubber bead is used to strengthen the tire, take the strain off the rim edge, and, it is said, makes rim blow-outs almost impossible. The edge is feathered to prevent pinching in the casing. This inner sole tire is produced by the Ad-Mor-Myler Rubber Company, a recently incorporated Delaware corporation; capitalized for \$1,000,000. Its president and founder is A. Jacquins. Henry Josephs is sales manager. To

A NOVEL INNER TIRE.

meet the growing demand the company will soon erect a six-story factory, 150 by 160 feet, at Sixth and Alameda streets, Los Angeles.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE TWO TOPICS about which one hears most at the time of writing are the favorable position of the raw rubber market—that is, for the manufacturers—and the budget with its increase of the excess profits duty from 40 to 60 per cent and the limited company profits tax of one shilling on the pound. This latter tax will no doubt be the eventual permanent form of the temporary excess profits duty, and its present imposition is in order to get at the undivided profit put to reserve and afterwards distributed in the form of bonus shares. It cannot be denied that our manufacturers generally are doing much better than was expected, owing to the dearth of goods in many countries, but they complain that the new taxes will have a most injurious effect upon trade, as the large profits are required to provide the extra working capital needed on account of the increased prices being paid for practically everything. Perhaps this statement should be taken with the proverbial grain of salt, but to my mind the real trouble lies in the not too distant future when European production of goods approaches the pre-war standard and we have to meet serious competition with our high wages bill and reduced output due to shorter hours of work.

The present dullness in the rubber share market must be attributed to the price of the commodity rather than to the new excess profits duty, for although the newer companies are hard hit by this tax, it is confidently expected that in 1922 demand will overtake supply, with financial results that will more than make up for any temporary setback in dividends. On this point we must wait with all the patience we can command to see if the prediction comes true.

WOMEN IN RUBBER MILLS.

In further reference to some remarks in the April issue of THE INDIA RUBBER WORLD on the increased employment of women in rubber factories, the position here, speaking generally, is that the women taken on to replace men who were called up for service in the war have been displaced by the latter on their return. In those cases where the men have unfortunately not returned or have preferred to take up some other occupation, the women have remained at their new work where this has been satisfactorily performed. Thus one can still see women engaged at mixing rolls, spreading machines, etc., work in which they did not participate before the war, and this in the smaller concerns where the nurse, the rest room and hot coffee have not yet made their appearance.

The cotton mill boom appears to have almost spent itself, and the trade is now threatened with a general strike of the operatives for a larger share in its emoluments. There is hope that the matter may be amicably settled, but the price of fabric is going to continue a source of anxiety to those in the rubber trade who use it extensively.

CELLULOSE IN RUBBER.

The authors of the analytical method for determining the amount of cellulose in rubber goods have rightly drawn attention to the fact that a wide search for various substances is essential if the determination of rubber by difference is to be taken as accurate. Except in such cases as fiber boot soles and one or two other instances where the cellulose is present in fairly large amount as a normal constituent, it seems unlikely that the somewhat tedious method worked out will be a matter of common application. When referring to experimental or analytical work on reclaimed rubber the latter ought to be fully described, as its variations are so great. In rubber reclaimed by the mechanical method, no doubt the little cellulose left would be in the form of the original cotton, while in an alkali reclaim

it would be there, if at all, as oxy-cellulose, and it may be that the acetylation method will not prove satisfactory in the latter case. It is doubtful whether the cellulose determination as an index to the presence or absence of reclaimed rubber in a mixing will be found as reliable as the other indirect methods which have preceded it.

THE RESEARCH ASSOCIATION OF BRITISH RUBBER AND TIRE MANUFACTURERS.

The appointment of D. B. Porritt, chief chemist of the North British Rubber Co., Limited, to the post of director of research has been received by the trade generally with approbation, and with particular satisfaction by his personal acquaintances. He combines academic distinction with that practical knowledge which can be acquired only by many years of close association with manufacturing, and the field in which such associated qualifications are to be met with is by no means a large one. This does not imply that the task of the selection committee was devoid of all difficulty, but it is clear to outsiders intimately acquainted with the trade that if there were hundreds of applicants for the advertised post it would be a very simple matter to reduce them to a round dozen.

It is rumored that the work, which at first will be on somewhat modest lines, will take place in London, though the actual spot has not yet been announced—perhaps it has not yet been decided upon. The main activities of the Research Association, it is understood, will be concerned essentially with fundamental problems rather than with works difficulties and this is as it should be, seeing that half the money is put up by the taxpayers who, it appears, are not to be favored with details of the discoveries made or work carried out. Speaking of research associations generally which are now in progress of formation for various industries and not specially of what may happen in the association under notice, calls to mind the position of affairs which led to complaints against the National Physical Laboratory a year or two after its foundation when a good deal of routine work ordinarily undertaken by professional analysts was being done. The interesting announcement is made that the committee in control of the work intends, if it seems desirable, to secure the services of independent rubber chemists to assist in special work.

THE PROOFING TRADE.

It is a sign of the progress that America has made during the war period that the present demands of Canada are being so largely met from the States instead of from Great Britain, as was formerly the case. This defection is not a matter of great concern at the moment because proofers have plenty of work on their hands, but all the same, efforts will doubtless be put forth to regain the lost trade. Other countries, which in normal times would be doing more proofing on their own, are held up by a shortage of cloth, a point which is all in favor of our export trade. It rained steadily all April, which encouraged the mackintosh as against the mere raincoat, an article which appears to be losing some of its former popularity. It seems to have come home to many purchasers that this latter is a nice looking comfortable sort of garment for fine weather or for wet weather if you have an umbrella with you.

It comes somewhat as a shock to hear that Vickers, Limited, the armament firm of Sheffield, is going into the waterproof garment trade at its Dartford Works. It is common knowledge that the firm controls the cable works of W. T. Glover & Co., Limited, of Manchester, but it is not widely known that it is the proprietor of the Ioco Proofing Co., Limited, of Anniesland, Glasgow, where a large amount of airship material was proofed

during the war. The firm is also understood to be interested in bakelite synthetic resin manufacture.

The Monarch Rubber Co., Limited, of Bradford Road, Manchester, proffers to the trade, are engaged in fitting up more extensive new premises at Miles Platting, a mile or so away, and the Monarch Waterproof Co., Limited, which does the making-up side of the business, will also be moving shortly from its present address in Cheetham, Manchester, to more commodious premises in Lower Broughton Lane, Manchester.

To commemorate its Silver Jubilee the waterproofing firm of Ferguson, Shiers & Co., Limited, has issued an illustrated souvenir giving details of the work and machinery.

Rubber proofing is carried on at Phoenix Mills, Failsforth, Manchester, and rainproofing at Blossom Mills, Strangeways, Manchester. Interest attaches mainly to the large new mill erected at the Failsforth Works during the war, which for certain reasons was taken over on completion by a new company, in which Messrs. Frankenburg were largely interested, to do a certain class of work for the Government. As the armistice was signed shortly after the formation of the company, this work was never entered upon and the new mill has now reverted to Ferguson, Shiers & Co., Limited. The building, which is well planned with lofty work rooms, contains 15 mixing machines and 36 spreading machines and embodies all the latest conveniences for dealing with large quantities of single and double-texture proofing in a hygienic manner, the ventilation system having been designed to meet the latest requirements of the Dangerous Trades Department of the Home Office. This firm is quite distinct from that of A. O. Ferguson & Co., Limited, which is located a mile or two away and which was founded some years ago by the son of G. E. Ferguson, the late senior partner of Ferguson, Shiers & Co., Limited.

Worries incidental to labor, mainly with regard to remuneration, are a somewhat warm theme, but of late a new sort of labor worry has made itself felt. This is concerned with the action taken by men's unions in cases where individuals are inclined to grumble about their accoutrements. To take a concrete case, the railway companies fit out their servants with mackintoshes, usually blue or black shades for station masters and porters, and stout drill khaki ones for those engaged in rough work, like shunters. Whereas ten years ago complaints were practically unknown, some workman, who may possibly have misused his garment, makes a fuss about its inferiority and his union takes the matter up and starts correspondence with the officials, who pass the complaint on to the manufacturers.

RUBBER SPONGES.

The recent Drapery and Textile Exhibition, held in London in April, was not remarkable for its rubber exhibits, though a word or two may be said about the sponge display of the Sorbo Rubber Sponge Products, Limited. This business, which is carried on in London to work a process of G. Leeson, late of Manchester, has met with considerable success in the sale of its yellow natural-color sponges, which are not damaged by soap. The business having outgrown the dimensions of the London works, a new factory is being fitted up in the more countrified surroundings of Woking, where a considerable number of hands will be engaged. A development of interest is the use of the sponge compound for toys and balls to take the place of inflated rubber articles and of celluloid goods. It is also to be used for truss pads and for other purposes such as flooring where resiliency is a desideratum. Such uses of sponge rubber seem to indicate a development of considerable significance to the rubber trade. Anyway, we have passed the initial stage of sponge making with which many of our rubber firms were wrestling not so many years ago.

BRITISH NOTES.

Edwin Swann, who was for fourteen years representative of the Anchor Chemical Co., Limited, has recently joined Alfred

Smith, Limited, chemical manufacturers of Manchester, England.

An exhibition of specimens showing the diseases to which rubber trees are subject was recently held at the Imperial College of Science and Technology in South Kensington, London. It was arranged by Professor J. B. Farmer, director of the biological laboratories of the college, the specimens being sent chiefly from Ceylon and Malaya. The exhibits are diagrams; actual trunks of *Hevea*, showing how tapping works; specimens of rubber trees showing the diseases to which they are subject, and cultures which have been transferred by inoculation since their arrival in England, from the tainted stumps to other plants.

ANOTHER TEST OF RUBBER PAVEMENT IN LONDON.

The new stretch of rubber road pavement in Southwark, London, which was mentioned in THE INDIA RUBBER WORLD last July, has been laid in a busy thoroughfare where it will be severely tested. It covers 400 square yards on one side of Borough High Street, between St. George's Church and the Elephant and Castle, and a great part of the South London traffic must pass over it.

The blocks are 9 by 3 inches and $\frac{5}{8}$ of an inch thick; $\frac{1}{4}$ -inch of gray rubber is placed on a layer of vulcanite held closely to a steel plate with circular perforations into which the vulcanite has been set to secure a firm hold. The steel plate is cut

RUBBER PAVING IN BOROUGH HIGH STREET, SOUTHWARK.

in four places and the strips cut are turned down to form lugs which are imbedded in a concrete foundation. The blocks rest on this granolithic concrete which is $3\frac{1}{4}$ inches thick.

This pavement was manufactured by the Leyland & Birmingham Rubber Co., Limited, and is looked upon as a great improvement on those that were experimented with before the war, such as that in the Old Kent Road. This road surface is claimed to be sanitary, noiseless, and non-skidding, all of which has been proved to the satisfaction of careful observers.

FOREIGN NOTES.

AT MANRESA, near Barcelona, Spain, an automobile tire factory has been established, which expects to make fifty tires a day, enough to satisfy the present demand. The main part of the factory is used to produce *alpargatas*, cheap canvas shoes such as the poorer Spaniards use, but with rubber soles. These will outlast by far the usual hemp soles and can be made at a smaller cost.

Automobile tires are in great demand in Sweden at present. Competition is keen with American tires predominating. There

is a considerable market for high-priced tires. The Swedish prefer hand-made tires. The increased sale of motor cars in recent months causes the demand for accessories and spare parts to exceed the supply. In 1916 the imports of tires from Great Britain amounted to \$151,500, from France to \$106,680 and from the United States to \$34,600.

NORWEGIAN TIRE DIMENSION REGULATION.

A new regulation proposed in Norway, relating to the dimensions of tires for use on trucks in that country, provides for the use of pneumatic tires on trucks smaller than 2-ton capacity, such as 1½- and 1-ton capacity, particularly for use on country roads. It is also proposed that the tread of tires used on country roads shall be not less than five inches. This legislation is being put forward in the attempt to prevent the spoiling of the roads which, otherwise, is looked for within two years.

A BIT OF HISTORY.

On the back of an interesting trade catalog of the year 1830, reproduced in facsimile by the Antwerp "*Bulletin des Planteurs de Caoutchouc*," and which antedates not only the Belgian possession of African territory but the establishment of the present Kingdom of Belgium, are printed the conditions of an impending rubber sale: 6,407 pairs of shoes of gum elastic which came by the good ship *Matilda* are to be sold, as well as 161 pairs that arrived previously by the ship *Diana*. They are of three standard sizes and are packed in barrels and the brokers who handle them are firms, some of which are still in the rubber business, namely, Grisar & Co., Oldenhoven, de May, Chantrelin and Ch. Franck & Co. The sale was limited to bona fide residents of Antwerp.

THE RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

THE LATEST OFFICIAL STATISTICS indicate that imports of crude rubber into Japan amounted in 1919 to 24,132,838 pounds valued at \$8,682,098, an increase of 7,771,936 pounds and \$2,207,979 over the 1918 imports. The rate of the increase is 48 per cent in quantity and 34 per cent in value, showing that the rubber manufacturing industry in Japan is continuing the remarkable progress made during the war. This is chiefly attributable to the increase of investors in the industry. Notwithstanding the increase in Japanese rubber goods exports, the manufacture of automobile and bicycle tires, rubber cloths and mechanicals, also industrial rubber goods for home demands, was materially increased.

IMPORTS OF CRUDE RUBBER INTO JAPAN.

	1918.		1919.	
From:	Pounds.	Value.	Pounds.	Value.
British India	526,168	\$334,207	577,447	\$306,306

Waterproof sheeting ..	79,798	25,006	26,759	138,559
Elastic webbing ..	24,566	11,924	11,924	234,425
Insulating tape ..	231,029	198,842	250,430	138,559
Woven belts and hose ..	231,029	198,842	250,430	138,559
Totals		\$793,913		\$1,696,019

In addition to the above imports of rubber goods, automobiles and parts (including tires) were imported to the value of \$5,641,150 in 1919 against \$3,830,906 in 1918; and bicycle tires and parts to the value of \$1,289,775 in 1919 against \$750,364 in 1918.

In 1912 rubber goods imports reached their highest mark, but as the Japanese rubber manufacturing industry developed, foreign goods imports gradually decreased. Automobile and bicycle tires are now well made in Japan and supply most of the demand. In 1919 automobiles were imported largely and are in large demand for business purposes, but not as a luxury.

EXPORTS OF RUBBER MANUFACTURES FROM JAPAN.

	1918.		1919.	
	Pounds.	Value.	Pounds.	Value.
Rubber toys and balloons ..	3,261,324	\$383,250	4,808,244	\$671,983
Rubber tires	12,742,382	2,253,469	12,501,023	3,557,018
Insulated wires	4,162,167	4,162,167	4,205,850	4,205,850
Other rubber manufactures ..	612,690	612,690	1,255,171	1,255,171
Totals		\$7,411,506		\$9,689,922

There were also exported 2,609 jinrikishas, valued at \$110,085 in 1919 against 2,651 valued at \$71,133 in 1918, and 5,600 bicycles and parts (exclusive rubber tires) valued at 1,690,918 in 1919, against 7,408 valued at \$2,161,334 in 1918.

The total values amounted to \$2,156,091 in 1915; \$2,934,940 in 1916; \$4,002,592 in 1917; \$7,411,506 in 1918, and \$11,490,918 in 1919. Jinrikishas for China, Hongkong, Straits Settlements and British India showed a gradual decrease, for they were exported as parts, not as completed vehicles. But the works have been erected in these districts to supply the parts and, on the other hand, the competition between jinrikishas and automobiles is beginning to be felt.

Owing to the interruption of trade during the war, Japanese rubber goods exports are increasing year after year, for the Japanese rubber industry is capable of supplying the lack of European and American goods in China, Manchuria, Malaya, British India, South Indies and Australia. Even now, after the restoration of peace, the Japanese rubber industry is still holding its gains during the war period.

NOTES FROM JAPAN.

Japanese rubber manufacturers have received enormous orders from Siberia. The Mitado, Toyo, Nippon and Meije factories have formed a combination to compete against the Dunlop establishment at Kobe.

In preparation for the expansion of automobile traffic, Japanese business men are about to form the Oriental Road Construction Co., with a capital of 10,000,000 yen. (One yen equals \$0.498.) Besides the bad roads, the weak bridges are a hindrance to motor traffic, and to the hoped for development of Japan's motor industry.

In 1918, Japan imported 6,454,696 pounds of crude rubber and gutta percha, of which 5,920,521 pounds came from the Straits Settlements.

THE RUBBER AND COTTON TRADE OF THE NETHERLANDS.

THE RUBBER TRADE of the Netherlands was virtually at a complete standstill during the year 1918. There were no imports or exports of rubber, and only a very small quantity of the stock on hand was delivered to manufacturers. During the first half of the year trade between the Dutch East Indies and the United States was insignificant. When business later picked up and prices increased, the European situation and American import restrictions brought the trade to a sudden end. Very little business was done between the Netherlands and her colonies.

For the two periods from March to August, 1918, and from September, 1918, to February, 1919, the distribution of crude

rubber by the Netherlands Overseas Trust to manufacturers was effected at the base price of \$1.18 per pound for prime *Hevea*, plus interest and warehouse charges from March 1, 1918. A lower price for the poorer qualities was fixed only after lengthy negotiations. The total quantity distributed was 464 tons. Manufacturers could use no more because of the lack of necessary compounding ingredients. Stocks in mid-July were estimated to be sufficient to last six months with a very restricted factory production.

The amounts of capital invested in Dutch rubber companies in recent years are of interest and were as follows: 1913, \$908,520; 1914, \$270,375; 1915, none; 1916, \$322,600; 1917, \$2,003,970; 1918, \$779,880.

Rubber goods manufacture seems likely to be stimulated by the newly established cotton exchange of the Rotterdam Cotton Association, which promises to become a formidable competitor of the Bremen exchange. Although the textile industry of the Netherlands has been an important one, Dutch spinners before the war covered their requirements principally in Bremen and to a limited extent in Liverpool. Becoming dissatisfied with the practices of the Bremen merchants in 1915, the new Rotterdam cotton exchange was the result. Several large firms have engaged in the business; leading dock companies have constructed big modern cotton warehouses along the Meuse; the principal steamship companies will operate direct lines to Galveston and New Orleans at rates not above those to Bremen, and a guaranty fund has been pledged by Dutch merchants and spinners to defray the heavy initial expenses of the exchange. The Rotterdam rules have been established on the basis of Washington and Liverpool standards, but on the whole they correspond with the Bremen rules, as Continental buyers and American shippers are fully accustomed to them.

Rotterdam enjoys excellent shipping facilities essential to the success of this project. Much cheaper freight rates are obtainable on the rivers Rhine and Meuse to Belgium, the west and south of Germany, Alsace, Switzerland, and even to Austria and Italy, than those by rail from Bremen. Rotterdam also owns several regular direct steamship lines to Denmark, Norway, Sweden, Russia and the Baltic ports of Germany, so that in these countries the new exchange may compete favorably with Bremen.

A PLANTATION RUBBER KNIFE.

There is a variety of tapping tools in use at the present time on rubber plantations and all possess practical merit under certain conditions. The tool here illustrated is a type that includes simplicity in construction, adjustment, manner of use and in sharpening.

It is a modified farrier's knife with a strong tool-steel blade and provided with a "fool proof" adjustable gage for regulating the depth of the cut. The curve of the cutting edge is

ELECTRO TAPPING TOOL.

designed for the purpose of effective cutting and paring, and when necessary the renewal of the edge by sharpening in the usual manner. The handle consists of two hardwood sections, that are riveted to the shank of the blade. (Thomas Newey & Sons, Limited, Birmingham, England.)

COMBINED LATEX CUP SUPPORT AND SPOUT.

This spout-cup bearer is made according to the idea of J. H. Recoert, Soember-Tjoeling, Dampit, Java. The advantages of this invention over all others are that it is suitable for any kind of cup; it does not wound the tree; no hard rubber, less scrap; the cup is easily seen; the tappers have not the slightest trouble with removing and putting back the cups.—(Netherland Indies Metal Ware & Packing Co., Malang, Java.)

SPOUT CUP BEARER.

THE DELFT RUBBER INSTITUTE.

The Netherland Government Institute for Advising the Rubber Trade and the Rubber Industry was established at Delft some years ago, under the patronage of the International Association for the Cultivation of Rubber in the Netherlands Indies, through the exertions of Professor G. van IJterson. In 1912 the first report and notes of the Institute appeared. A second instalment of notes appeared in 1916, making a volume of 500 pages, abstracts of which were published in English in 1917.

The object of the Institute is to place crude rubber commercial transactions on a scientific basis; to advise producers how crude rubber should be prepared; and to inform the trade how various crude rubbers should be treated.

The Batavia Exposition in 1914, enabled it to analyze samples and to compare the results of its investigation with those reached by the rubber brokers. Since then it has directed its attention to simplifying and shortening the examinations. Similar laboratories have been established in Java, at Kuala Lumpur in the Federated Malay States, and at the Imperial Institute, in London.

NOTES FROM THE FAR EAST.

THE MEDAN COMMERCIAL ASSOCIATION states that the total area planted with rubber in the Sumatra East Coast district, including the Atchin east coast, at the end of June, 1919, was 133,543 hectares, of which 71,415 hectares were producing rubber. The whole area, despite unfavorable circumstances, has increased by 10 per cent.

The Ceylon Department of Agriculture has appointed an inspector with three sub-inspectors under him to watch the rubber plantations on the island for diseases and insect pests. They are to suggest measures for fighting these when discovered, and to urge the planters to join the official campaign of cure and prevention.

From Padang in Sumatra, 284,800 pounds of gutta percha were exported in the first six months of 1919, against 85,891 pounds in the same period of 1918.

The Dutch East Indies in the quarter ended September 30, 1919, exported to the United States 5,515,840 pounds of rubber valued at \$2,165,015; 38,334 pounds of jelutong, valued at \$3,624, and 4,145 pounds of gutta percha, valued at \$1,051.

Calcutta has started a bus service employing 200 vehicles equipped with tires specially constructed to meet the difficulties of Calcutta roads.

India imported rubber tires in the four months from April to August, 1919, to the value of 3,560,000 rupees; of these the United States supplied 1,145,000 rupees worth and Japan 9,000 rupees worth. One rupee equals \$0.32 United States currency.

Burma's largest ten rubber plantations produced 1,142,383 pounds of rubber in the first six months of 1919. The exports of rubber in those months amounted to 2,206,527 pounds valued at \$836,052, compared with 1,340,074 pounds, valued at \$808,831, exported in the first six months of 1918.

In Burma the Government has decided to advance 100 rupees at 6½ per cent. interest for every acre that is planted with rubber, with the hope of restoring the importance of the industry.

While the chief commercial product of the Fiji Islands is sugar and something is done in copra, the British administrators expect that the new rubber industry will become one of the most important. There are 225 islands in the group, 80 of which are inhabited, the largest being Viti Levu, on which is Suva, the capital and chief port. While there is steamer communication with Australia, New Zealand and Canada and the trade with the United States is by schooners, anxiety is expressed about American competition in Fiji, and still more is felt about Japanese enterprise.

Rubber conditions in Indo-China were in a bad state in the last half of 1918, owing chiefly to the French Government's prohibiting the exportation of rubber to any country but France, which coincided in point of time with the impossibility of securing freight steamers and the very unfavorable course of exchange. Besides this the carelessness and inexperience of many planters sent rubber to the market that was irregular in quality, and especially in appearance. The result was a crisis which piled up 25,000,000 francs worth of rubber in storage and came near making many plantations give up work. A few orders amounting to about 1,200 tons, secured by the efforts of M. Garnier of the Marseilles Colonial Institute, have saved the situation to a certain extent. The planters have decided to organize their industry better and to establish a laboratory at Saigon.

Exports from Sumatra East Coast in 1919 exceeded by far those of previous years, as is shown by the figures compiled by the Medan Chamber of Commerce:

Exports.	1918.	1919.
Hevea	kilos 19,445,447	38,185,935
Ficus elastica	361,840	182,136

The *Hevea* rubber exports were 96 per cent more than in 1918. The increase is due to increased production, that for 1919 being over 36,000 tons, while the 1918 production was abnormally small, owing to the intentional restrictions. The stock on hand was 4,000 tons at the beginning and 1,000 tons at the end of 1919.

The Incorporated Society of Planters at Kuala Lumpur in the Federated Malay States, formed in October, 1919, has 237 members, and at the January meeting elected officers, as follows: Chairman, A. B. Milne, Ipoh; vice-chairman, H. Nixon, Malacca; secretary, C. Ward-Jackson. It is the first association of planters to be formed in Malaya, though there is a similar organization in Southern India. The object of the association is not commercial, but to promote the mutual welfare and to bring the planters and the companies that employ them into greater harmony of purpose.

RUBBER TREE DISEASES.

WHEN the number of diseases and enemies to which rubber trees are subject are considered, the casual observer is inclined to wonder how rubber trees manage to survive at all. It is something like the study of a medical treatise by which the reader can easily persuade himself that he has symptoms of almost every known complaint. Fortunately, however, as in the latter case, all diseases do not attack every tree or every plantation at once. To-day brown bast easily takes first place among the enemies of rubber plantations. So far as the general public is concerned, this is practically a new disease. In point of fact, however, it has been known for many years, but only recently has attention been drawn to it to any considerable extent. In the old days when plantations were closely planted, it was a simple matter to eliminate altogether trees effected with this fatal disease. With the wider planting now generally practiced every

tree counts for a tree, and, as every rubber shareholder knows, the question has recently assumed considerable prominence.

The first sign of brown bast is a big increase in the latex yield of the tree affected, but this soon diminishes and ultimately ceases altogether. The bark discolours and hard burrs appear, and if the disease is neglected the tree becomes useless. The disease is very prevalent throughout the East, few estates having less than 5 per cent and some as high as 60 per cent of their trees affected. Curative methods such as resting, liming and manuring have been tried without success and the only remedy known so far is that

("The Rubber Age," London.)

ADVANCED STAGE.

FINAL STAGE.

BROWN BAST.

of stripping the bark from the portions attacked, afterwards shading the cambium until a new growth of bark has developed. It is obvious that a disease of this kind is likely to exert a powerful influence on overproduction and should no remedial measures be found its increase at the worst might involve wholesale replanting of trees in from 15 to 20 years' time.

Up to quite recently brown bast was described as a physiological disease of the tree, the term in reality being only a confession of ignorance as to its true nature. It was supposed to be due to the effects of tapping and has been compared with anemia in a human being. Recently, however, a mycologist in Sumatra claims to have isolated a definite bacterium to which the disease is due, and should further research support this discovery, the search for a remedy would appear to be not so hopeless once the cause is known.

Among other diseases with which estates are troubled may be placed in order after brown bast, the well-known *Fomes*, *Ustulina*, pink dieback, striped canker, and a new enemy called patch canker, while it is well known that any diseased wood is liable to attacks from white ants. Apart from brown bast, however, which has so far defeated the best efforts, most of these diseases are well understood and can be adequately treated if taken in time.

ELCH GUM IN KURDISTAN.

In the part of Kurdistan which is now in British hands, at the head waters of the Tigris, a gum, resembling the lower grades of gutta, is obtained from a tree which the Arabs call *Buttom* and the Kurds, *Gkraswam*. The gum is called *elch* (in Arabic and is obtained by tapping the tree, just as rubber trees are tapped. The tree produces also fruit which is used for food and is pressed for the oil it contains. The elch gum is transported to Aleppo and also to Bagdad; it is used for sizing cloth and as chewing gum, and also as medicine and in making arrack liquor from dates. The trees grow only in the valleys and attain a height of 50 feet and a girth of 8 feet.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED APRIL 13, 1920.

- N** 1,336,452. Solid tire. H. K. Wheelock, Long Beach, Calif.
 1,336,527. Door buffer of sheet rubber. S. G. Lewis, Greensburg, and G. W. Daum, Jeannette—both in Pennsylvania.
 1,336,531. Demountable rim for tires. J. C. Manterich, assignor by mesne assignments to The Standard Parts Co.—both of Cleveland, O.
 1,336,572. Fountain pen. C. A. Luck, assignor to The Conklin Pen Manufacturing Co. both of Toledo, O. (Original application divided.)
 1,336,601. Dirigible balloon. R. H. Upson, assignor to The Goodyear Tire & Rubber Co., both of Akron, O.
 1,336,663. Pneumatic tire. E. M. Story, Braintree, Mass.
 1,336,746. Rubber-dam clamp appliance. J. W. Ivory, Philadelphia, Pa.
 1,336,962. Rubber sandal. P. A. Joseph, assignor to L. Candee & Co.—both of New Haven, Conn.
 1,337,178. Receptacle for pneumatic tire tubes. M. F. Sacer, Jamestown, Calif.
ISSUED APRIL 20, 1920.
 1,337,211. Milking machine test cup. J. G. G. Eklund, C. Oden, and J. A. Schmidt, assignors to The Universal Milking Machine Co., all of Columbus, Ohio.
 1,337,225. Artificial respirator. C. L. Heald, Cedar Rapids, Iowa.
 1,337,288. Fuel hose for gas fixtures. C. Stichter, assignor to Strause Gas Co.—both of Philadelphia, Pa.
 1,337,289. Resilient tire. J. G. Summers, San Diego, Calif.
 1,337,316. Pneumatic tire valve. J. O. Hellwell, Pasadena, Calif.
 1,337,443. Resilient reinforced non-skid tire. D. J. Demas, Pittsburgh, Pa.
 1,337,446. Demountable sectional rim for tires. M. A. and L. M. Endres, Cross Plains, Wis.
 1,337,528. Spring plate tire filler. J. H. North, Blackwood, N. J.
 1,337,606. Dust cap for tire valves. A. L. Just, Syracuse, N. Y.
 1,337,660. Pneumatic tire. E. B. Killen, London, England.
 1,337,661. Pneumatic tire. E. P. Strepski, Columbia, O.
 1,337,962. Rubber and fiber composition heel-plate for shoes. Hugh G. Robinson, Philadelphia, Pa.

ISSUED APRIL 27, 1920.

- 1,338,011. Armored pneumatic tire. B. Granville, New York City.
 1,338,054. Dust cap for tire valve stems. W. E. Vollmer, Sandusky, O.
 1,338,072. Demountable rim for tires. R. R. Craft, Norfolk, Nebr.
 1,338,110. Demountable rim for tires. B. A. Stocking, Boone, Iowa.
 1,338,145. Demountable rim for tires. E. M. Peterson, assignor to J. Rosenthal, both of Beaumont, Tex.
 1,338,184. Combination rubber stamp and pen rack. L. B. Lindquist, Maida, N. D.
 1,338,245. Tire valve. E. V. Myers, East Orange, N. J., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
 1,338,390. Demountable rim for tires. W. M. Kraft, Jackson, Mich., assignor to Perlman Rim Corp., New York City.
 1,338,464. Douching tip. M. M. Shafer, Los Angeles, Calif.
 1,338,578. Cushion tourmouret. R. Macda, Seattle, Wash.
 1,338,584. Cushion horseshoe. E. H. Paar, Canton, assignor of one-third to C. McGranahan, Youngstown—both in Ohio.
 1,338,595. Pneumatic tire with supplementary tire within inner tube. W. J. Stoltz, St. Louis, Mo.
 1,338,629. Fountain-pen. C. E. Hood, Memphis, Tenn.

ISSUED MAY 4, 1920.

- 1,338,677. Demountable and fixed rims for tires in combination. T. E. Cook and A. T. Freije, Rincon, N. Mex.
 1,338,710. Douche nozzle. E. V. Szepesky, Detroit, Mich.
 1,338,817. Cushion heel. P. A. De Luca, New York City.
 1,338,838. Lady's garter. M. de Los S. Enriquez, New York City.
 1,338,905. Anaesthetic apparatus. A. C. Clark, assignor to A. C. Clark & Co.—both of Chicago, Ill.
 1,338,986. Rubber and metal hoof protector for horses. W. J. Kent, Brooklyn, N. Y., assignor to The Mechanical Rubber Co., a New Jersey corporation.
 1,339,216. Windshield cleaner. L. H. Morse and J. J. Tracy, Cleveland, Ohio; said Morse assignor, said Tracy, assignor.
 1,339,241. Duplex windshield cleaner. H. C. Trip, Auburn, N. Y.
 1,339,283. Sectional inner tube for tires. J. A. Perkins, Brooklyn, N. Y.

THE DOMINION OF CANADA.

ISSUED APRIL 6, 1920.

- 1,338,900. Pneumatic seat cushions. G. L. Chase, Seattle, Washington, U. S. A.
 1,338,930. Cushion heel with protecting plate. H. Glover, South Acton, Mass., U. S. A.
 1,339,093. Sectional tire with removable blocks of rubber, etc., to facilitate replacement and also provide for insertion of alternative projecting studs for use on soft ground. L. Feuillette, Boulouze sur Seine, France.
ISSUED APRIL 13, 1920.
 1,339,105. Tire package. E. H. Angier, Framingham, Mass., U. S. A.
 1,339,116. Electric repair pad vulcanized for pneumatic tires. D. E. Booth, Tulsa, Okla., U. S. A.
 1,339,119. Dust cap and sleeve for inflating tubes. E. O. Collins, Chillicothe, Ohio, U. S. A.
 1,339,144. Dust cap for tire valves. A. L. Just, Syracuse, N. Y., U. S. A.
 1,339,147. Dust cap for tire valves. H. P. Kraft, Ridgewood, N. J., U. S. A.
 1,339,148. Tire valve. H. P. Kraft, Ridgewood, N. J., U. S. A.
 1,339,149. Inflating coupling. H. P. Kraft, Ridgewood, N. J., U. S. A.
 1,339,159. Tire valve cap. W. P. McComb, Conroe, Tex., U. S. A.
 1,339,165. Blow-off valve for tire inflating tubes. E. W. Phillips, Delta, O., U. S. A.
 1,339,204. Blow-off and hose connection for tires. The Automatic Suture Tire Valve Corp., New York City, assignee of S. Kahn, Newark, N. J.—both in U. S. A.

Patented. Dust cap for tire valves. A. Schrader's Son, Inc., New York City, assignee of F. Nielsen, Dordrecht, Mass., both in U. S. A.

ISSUED APRIL 20, 1920.

- 1,339,261. Demountable rim for tires. N. L. Baker, Minneapolis, Minn., U. S. A.
 1,339,262. Demountable rim for tires. N. L. Baker, Minneapolis, Minn., U. S. A.
 1,339,298. Armored pneumatic tire of rubber and fabric. G. R. Granzow, Thompson, Iowa, U. S. A.
 1,339,306. Pneumatic tire. P. L. Hedges, Charleston, Ill., U. S. A.
 1,339,326. Vagrine machine. T. H. Larsen, Oshkosh, Wis., U. S. A.
 1,339,429. Removable resilient pad for crutches, artificial limbs, etc. F. C. Lynde, Manchester, England.
 1,339,438. Pneumatic tire. H. Nicholson, Chicago, Ill., U. S. A.
 1,339,440. Demountable rim for tires. W. H. Fox and B. W. Japs, assignee of one-half interest—both of Minneapolis, Minn., U. S. A.
 1,339,441. Pneumatic tire. J. A. Johnson, Indianapolis, Ind., U. S. A.

ISSUED APRIL 27, 1920.

- 1,339,482. Gum and mint case. L. W. Buchanan, Stockton, Calif., U. S. A.
 1,339,499. Cushion tire. F. Dufield, Montreal, Quebec, Canada.
 1,339,520. Lumberman's rubber balmoral having water-tight tongue vulcanized in one with body. C. L. Grant, Grande Pre, Nova Scotia, Canada.
 1,339,527. Pneumatic tire having layers of sponge rubber disposed between outer casing and inner casing, and inner casing and inner tube, the layers being vulcanized to inner casing to form a homogeneous structure. L. Hofmeister, Milwaukee, Wis., U. S. A.
 1,339,573. Rubber heel cushion formed in two parts made integral, one being more resilient than the other. J. Pietzuch, Cincinnati, O., U. S. A.
 1,339,665. Shower bathing apparatus of perforated tubing, etc. The Simplex Shower Bath Co., assignee of H. W. Patrick—both of Mansfield, O., U. S. A.

THE UNITED KINGDOM.

ISSUED APRIL 8, 1920.

- 1,338,393. Pneumatic tire with reinforced tread. J. F. F. W. Ure, 13 Trinity Gardens, Folkestone, Kent.
 1,338,399. Revolvable rubber heel. A. E. and F. J. Lancaster, 212 Bristol Road, Birmingham.
 1,338,520. Rubber corn shield. W. R. Edwards, 15 Earl street, Maidstone, Kent.
 1,338,553. Pneumatic tire. W. C. Whalley and J. A. Andrews, 4 Marlton avenue, Great Crosby, Liverpool.
ISSUED APRIL 14, 1920.
 1,338,630. Pipe couplings. Titeflex Metal Hose Corp., Badger avenue, Newark, assignee of W. H. Fulton, Irvington—both in New Jersey, U. S. A. (Not yet accepted.)
 1,338,631. Gas masks. M. Meyer, 4 Nymphenburgerstrasse, Schonberg, Berlin. (Not yet accepted.)
 1,338,638. Gas masks. M. Meyer, 4 Nymphenburgerstrasse, Schonberg, Berlin. Addition to No. 138,631. (Not yet accepted.)
 1,338,694. Combined pressure gage and relief valve for tires. W. E. Beasley, Rose Cottage, Cheddington, Buckinghamshire.
 1,338,717. Demountable rim for tires. W. Armaly, 20 Smeaton Boulevard, Nottingham.
 1,338,781. Demountable rim for tires. J. Knight, 9 Caldry Road, Aintree, Liverpool.
 1,338,791. Solid tire. G. Jackson, The Cedars, Albert Road, Wolverhampton, A. J. Stevens, Hickman, Beech Tree House, Wall Heath, near Dudley—both in Staffordshire.
 1,338,789. Fountain pen. A. A. Peace, 30 Loreburn Road, Wavertree, Liverpool.
 1,338,794. Soles and heels for boots, having air cells and insertions of vulcanized asbestos composition to prevent slipping. M. T. M. Byrne, 333 St. John street, and G. H. Long, 122 Upper street, Islington—both in London.

ISSUED APRIL 21, 1920.

- 1,339,076. Pneumatic tire valve. A. C. Wright and Warner, Wright & Rowland, Keeley street, Watery Lane, Birmingham.
 1,339,117. Device for closing the neck of a toy balloon after inflation. W. F. Ingram, 165 Farnell Road, Old Ford, London.
 1,339,206. Marking pens and brushes. C. A. Garvey, Clayton, Mo., U. S. A. (Not yet accepted.)
 1,339,331. Foot-pad for motorcycle pedals. A. J. Stevens & Co. and A. J. Stevens, Graisley House, Penn Road, Wolverhampton.
 1,339,356. Dust cap for tire valves. G. B. Ellis, 70 Chancery Lane, London. (A. Schrader's Son, 783 Atlantic avenue, Brooklyn, N. Y., U. S. A.)
 1,339,374. Motorist's cap with elastic lining. M. and N. Deniger, trading as Empire Cap Works, Derby street, Cheetam, Manchester.
 1,339,450. Resilient wheel with pneumatic tire and tread band formed of strips of hard rubber alternating with strips of softer rubber, both resting on a bed of hard rubber, etc. A. A. Darche, Edith Cavell Road, Alger, Algeria. (Not yet accepted.)
 1,339,471. Elastic tire supporter. D. Kops, 525 West End avenue, New York City, U. S. A. (Not yet accepted.)
 1,339,500. Spring wheel with pneumatic tube. M. T. Weston, 300 Fifth avenue, New York City, U. S. A. (Not yet accepted.)
 1,339,562. Cord fabric for covering pneumatic tires. C. L. Marshall, 27 Queen Victoria street, London.
 1,339,624. Tobacco pouch with rubber-lined pocket. W. J. Beeby, Everstep Road, Small Heath, Birmingham.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 500,432. (October 26, 1918.) Soling of rubber, combined with any substance that reduces its elasticity. *Société Française de Cuir Artificiel.*
- 500,450. (June 12, 1919.) Rubber-covered cord. *S. G. Lewis.*
- 500,436. (June 19, 1919.) Improvements in pneumatic tires. *A. P. R. Forté.*
- 500,468. (June 14, 1919.) Shoes with vamp made of waste wrappings of pneumatic tires and other rubber articles. *Société Kunst- und Gummi-Fabrik.*
- 500,477. (June 20, 1919.) Inflating valve for pneumatic tires. *Etablissement L. Rosemberg.*
- 501,060. (June 25, 1919.) Valve for pneumatic tire. *T. A. Low.*
- 501,059. (June 26, 1919.) Improvements in pneumatic tires. *F. W. Lancaster.*
- 501,341. (June 10, 1919.) Improvements in revolvable rubber and other kinds of heels. *J. Cleret, avenue d'Alphard, Saint-Mande.*
- 501,525. (July 7, 1919.) Valve for pneumatic tires. *T. A. Low.*
- 501,535. (July 5, 1919.) Improvements in elastic tires. *G. Negri.*
- 501,753. (July 18, 1919.) Perfected resilient tire. *C. C. Crump.*
- 502,104. (July 30, 1919.) Safety device for pneumatic wheels. *O. Englebert & Cie.*

GERMANY.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 321,276. (September 12, 1915.) Pneumatic tire. *A. A. Pancera, Genoa, Italy.*
- 321,359. (January 18, 1912.) Pneumatic tire. *E. B. Killen, London.*
- 321,439. (July 20, 1913.) Belting. *A. Jonas & G. Getting, St. Denis, France.*
- 321,753. (March 18, 1919.) Packing ring. *G. Bunge, Kücknitz, near Lauenburg.*
- 321,890. (January 15, 1919.) Bandage. *H. Garoli, Lahrb, Baden.*

TRADE MARKS.

THE UNITED STATES.

- N O. 113,134. The **WIP-BLADDED TIP**—rubber heels. *United Lace & Braided Manufacturing Co., Cranston, R. I.* (See *THE INDIA RUBBER WORLD*, AUGUST 1, 1919, page 638.)
- 116,015. The words **DEBACARD HAND SERVICE CABLE** above a horizontal line, electric portable cables protected by rubber—impregnated woven insulation. *Tubular Woven Fabric Co., Pawtucket, R. I.* (See *THE INDIA RUBBER WORLD*, February 1, 1920, page 399.)
- 117,024. The words **DIURA-SEY**—insulated-wire conductors. *Tubular Woven Fabric Co., Pawtucket, R. I.*
- 117,403. The words **GOLATIAN** and **THE GENERAL RUBBER GOODS CO., CLEVELAND, OHIO**, contained within a diamond—belting, hose and packing. *The General Rubber Goods Co., Cleveland, O.*
- 117,655. Representation of a leaf and flowers of lily of the valley and the word **LILY** on a scroll around the stems—elastic webs. *Faire Bros. & Co., Limited, Leicester, Eng.*
- 117,787. The words **ELICA**, a scroll within a circle separated by the representation of a tire and underneath the tire the words **THE PATCH THAT SEALS**—self-cure vulcanizing tire patch. *Vulca Laboratories, San Francisco, Cal., New York City.*
- 117,658. Representation of a pansy above the word **PANSY**—elastic webs. *Faire Bros. & Co., Limited, Leicester, Eng.*
- 119,348. Representation of a Liberty cap bearing five stars on the head-band, above a horizontal line over the word **LISCO**, all within the conventionalized outline of a shield—rubber tires. *Liberty Steel Products Co., Inc., New York City.*
- 119,707. The stencilled letters **I. BECO**—rubber belting, hose, packing, etc. *Imperial Belting Co., Chicago, Ill.*
- 120,778. The word **LSGO**—floor covering now made of rubber compound. *United States Rubber Co., New Brunswick, N. J., and New York City.*
- 121,460. The words **BOONE TIES** separated by a picture of the pioneer Daniel Boone, inclosed within a circle above a scroll—rubber and canvas tire casings. *Boone Tire & Rubber Co., Chippewa Falls, Wis.*
- 121,896. The words **REXALL** in stencilled letters—elevator, conveyor, or transmission belting of rubber, etc. *Imperial Belting Company, Chicago, Ill.*
- 122,997. The words **ROVER** in a fibrous rubber mat for floors, automobiles, running boards, etc. *Rub-Tec Organization Co., Kenton, O.*
- 123,366. A red line beneath the words **RED SEAL**—inner-tube repair outfits. *Red Seal Rubber Manufacturing Co., Oklahoma, Okla.*
- 124,015. The words **FLINT-ROCK** within a white diamond superimposed on a black disk, enclosed by a circle—belting, hose, packing, etc. *Chicago, Ill.*
- 124,915. The words **OUTLOOK**—wind-shield cleaners of the squelgee type. (See *THE INDIA RUBBER WORLD*, April 1, 1919, page 413.)
- 125,155. The letter **X** above the letter **J**, with a horizontal line between—leather shoes with rubber soles and heels. *Jureidini Export Co., New York City.*
- 125,162. The word **NORWALK** superimposed on a panel picture of a fleet of yachts against a background of sea and clouds, the panel being in turn superimposed on a tire with the words **FLOATING STOCK** between the panel and the lower part of the tire—rubber tires. *The Norwalk Tire & Rubber Co., Inc., Norwalk, Conn.*
- 125,261. The initials and words "**W. L. TEDFORD'S SUPER SERVICE PATCH, KEEPS A KAY IN YOUR KAY**," the initials and words "**W. L. TEDFORD'S**" being a facsimile of the applicant's signature—tires, tubes, and casing-patch. *W. L. Tedford, Little Rock, Ark.*
- 125,964. The words **BLACK BEAUTY**—rubber water-bags and rubber bottles. *The Miller Rubber Co., Akron, O.* (See *THE INDIA RUBBER WORLD*, March 1, 1919, page 353.)
- 126,022. The words "**QUESTER**" in hyphen being formed by an extension of the cross-piece of the first "**e**"—printing-press ink rollers. *The B. F. Goodrich Co., New York City.*
- 126,154. Representation of a black-outlined rectangle bisected vertically by a single heavy line extending above and below—brake linings. *Thermoid Rubber Co., Hamilton Township, Mercer County, N. J.*
- 126,131. The word **RELCO** within an oval beneath the word **RELIABLE**, and at the right and left, respectively, of the oval, the words

- RELIABLE**, **U. S. PAT. OFFICE** and **NEW YORK, U. S. A.**—fountain pens. *Abraham Harris, New York City.*
- 126,436. The word **GRIZLEYBEAR**—a duplex crinkled or creped paper for wrapping tires, etc. *Angier Mechanical Laboratories, Framingham, Mass.*
- 126,572. The words **MOS ECON**—elevator belts made of rubber reinforced with fabric. *The B. F. Goodrich Co., New York City.*
- 126,606. The word **JOLIE** above representation of head of Joliet—jar rubbers. *Walker-Materson Co., Joliet, Ill.*
- 126,586. The words **ALSOA**—rubber shoe rubber and fabric tires and tubes. *McClaren Rubber Co., Charlotte, N. C.*
- 126,793. Representation of an Indian arrow-head in silhouette pointing to the right—rubber boots, shoes, etc. *Nathaniel Fisher & Co., New York City.*
- 127,121. The word **CLIMAX**—arm-pit dress shields and diaper supporters. *M. J. George, St. Louis, Mo.*
- 127,503. The words **REST-ASSURED** inclosed in an oval formed by the end of the letter **R**—rubber boots and shoes, etc. *Nathaniel Fisher & Co., New York City.*
- 127,722. The words **KENYON COB**—rubber tires and tubes. *C. Kenyon Co., Brooklyn, N. Y.*
- 127,750. The letter **A** within the outline of a club-sput—hard rubber battery jars, insulations, etc. *American Hard Rubber Co., Hempstead and New York City, N. Y.*
- 128,138. The words **BRITANN**—combined rubber, leather, and fabric shoes and slippers. *A. J. Bates & Co., Inc., New York City.*
- 128,290. The word **AMICUS**—rubber boots and shoes and boots and shoes made wholly or partially of rubber. *American National Shoe & Leather Corp., New York City.*
- 128,492. The word **DEFIANCE**, combined with conventionalized sprays of leaves and a knot of ribbon, formed by the word **DEFIANCE**—hard or semi-hard rubber battery jars. *The B. F. Goodrich Co., New York City.*
- 128,494. The letter **E**, framed by conventionalized sprays of leaves and a knot of ribbon—hard or semi-hard rubber battery jars. *The B. F. Goodrich Co., New York City.*
- 128,495. The word **DEFIANCE** above the letter "**Q**" framed by conventionalized sprays of leaves and a knot of ribbon—hard or semi-hard rubber battery jars. *The B. F. Goodrich Co., New York City.*
- 129,152. Representation of a section of belting having a copper thread or wire laid or woven longitudinally in it—rubber and other kinds of belting having a copper thread or wire woven or laid in them longitudinally. *The Rosendale-Redway Belting and Hose Co., Newark, N. J.*

THE DOMINION OF CANADA.

- 126,133. Circular device comprising the outer concentric circles and arbitrary inner circular arrangement of stripes forming a fantastic and distinctive simulation of the word **RELIABLE**—insulated-wire conductors. *Kelly-Springfield Tire Co., New York City.*
- 126,138. Representation of a maple leaf with the name, **THE MAPLE LEAF RUBBER COMPANY, LIMITED**, printed with distinctive arrangement underneath and presenting a suitable base for the leaf—Canadian Consolidated Rubber Company, Limited, Montreal, Que.
- 126,214. The letter "**P**"—rubber tires, soft rubber goods, druggists' rubber sundries, etc. *The F. E. Partridge Rubber Co., Limited, Guelph, Ont.*
- 126,215. The word **PARTRIDGE**—same goods as No. 26,214. *The F. E. Partridge Rubber Co., Limited, Guelph, Ont.*
- 126,217. Representation of an inflated rubber tire with a partridge standing erect within the circle thereof and upon the inner edge of the tire the words **PARTRIDGE RUBBER CO., LIMITED, GUELPH, ONT.**
- 126,218. The letter "**N**"—same goods as Nos. 26,214 and 26,215. *The F. E. Partridge Rubber Co., Limited, Guelph, Ont.*
- 126,219. The word **NORTHEAN**—rubber tires, soft rubber goods, druggists' rubber sundries, etc. *The F. E. Partridge Rubber Co., Limited, Guelph, Ont.*
- 126,220. The letter "**P**"—rubber footwear. *The F. E. Partridge Rubber Co., Limited, Guelph, Ont.*
- 126,262. The word **ELASTICUS**—rubber insulators for electric wire splices. *The Elasticus Co., Hoboken, N. J., U. S. A.* (See *THE INDIA RUBBER WORLD*, March 1, 1920, page 366.)
- 126,279. The words **GEARED TO THE ROAD**—rubber tires and tubes. *The Miller Rubber Co., Akron, O., U. S. A.* (See *THE INDIA RUBBER WORLD*, March 1, 1919, page 311.)
- 126,289. The words **EL-HWEE**—clothing, heels and soles, vehicle and animal coverings, cloth, belting, hose, tires, insulating material, cement, druggists' sundries, etc., made wholly or partly of rubber or treated with substances containing rubber. *The Miner Rubber Co., Limited, Montreal, Que.*
- 126,290. The words **MINER**—same goods as No. 26,289. *The Miner Rubber Co., Limited, Montreal, Que.*
- 126,291. The words **RAIN KING**—same goods as Nos. 26,289 and 26,290. *The Miner Rubber Co., Limited, Montreal, Que.*
- 126,292. The word **FRONTENAC**—same goods as Nos. 26,289 to 26,291, inclusive. *The Miner Rubber Co., Limited, Montreal, Que.*
- 126,293. The words **FRONTENAC**—same goods as Nos. 26,289 to 26,292, inclusive. *The Miner Rubber Co., Limited, Montreal, Que.*

- 4,761. Tire. Patented April 13, 1920. M. J. Atkinson, Mimico, Ont.
- 4,762. Tire. Patented April 13, 1920. M. J. Atkinson, Mimico, Ont.

A COURSE IN INDUSTRIAL CHEMISTRY.

A four years' course in industrial chemistry will be started at the Cooper Union for the Advancement of Science and Art, New York City, on October 4, 1920. It will be a day course, and the intention is to make it practical as well as scientific, so that the young men and women who take it will be fully equipped as analysts, production foremen, research chemists, engineers, factory superintendents, purchasing agents, and for any pursuits that require chemical training. At the same time the proper foundation will be provided for those whose aim is original research and productive scholarship in industrial lines.

In the academic year 1920-1921 only the first year subjects will be offered. Horace G. Byers, head of the chemistry department of Cooper Union will supervise the course. He will be assisted by the staff, by such added instructors and lecturers as may be necessary, and by Dr. Maximilian Toch, recently appointed adjunct professor of applied chemistry in Cooper Union.

Review of the Crude Rubber Market.

NEW YORK.

THE LEADING FEATURES of the crude rubber market for the past month have been dullness and decline. Manufacturers have exhibited very little interest in the various market positions and have bought only in small lots. Large manufacturers have been more interested in the fabric than in the rubber situation.

Industrial operations generally have been seriously hampered by the long continued series of railroad strikes, car shortages and freight embargoes. These conditions have lessened demand as well as production in all lines and are the basic reasons for the lack of interest in crude rubber. A marked example of this is seen in the fact that transportation difficulties in the movement of raw materials and finished goods have forced rubber manufacturers in the Akron district to curtail their output practically 50 per cent by stopping work on Saturdays and discontinuing the night shift completely.

There has been some buying activity among crude rubber dealers who have been securing spot rubber to cover contracts as the market sagged off. Early in the month there was a large quantity of ribbed smoked sheets in New York, much of it shipped in from London storage.

The rubber markets in London and the Far East ruled firmer and higher than that in New York, where the impression has prevailed that large stocks of crude rubber in the hands of manufacturers and the congestion of shipping facilities will operate to send rubber prices lower. Prices for plantation and South American rubber at the beginning and toward the end of the month are shown in the following quotations:

PLANTATIONS. May 1, first latex crepe, spot, 43½ cents; May-June, 44 cents; July-September, 44-45 cents; July-December, 45-46 cents; October-December, 45½ cents; January-June, 1921, 47-47½ cents.

May 24, spot, 39 cents; May-June, 39 cents; July-September, 40 cents; October-December, 42½ cents; January-June, 1921, 44½-45 cents.

May 1, ribbed smoked sheets, spot, 43 cents; May-June, 43½ cents; July-September, 39¾-40¼ cents; July-December, 45½ cents; January-June, 1921, 47 cents; May 24, spot, 38½ cents; May-June, 38½ cents; July-September, 38¾-40¼ cents; October-December, 42¾ cents; January-June, 1921, 44¾ cents.

May 1, No. 1 amber crepe, spot, 45 cents; May-June, 43 cents; July-December 43 cents; May 24, spot and futures, 38 cents.

May 1, No. 1 rolled brown crepe spot, 34-35 cents; May-June, 33 cents; May 24, spot and futures, 30 cents.

SOUTH AMERICAN PARÁS AND CAUCHO. May 1, spot prices, upriver fine, 41¼ cents, islands fine, 42 cents; upriver coarse, 31 cents; islands coarse, 22 cents; Cameta coarse, 21 cents; cauchó ball, 31½ cents. May 24, upriver fine, 39 cents; islands fine, 40½ cents; upriver coarse, 28½ cents; islands coarse, 21 cents; Cameta coarse, 22 cents; cauchó ball, 30½ cents.

RECLAIMED RUBBER.

Owing to congested transportation conditions deliveries of re-claimed to the rubber manufacturers have been much curtailed during both April and May. Overdue stocks are now urgently sought and buying for future delivery has practically ceased for the time being.

Reclaimers have been forced by exhaustion of their fuel supplies to curtail operations or cease for weeks at a time. Conditions are now improving and the mills are resuming work as rapidly as possible under the circumstances.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Reers, broker in crude rubber and commercial paper, No. 1 Liberty Street, New York City, advises as follows:

"During May the demand for commercial paper has been rather limited, and entirely from out-town banks, rates on the best rubber names ruling at 7½ per cent. And those who so well known 7½ per cent. with occasional transactions at 8 per cent."

SINGAPORE RUBBER MARKET.
